This lab was an experiment designed to analyze how many cells could be observed in each part of mitosis for different areas of an onion root. First, with a prepared slide, area X and Y were located and each counted and recorded of what stages were observed. Then, another onion root tip was prepared and area Z was located.

the light to see the pointed ends of the root sections. This is the root tip where the cells were actively dividing. (The root tips were freshly sliced into thin sections, then preserved when the slide was prepared.) 2.

INVESTIGATING MITOSIS: ONION ROOT TIP LAB. Title:
Determining the Rate of Each Stage in Mitosis. Purpose:
To investigate and determine approximately how long each phase of mitosis takes in the cell cycle.

Introduction: Mitosis is the Page 7/17

process that allows multicellular organisms to exist; mitosis consists of Prophase, Metaphase, Anaphase, and Telophase.

When observing the onion root tip cells for the stage of prophase, the cells took on a brick-like structure and within the cells, small dots (the nuclei) can be seen. In one particular cell's nucleus, the chromatin has condensed so much that it can be seen using a light microscope. The stage that the cell is currently in is prophase.

experiment - YouTube Online Onion Root Tips. Growth in an organism is carefully controlled by regulating the cell cycle. In plants, the roots continue to grow as they search for water and nutrients. These regions of growth are good for studying the cell cycle because at any given time, you can find cells that are undergoing mitosis. In order to examine cells in the tip of an onion root, a thin slice of the root is placed onto a microscope slide and stained so the chromosomes will be visible.

An onion root tip is a rapidly growing part of the onion and thus many cells will be in different stages of mitosis. The onion root tips can be prepared and squashed in a way that allows them to be flattened on a microscopic slide, so that the chromosomes of individual cells can be observed easily.

root. The root tip is responsible for the downward growth of the root and is one of the regions in the plant where cells are actively dividing and growing. Because of this, the root tip is an excellent system in which to observe the entire cell cycle, including the processes of nuclear division (mitosis) and cell division (cytokinesis). You will be

Telophase is the final stage of mitosis. The divided chromosomes (sister chromatids) are now located at the opposite poles of the cell. The spindle fibers break down, the new nuclear envelope forms, and the Page 14/17

chromosomes relax (uncoil). The picture shows onion root tip cells.
