# Active Directory

**Integrating Repertoire Server with Active Directory**

The [Active Directory_Secondary_Authentication.pdf](Active Directory_Secondary_Authentication.pdf) highlights how the Repertoire Server is integrated with  Active Directory using **sAMAccountName** as the log in attribute.

In addition, for environments where the Repertoire Server and Active Directory reside on different platforms, a search and bind function is required to log onto Active Directory before carrying out the server authentication.

The following are covered -

   * Configuring the Repertoire Server
   * Input of active directory attributes
   * Search and bind
   * Frequently Asked Questions

**Note:** It is recommended to upgrade to version 7.3.x and above, if the above mentioned scenario fits your system requirements.
