William Shakespeare (1564-1616)

Hamlet

To be or not to be, that is the question:
whether 'tis nobler in the mind to suffer
the slings and arrows of outrageous fortune,
or to take up arms against a sea of troubles,
and by opposing, end them.¹

¹ Hamlet, III, i, 55-59.

Mark Knopfler (1949-)

Private investigations

It's a mystery to me,
the game commences,
for the usual fee, plus expenses;
confidential information,
it's in a diary;
this is my investigation:
it's not a public enquiry.

I go checking out the reports,
digging up the dirt;
you get to meet all sorts in this line of work.

Treachery and treason,
there's always an excuse for it;
and when I find the reason
I still can't get used to it.

And what have you got at the end of the day?
what have you got to take away?
a bottle of whisky and a new set of lies,
blinds on the windows
and a pain behind the eyes.

Scarred for life, no compensation:
private investigations.²

Louis de Rouvroy, duc et pair de Saint Simon (1675-1755)

**To know
whether it is permitted to write and read history,
in particular that of one's own time.**

From the preface of his memoirs, written in 1743.

Do these scrupulous people want us to believe that God demands of us what is opposed to himself? For he is light and truth. Would he ask of us that we blind ourselves in favor of the lie, out of fear to see the truth? Do they want us to believe that he has given us eyes to keep them fully closed to all events and people, that he has given us mind and reason to be used only to dull them and to make us completely coarse, stupid, and ridiculous, and perfectly incapable of being tolerated among even the most tolerant people?

Let us worship the Creator more reasonably, and let us not reciprocate the salvation which the Savior acquired for us with total dulling and the perfectly impossible. He is too good to want the one, and too just to require the other. Let us flee the extremes which only lead to the abyss, and, with Saint Paul, let us be more afraid of pushing our wisdom beyond its just limits than to measure it by sobriety. So let us use the faculties which it pleased God to give us, and let us not believe that charity forbids us to see all kinds of truths, and to judge the events and all that goes together with them. We must love ourselves at least as much as others. We owe ourselves at least as much charity as others: we must thus instruct ourselves, to avoid being dumb and stupid, and to be duped continually.

We should not fear, but endeavor to understand good and bad people, in order not to be cheated, and, on the basis of wise discernment, determine our conduct; for both are necessary, and depend on one another. Let's make a mirror of this knowledge, to form and determine our manners; flee, avoid, and detest what must be; like, esteem, and serve what merits it, and to approximate the ideal by imitation and noble or holy emulation.

So let us know, as good as possible, the merits of people and the price of things: the great difficulty is not to make mistakes in a world which for the major part is carefully concealed, and let us understand that knowledge is always good, but that good and bad depend on the use that is made of them. That is where scruples need to be applied, and where Christian morality and the extent of charity, in short the new law, must incessantly enlighten and contain our steps; and they should not be let loose on knowledge of which we cannot acquire enough.

The bad people who, in this world, already have so many advantages over good people, would have another rather strange advantage against them [= the good people], if it were not permitted good people to discern them, to know them, and consequently to avoid them, to inquire who they are, what they have done with respect to the events of life, and, if they played a small or important role, to show them to posterity as they are, and what they have been, when telling the history of their time. And on the other hand, as regards this world, the good people would be rather maltreated if they were to remain, like wild animals, exposed to the bad ones uninformed, and consequently without defense, and their virtue buried together with them. In this way, all truth would become extinct, all examples useless, all instruction impossible, and all providence restricted to the domain of faith, but destroyed in the eyes of men.

Let us therefore distinguish between what charity asks of us and what it does not ask, and what it does not want to ask because it does not want to ask anything harmful, and that its light becomes the mother of blindness. Charity, which asks us to love our neighbor like ourselves, by this command alone decides the question. By this command she forbids quarrels, harm, hate, insults, slander, piquant mockery, and scorn. All this concerns the interior emotions which one must repress in oneself, and the exterior effects of these things which are forbidden in social intercourse. It forbids to harm, and even wish to harm, anyone in any way; but, however absolute and comprehensive this command may seem to be, one has to acknowledge that it has its limits and exceptions. The same charity which imposes all these obligations does not forbid seeing things and people as they are; she does not demand, on the pretext that one should love people because they are our brothers, to love their faults, their vices, their bad designs, and their crimes; she does not ask us to expose us to them; she does not forbid, but even requires one to warn those whom they threaten, even those whom they regard; so that they can protect

themselves against them; and she does not forbid one to take all legitimate measures to safeguard oneself.

In the lives of the most venerated and illustrious saints everything is full of this practice. They did not hold back the discovery of the ugliest facts, nor the bitterest invectives against the malicious persons against whom they had to defend themselves or whom they believed they should discredit; and when I say malicious persons, this expression only means to exclude vague generality, and to show that they addressed persons of their own time, and sometimes with the highest positions in the Church or the world. The reason for this conduct is evident: it is that charity is only meant for the good, and, under this condition, for people; but, as soon as it detracts from the good and only concerns people, it is clear that charity is due to the good at the cost of the bad, whom it is not permitted to allow free scope to oppression nor to harm the good people, without warning and defending them, and making known as much as possible the tricks, bad intentions, dangerous conduct, and even the crimes of the bad, who, given free rein, become the masters of all their undertakings, and will surely always succeed against the good, and who, notwithstanding these aids, overpower them so often.³

From this explanation follows another: namely that the Christian, whom charity forbids to speak badly of, and to harm his fellow-creature, and to the full extent indicated above, is for the same reason obliged to do the opposite in certain cases, different again from those which were noted earlier. Those who have the confidence of the generals and ministers, and even more those who have the confidence of princes, may not leave them ignorant of the manners, conduct, and activities of men. They should let them know people as they are, to safeguard them against traps, surprises, and most of all against bad choices. This is a form of charity due to those who govern, and which in the first and most important place regards the public, which should always be preferred to the individual. The leaders of the public interest, as a whole or for a part, are too busy with public affairs, too circumvented, too flattered, too easily abused and cheated by the great interest to do so, to be able to properly disentangle and discern. They are wise if they let themselves be enlightened about the persons, and happy when they find true and faithful friends who prevent them from being seduced; and the public, or the part of the public which is governed, is much obliged to those enlightened advisers who protect it against many kinds of administrations from which it always has to suffer so much when they fall in bad hands. And it does not suffice for those who have the ear of the masters of the era to wait until they are consulted about certain bad people: they must know their master's tastes, their weaknesses, and the ambushes laid for them, and prevent them from falling into them. They must consider themselves placed for that purpose in the confidence of these masters of the era; and especially those who have the confidence of those favorites who can say everything should not neglect to inform them, and make themselves useful for society in this way. It is the same towards the close relations and the friends.

If it is obvious, as shown above, that charity allows self-defense, and even to attack malicious people; if it wants good people to be warned and supported; if it requires that those who have positions in public administrations are informed openly about people and affairs, although all these steps cannot be made without harming in a very direct and very radical way reputations and fortunes, then with more reason charity does not forbid to write, and consequently read, the general and particular histories.

³ The present author is not sure that he understood the original of this sentence correctly. The original may be linguistically and/or grammatically incorrect. The difficulty can be traced to the “de[s] personnes et de personnes”, and the “à qui”. Where the [s] indicates a difference between the editions of Boislisle (with the s) and Coirault (Pléiade).

William Lawrence Shirer (1904-1993)

The rise and fall of the Third Reich A history of Nazi Germany

From the preface.

Some may think that it is much too early to try to write a history of the Third Reich, that such a task should be left to a later generation of writers to whom time has given perspective. I found this view especially prevalent in France when I went to do some research there. Nothing more recent than the Napoleonic era, I was told, should be tackled by writers of history.

There is much merit in this view. Most historians have waited fifty years or a hundred, or more, before attempting to write an account of a country, an empire, an era. But was this not principally because it took that long for the pertinent documents to come to light and furnish them with the authentic material they needed? And though perspective was gained, was not something lost because the authors necessarily lacked a personal acquaintance with the life and the atmosphere of the times and with the historical figures about which they wrote?

In the case of the Third Reich, and it is a unique case, almost all of the documentary material became available at its fall, and it has been enriched by the testimony of all the surviving leaders, military and civilian, in some instances before their death by execution. With such incomparable sources so soon available and with the memory of life in Nazi Germany and of the appearance and behavior and nature of the men who ruled it, Adolf Hitler above all, still fresh in my mind and bones, I decided, at any rate, to make an attempt to set down the history of the rise and fall of the Third Reich.

"I lived through the whole war," Thucydides remarks in his *History of the Peloponnesian War*, one of the greatest works of history ever written, "being of an age to comprehend events and giving my attention to them in order to know the exact truth about them."

John Locke (1632-1704)

An Essay Concerning Human Understanding

Of the abuse of words

[...] language is often abused by figurative speech. Since wit and fancy find easier entertainment in the world than dry truth and real knowledge, figurative speeches and allusion in language will hardly be admitted as an imperfection or abuse of it. I confess, in discourses where we seek rather pleasure and delight than information and improvement, such ornaments as are borrowed from them can scarce pass for faults. But yet if we would speak of things as they are, we must allow that all the art of rhetoric, besides order and clearness, all the artificial and figurative application of words eloquence hath invented, are for nothing else but to insinuate wrong ideas, move the passions, and thereby mislead the judgment; and so indeed are perfect cheats: and therefore, however laudable or allowable oratory may render them in harangues and popular addresses, they are certainly, in all discourses that pretend to inform or instruct, wholly to be avoided; and where truth and knowledge are concerned, cannot but be thought a great fault, either of the language or person that makes use of them. What and how various they are, will be superfluous here to take notice; the books of rhetoric which abound in the world, will instruct those who want to be informed: only I cannot but observe how little the preservation and improvement of truth and knowledge is the care and concern of mankind; since the arts of fallacy are endowed and preferred. It is evident how much men love to deceive and be deceived, since rhetoric, that powerful instrument of error and deceit, has its established professors, is publicly taught, and has always been had in great reputation: and I doubt not but it will be thought great boldness, if not brutality, in me to have said thus much against it. Eloquence, like the fair sex, has too prevailing beauties in it to suffer itself ever to be spoken against. And 'tis in vain to find fault with those arts of deceiving, wherein men find pleasure to be deceived.⁴

Alexander I. Solzhenitsyn (1918-2008)

The Gulag Archipelago, Volume 2⁵

To taste the sea all one needs is one gulp.⁶

In the army even a fool and a nonentity can command, and, in fact, the higher the post he occupies, the greater will be his success. While a squad commander has to have a quick grasp of things, inexhaustible energy and courage, and understanding of the soldier's heart- it is quite enough for one marshal or another to be peevish, to curse, and to be able to sign his name. Everything else will be done for him, and the plan of operations will be brought him by the operations section of his staff, some bright officer with an unknown name. The soldiers will execute the orders not because they are convinced of their correctness (for often it is precisely the reverse), but because orders come from top to bottom through the hierarchy, and they are the orders of a machine, and whoever does not carry them out will have his head cut off.⁷

Out of one hundred natives [of the Gulag camps]- five are thieves, and their transgressions are no reproach in their own eyes, but a mark of valor. They dream of carrying out such feats in the future even more brazenly and cleverly. They have nothing to repent.⁸

Erasmus of Rotterdam (ca. 1467-1536)

To the illustrious prince Ernst, duke of Bavaria, 1517.

I admire the Alexander of the Greek history writers just as little as the Achilles of Homer; both are the worst example of a good prince, even though we could possibly find some good qualities between all their vices. Was it really worth while to make a carnage of Africa, Europe and Asia, only to indulge the wishes of a senseless young man, whose ambition could not be satisfied with the whole earth? It is quite good that fortune, otherwise not so compliant, denied these scourges a long life.⁹

⁹ Translated from the Dutch text on pp. 139-140 of *De correspondentie van Desiderius Erasmus (The correspondence of Desiderius Erasmus*, volume 5, Ad. Donker, Rotterdam, 2008), which was translated from latin by M. J. Steens. (This series does not present the correspondence, but only the letters sent by Erasmus).

Lev Nikolayevich Tolstoy (1828-1910)

War and Peace

Not only on that day, when he rode over the battlefield [of Borodino] strewn with men killed and maimed- by his will as he believed- did he, looking at them, calculate how many Russians had fallen for each Frenchman, and did he deceive himself into finding reason to rejoice about the conclusion that five Russians had fallen for every Frenchman. Not only on that day did he write in a letter to Paris that the battlefield was *superb*, because it was littered with 50,000 corpses; but even on the island of St. Helena, in peaceful solitude, where he had said that he wanted to devote his leisure to writing an account of his great deeds, he wrote:

«The Russian war should have been the most popular war of modern times: it was a war of good sense, for real interests: the tranquility and security of all; it was purely pacific and conservative. It was a war for a great cause, the end of uncertainties and the beginning of security. A new horizon and new labors would open out, full of well-being and prosperity for all. The European system was founded; all that remained was to organize it.

Satisfied about these great points and with tranquility everywhere, I too should have had my *congress* and my *holy alliance*. Those ideas were stolen from me. In that association of great sovereigns we would have discussed our interests as in a family, and rendered account to the peoples as clerk to master. In this way Europe would soon have become truly one single nation, and anyone traveling anywhere would have found himself always in the common fatherland. I would have asked freedom of navigation of all rivers, that the seas should be free for all, and that the great standing armies would be reduced to mere guards of the sovereigns.

Back in France, in the bosom of the great, strong, magnificent, quiet, and glorious fatherland, I would have proclaimed her frontiers immutable; all future wars purely *defensive*, and all new aggrandizement *anti national*. I would have associated my son in the Empire; my *dictatorship* would have ended, and his constitutional reign would have begun.

Paris would have been the capital of the world, and the French the envy of the nations!

My leisure then, and my old age, would have been devoted, in the company of the Empress and during the royal apprenticeship of my son, to visiting quietly and like a true country couple, with our own horses, all corners of the Empire, listening to complaints, redressing wrongs, and scattering monuments and benefactions everywhere.»

Napoleon, predestined by Providence for the gloomy role of executioner of the peoples, deluded himself into believing that his actions were aimed at the peoples' welfare, and that he controlled the fate of millions, and would use his power for the benefit of all!

«Of the 400,000 who crossed the Vistula», he later wrote about the Russian campaign, «half were Austrians, Prussians, Saxons, Poles, Bavarians, Wurttembergers, Mecklenburgers, Spaniards, Italians, and Neapolitans. Of the Imperial army in the strict sense, one third was composed of Dutch and Belgians living on the borders of the Rhine, Piedmontese, Swiss, Genevese, Tuscans, Romans, inhabitants of the 32nd military division, of Bremen, Hamburg, and so on; it included scarcely 140,000 men speaking French. The Russian expedition actually cost France less than 50,000 men; in the retreat from Vilna to Moscow and the various battles the Russian army lost four times as many men as the French army; the burning of Moscow cost the lives of 100,000 Russians, who died of cold and want in the forests; finally, in its march from Moscow to the Oder, the Russian army too suffered from the severity of the season; when it reached Vilna it numbered only 50,000 men, and at Kalisch less than 18,000.»

He imagined that the war in Russia was ruled by his will; and the horrors that it caused did not stagger his soul. He boldly took full responsibility for what had happened, and his blind mind found justification in the fact that among the hundreds of thousands who perished, there were fewer Frenchmen than Hessians and Bavarians.¹⁰

¹⁰ The quote is from chapter 38 of part 2 of book 3. The translation is based on pp. 2602-2607 of the edition of the Nalanda Digital Library of the Regional Engineering College (Calicut, Kerala State, India), and pp. 279-281 of volume 4 of the collected works of L. N. Tolstoy (G. A. van Oorschot, Amsterdam, 1966). The last translation is by H. R. de Vries.

Émile Zola (1840-1902)

Open letter to prime minister Henri Brisson, published in L'Aurore, 16 July 1898¹¹

Every morning, since six months, I feel my surprise and sorrow grow. I don't want to name persons, but I see them with my mind's eyes, everyone I once loved, admired, in whom I had vested my hope for the greatness of France. They can be found in your cabinet, mr. Brisson, they can be found in parliament, in the world of literature and the arts, in all social conditions. And it is my continuous wail: how can he, how can she, how can that one, how can they not be with us, for mankind, for truth, for justice? They seemed to be quite intelligent, and I believed them to be good-hearted. It confounds reason. The more so, since when one wants to explain their behavior to me by the need of certain political craftiness, I understand even less. Because it is quite certain, for everyone of common sense reflecting coolly, that these crafty people are running of their own accord to their nearby, inevitable, and irreparable ruin.

[...]

I believed you to be too well informed, mr. Brisson, not to be convinced, like me, that no cabinet can live, as long as the Dreyfus affair is not lawfully liquidated. There is something rotten in France; normal life will only return after medical intervention. And I add that the cabinet which will make the revision will be the great cabinet, the savior-cabinet, the one that will impose itself, and live.

You committed suicide therefore, as from day one, by believing you might base your power solidly and for a long time. And the worst is that, shortly, when you fall, you will have lost your political honor in the adventure; for I only think of you, I don't consider your subordinates, the minister of War and the minister of Justice, of whom you are the responsible chief.

A lamentable spectacle, the end of a virtue, this failure of a man in whom the Republic had vested its dream, convinced that this man would never betray the cause of justice, and who, as soon as he is boss, lets justice be murdered before his eyes! You just killed the ideal. That's a crime. Everything has a price; you will be punished.

Shall we take a look at the ridiculous comedy of an investigation you have permitted, mr. Brisson? We could have believed that the famous dossier would be put on the agenda of a cabinet meeting, and that all of you would examine it, joining your mental abilities, enlightening each other, discussing the files as they should be, scientifically. But no, not at all, the result unambiguously shows that no check or serious discussion has taken place, that the meeting has done no more than feverishly look not for the truth, but for those files which could best battle the truth, by impressing the simple of mind. It is well-known, this manner of studying a dossier in order to extract what can best serve a conviction obstinately established in advance. It is not a certainty that was discussed and proven, but only the hardheadedness of a man, placed in such personal mental and environmental circumstances, that his testimony has no historical value.

And see also what a pitiful result! What! You only found this? And, if you have nothing more to show, ardently desiring to vanquish us, must that not be due to the fact that you were unable to find anything better at the bottom of your bag? But we knew them, your three files; we especially knew the one that was so violently presented in the law court; the one that is the most unashamed and crude falsification that may fool the naïve. When I reflect that a general has come to seriously read this monumental mystification to a jury, that there was a minister of War who reread it to parliament, and that there was a parliament that let the piece be billboarded in all municipalities of France, I remain dumbfounded. I don't believe that something more stupid will ever leave its trace in history. And I really wonder to what state of mental aberration passion may reduce certain people, not more stupid than others undoubtedly, for them to attach the least credibility to a piece that seems to be the gamble of a falsifier trying to make fun of the people.

You probably realize that I am not going to discuss the two other files. One is tired of doing so, and of showing that they cannot apply to Dreyfus. And moreover, the necessity of revision remains

¹¹ Pp. 201-204, L'Affaire Dreyfus- «J'Accuse» et autres textes, composed and edited by Henri Mitterand, Livre de poche, 2010, ISBN 978-2-253-08872-1.

absolute, as soon as they have not been communicated with neither accused nor defense. The illegality is formal anyway; the Cassation Court has to annul the verdict of the military court. But you know these things just as well as I do, mr. Brisson, and that is precisely what stupefies me. Knowing this, how could you listen without shivering to the passionate assertions of your minister of War? What drama took place, in those minutes, in your conscience? Is it that you believe that politics is more important than everything else, that you are allowed to lie, to assure the country the welfare that your cabinet, according to you, brings to it? To believe that you are so unintelligent as to retain a shadow of doubt about the innocence of Dreyfus, is difficult for me; but on the other hand, to admit for a second that you sacrifice the truth, with the idea that the lie is necessary for the welfare of France, seems even more insulting. Ah! How I would like to read your mind, and how interesting it must be for a psychologist to see what happens in there!

[...]

And to conclude, let me amaze myself about the smallness of all of you [politicians]. If need be, I will assume that among you, there is no haughty and passionate lover of the idea, giving his life and fortune for the only joy of being just, and ready to withdraw when the truth has won. But you do have ambitions; in fact all of you are nothing but ambition. How then is it possible, that in your crowd, not at least one ambitious person steps forward, who has a vivid intelligence, audacity, and force, one of those ambitious persons with a wide and clear view, able to see the true role to play, and to play it courageously?¹²

¹² Because the present author did not know how to translate it in the given context, and because it did not seem to have significant added value, “à la main prompte” has been left out of the list of qualifications. The original has: «au coup d’œil clair, à la main prompte, capable de voir où est la vraie partie à jouer”».

Motörhead

Orgasmatron

I am the one, Orgasmatron, the outstretched grasping hand;
My image is of agony, my servants rape the land;
Obsequious and arrogant, clandestine and vain;
Two thousand years of misery, of torture in my name;
Hypocrisy made paramount, paranoia law;
My name is called religion, sadistic, sacred whore.

I twist the truth, I rule the world, my crown is called deceit;
I am the emperor of lies, you grovel at my feet;
I rob you and I slaughter you, your downfall is my gain;
And still you play the sycophant and revel in your pain;
And all my promises are lies, all my love is hate:
I am the politician, and I decide your fate.

I march before a martyred world, an army for the fight;
I speak of great heroic days, of victory and might;
I hold a banner drenched in blood, I urge you to be brave;
I lead you to your destiny, I lead you to your grave;
Your bones will build my palaces, your eyes will stud my crown;
For I am Mars, the god of war, and I will bring you down.¹³

¹³ This is a track from the CD *Orgasmatron* of 1986.

John Lennon (1940-1980)

gimme some truth

i'm sick and tired of hearing things
from uptight-short-sighted narrow minded hypocrites
 all i want is the truth
 just gimme some truth

i've had enough of reading things
by neurotic-psychotic pig headed politicians
 all i want is the truth
 just gimme some truth

no short haired yellow-bellied son of tricky dicky
 is gonna mother hubbard soft soap me
 with just a pocketful of hope
 money for dope
 money for rope
 i'm sick to death of seeing things
 from tight-lipped condescending-mommies
 little chauvinists
 all i want is the truth
 just gimme some truth

i've had enough of watching scenes
of schizophrenic ego-centric-paranoic-prima-donnas
 all i want is the truth
 just gimme some truth

Governed by Lies

Book 1

Inside a ministry

Chapter 1.

Introduction and preview.

Table of contents of this chapter.

1. The genesis of this report.
2. Goals and methodological remarks.
3. Preview of the chapters 2-9.

1. The genesis of this report.

This is the report of a study of the operation of governments and the functioning of people in organizations. It is the result of an effort to understand and explain them. At the same time it is the report of a series of unexpected discoveries.

In a certain sense the study started with questions which arose while listening to daily news broadcasts and reading history books.¹ These often gave a feeling of incomprehensibility and inexplicableness. Explanations were either absent or unsatisfactory. History books and books about specific events describe (selectively). They rarely if ever analyze openly,² or try to explain.³ They don't try to draw conclusions. Maybe there were methodological problems. Anyway, for a long time the present author did not know how to go about finding answers.

The mystery was an important reason for accepting a job at the Dutch ministry of education in 1985.⁴ In the course of time the job provided valuable direct observational information. But for twenty years important questions remained unanswered. An encompassing framework for explanation remained elusive.

The crucial opening came in the second half of 2005, when the author was asked to replace a colleague in a project intended to provide the education directories of the ministry with a new and better computer based information system. The colleague was moving to another department. Already by the end of the year it had become clear that very much was very wrong with this project. From that moment on, the author tried to play two mutually supporting roles: that of representative of his directory (= of his most direct colleagues), and that of a researcher trying to get as clear a picture of the phenomena as possible. Trying to understand them, and where this seemed impossible, to find additional information.

In June 2007 the efforts at improvement of the project had not produced any results. There even seemed to be a serious risk of worsening. According to the present author the worst thing about the project was the systematic deceitful behavior of the people building the system towards his colleagues and himself. In his opinion their behavior was simply unacceptable. It was in flagrant contradiction with the code of conduct of the ministry. He saw this contradiction as a good reason to appeal to the secretary general. An appeal would have the additional benefit of showing what the secretary general would do.

To inform the secretary general he wrote a history of the project until that moment. This was the first version of the first half of chapter 2. It was the beginning of this report. A history of the project

¹ Two memorable early ones were J.H. Breasted, *A History of Egypt*, and W. L. Shirer, *The Rise and Fall of the Third Reich. A History of Nazi Germany*.

² Analyze openly means among other things: honestly and clearly, independent of those who have an interest in what is written. For example, “less than frank” is vague and ambiguous. It covers all shades between white and black, and may be hardly objectionable. Using “less than frank” as a euphemism for “telling lies” is misleading and collaborative politics, not science. According to Merriam-Webster 2002: **Lie vb lied; lying [...] 1: to make an untrue statement with intent to deceive 2: to create a false or misleading impression ~ vt: to bring about by telling lies <i>**lied**</i> his way out of trouble>**

³ In a responsible way that is, to be distinguished from uncritical, dogmatic or authoritarian assertions. Where uncritical means: without appropriate reflection, asking oneself questions like: can this really be true, does it explain everything we see, are there counterexamples, does it explain other, similar phenomena as well?

⁴ “Ministry of education” is used as shorthand for: “Ministry of education, culture and science”. Where science is to be understood in the broad sense, including for example economics, law, and philosophy.

might serve another purpose as well. It was hoped that a chronicle of the events would show more than individual events, and help getting a better understanding. In the end it failed to elicit improvements in the project. But it greatly helped understanding. In the first place by showing the structural character of the misconduct.

From a logical point of view, and considering the character of the various forms of misconduct visible in the project, the misconduct could not be exceptional. But even the most logical reasonings can better be checked. For that reason several other projects and activities were studied as well. This gave rise to the chapters 3-5.

The chapters 2-5 describe the reality of what can be considered as some arbitrarily selected projects in government and its agencies.⁵ It is obvious that the observed misconduct is incompatible with adequate supervision of government. How can this be? Why don't we hear about the misconduct from the Dutch General Accounting Office (DGAO)? Why the need of whistleblowers? To shed some light on questions like these, chapter 3 considers the way in which the DGAO evaluated the effectiveness of its reports about the management of ICT-projects⁶.

The observed phenomena are incompatible with all known codes of conduct, and with the assertions of ministers about the integrity of the government. The Dutch government has created an Office especially for the purpose of promoting integrity in government. Some of the activities of this Office are studied. It is found that both Offices, DGAO and this integrity office, do as if there is no serious problem at all.

The chapters 2-5 about the cases in the education ministry are followed by an analysis (chapter 6). This analysis was made at a time when the official reports about the financial crisis were still unpublished. The author's plan was to first analyze and formulate (hypothetical) conclusions on the basis of the preceding chapters alone, and then to study a number of other cases. The new cases could be used to check the conclusions of the analysis of the earlier chapters. The reasons for presenting an analysis immediately following the chapters 2-5 are:

1. It is an analysis of these chapters only;
2. It was actually made immediately following the completion of the first drafts of these chapters;
3. It shows the reader that, and how much, can already be inferred from a few cases.

To have significant added value, and to be useful as a check on hypotheses, the chapters 7 and 8 should overlap at most a little.

Chapter 9 provides complementary analyses, conclusions and measures. The analysis of chapter 6 has been kept separate because it concerns little more than the preceding chapters about the *internal* operation of organizations. Chapter 6 does not refer to the chapters 7 and 8. The analysis of chapter 6 has significantly influenced the work on the chapters 7 and 8, but not vice versa.

The chapters 2-5 show the internal operation of government, including the functioning of top managers. The influence of the political top remains implicit.⁷ This can be seen as a notable fact in itself. It makes one curious as to what political administrators do, and how they work.

In September 2008 the financial system collapsed worldwide. In the following years and in many countries, governments or parliaments installed inquiry commissions, ostensibly to find the causes. By the end of 2010 the author happened to see the report of the hearings which had been held by the Dutch inquiry commission. The commission had questioned everyone who had been head of an organization with a role in the Dutch financial system, and some selected experts. (It questioned almost no one else). The commission asked these people questions about their functioning in the years before the crisis.⁸ The hearings report therefore looked like a perfect complement to the chapters 2-5.

⁵ Arbitrarily selected relative to the reader. Assuming the position of the author to be randomly selected. The projects were all projects he could see sufficiently clearly.

⁶ ICT= information and communication technology.

⁷ With the exception of minister Hermans in the renewal project of IAG. See Chapter 5.

⁸ For simplicity the introduction uses the singular "crisis" instead of the plural "crises", and ignores the debt crisis. Actually there were two crises: the subprime crisis and the crisis of the government debts. Although they have similar causes (irresponsible, dysfunctional governments), they are very different in character. The debt

As further study showed, this was indeed the case.

It turned out that US Congress had installed a similar commission, the FCIC⁹. This commission too had held hearings. It had published the transcripts. Both commissions also published very informative reports with descriptions and (hypothetical) explanations of the crucial events.

In order to properly evaluate the hearings it is necessary to know the history of the crisis and to understand the essential processes and events. Thanks to the reports of the commissions and the internet, most of the necessary information can be found easily.¹⁰ Fortunately the relevant processes and events are less complicated and far less difficult to understand than many of the heads suggested. As a consequence it is rather easy to explain the crisis, to find its causes, and to formulate measures which may be expected to prevent repetition. It turned out that many (kinds of) failings contributed to the disastrous course of financial history, and that many of them have a rather general significance. This explains why the chapter about the financial crisis is longer than the chapters 2-5 taken together. One of the conclusions is, that the findings of this chapter are compatible with, and help explain, those of the chapters 2-5. The chapters 2-5 very much help to understand the causes of the financial crisis, but they do not (and cannot) explain the crisis.

One of the aims of this report is to bring related phenomena together in a single (explanatory) framework. The report wants to explain what the cases show, assume and imply. It tries to find out whether the cases agree or differ as to what they show, assume and imply. It wants to find out whether the common denominator helps explain these and other cases and phenomena, or is incompatible with one or more of them. At the same time, having written the chapters 2-7, the question arose of checking compatibility of the conclusions with other cases. In addition there were cases which seemed to deserve serious study in their own right. Such as some well-known whistleblower cases. The more so since without an appropriate study one cannot know whether cases hide something new and unexpected. These were the reasons for studying the set of cases of chapter 8. Of course, after the chapters 2-7 and as long as no contradiction is found, their treatment can be less extensive; and priority can be given to discovering the similarities and differences, and to aspects which are peculiar to a specific case.

The main conclusion is that the fundamental aspects of the phenomena observed in the chapters 2-7 are all-pervasive. It must be inferred that they dominate the development of society. They guarantee the worst possible disasters.

The conclusions of the chapters 2-8 were unexpected and far reaching. Still, to infer them required no more than easily accessible public sources. It was more a matter of adding one to one than something difficult.¹¹ The same conclusions could have been drawn from numerous other cases, including the run up to the second world war.¹² The question therefore arises: why didn't numerous other people, especially historians, draw these or similar conclusions? Why aren't they common knowledge? These and similar questions are addressed in the chapters 6 and 9. They give at least partial answers. They go a long way towards explanation.

As part of the search for answers, the author reread some of his old history books. That is to say: he reread them with the above questions in mind. The first book chosen was *The Proud Tower* by Barbara Tuchman.¹³ Apart from being useful in the search for an answer to the question about the failure to

crisis is very simple to understand and explain, and therefore needs only little space in this report. To avoid misunderstanding it is noted that the relative amount of space is not meant to express a value judgment: the debt crisis may be just as important as the subprime crisis, or even more important.

⁹ FCIC= Financial Crisis Inquiry Commission.

¹⁰ An important exception is the legal framework, especially applicable liability law. Another is the duties and authority of supervisors. The practical meaning of formal (legal) descriptions may be puzzling, especially as compared with claims of supervisors in their (annual) reports, and as compared with the duties and authority of other supervisors.

¹¹ The point being that the addition has to be made.

¹² This follows from analysis of Shirer's *The collapse of the third republic*, and some of its sources, or similar works.

¹³ About the years before World War 1 in various European countries and the USA.

learn lessons,¹⁴ *The Proud Tower* proved useful in another way too. Namely as a reminder of the Dreyfus Affair. The Dreyfus affair was socially traumatizing France around 1900. Closer study of the affair (= case) revealed important similarities with cases studied earlier. Since it seemed very valuable to extend the historical basis of the study, the Dreyfus case was studied in some detail. The findings were added to chapter 8. Comparison with one of the most important Dutch whistleblower cases shows that in the 20th century important social and political customs have remained the same, or became worse. And whatever improved had no significant effect on the main evils.

So the drafts of the chapters 2-9 were written in the order presented. And without the policy portal project of chapter 2, the study would not have been made, and the report would not have been written.

2. Goals and methodological remarks.

Ultimately this report has a practical end. It wants to prevent innocent people from being harmed by avoidable behavior of other people which they never approved of. The other goals are subordinate to this ultimate goal. They are means to help realize this end.

The methodological sections account for some peculiarities of this report.

The report wants to inform.

As noted above, this report was written to support the efforts to stop the revolting and mystifying phenomena observed in the policy portal project. As time went by, and the efforts at correction were systematically obstructed by the management, a report about the reality shown in this project and in many other cases seemed useful if not necessary as information of the public. The author had never seen a publication showing anything similar.¹⁵ Scientific publications not excepted. Scientific publications don't even notice a possibly important hiatus in the knowledge of reality. They manifest a complete absence of interest in the internal operation of public administration. This fact alone suffices to explain the absence of understanding in the sciences. A clear indicator of the state of affairs in the sciences is the fact that Weber (1864-1920) is still presented as being relevant.¹⁶ While Weber never saw the inside of government bureaucracies of his own time, let alone those of the years after 2000, which are about 100 times bigger.

There should be publications showing voters how a ministry really works,¹⁷ and to warn them against illusions and misleading tattle and lies. The publications should elicit and support a discussion aimed at correction. Now as in the beginning of the inquiry, the author thinks that knowledge of the reality of government and politicians is a requisite for being able to vote responsibly. It is a requisite for the correction of government, and possibly even for the survival of mankind.

Reality does not agree with what most people imagine or what they consider necessary or desirable. Publications and the media betray no understanding.¹⁸ This lack of knowledge and understanding motivates the emphasis on descriptions of empirical reality in this report. The descriptions are little more than selections and summaries of documents in the archive, and the reader is urgently recommended to check everything for him or herself.

Against the background of the contents of education and what one sees in the media, the facts are surprising. Without study and reflection it may be hard to accept that they are not incidental but structural. And that no effective supervision and correction take place. The analyses are meant to find explanations, and to find measures to eliminate the causes.

¹⁴ The book is not interested in learning lessons. As a consequence, much of the information needed to draw conclusions and learn lessons is missing. History writing requires selection, and selection requires criteria.

¹⁵ The books of Van Buitenen's were studied as part of the inquiry. Although they give much helpful information about the internal operation of the European Union bureaucracy it is difficult to call them similar to the present report. Nijeboer's book about whistleblower Spijkers gives much helpful information about the misconduct of the defense ministry, but does not show (or discuss) its internal operation.

¹⁶ In the index of Braud *Sociologie politique* (2008) only Pierre Bourdieu is referred to more often. Weber is referred to twice as often as the next author. To mention just one example.

¹⁷ To be distinguished from theoretical-idealistic: how they should work or are supposed to.

¹⁸ Van Buitenen and Nijeboer are no exceptions.

The report wants to warn.

The expanded study showed much more than the cases in the education ministry, and much more than expected. Both quantitatively and qualitatively. Information may remain the most important goal of the report. But much more than thought initially, the report is also meant as a warning. It shows that the cases cannot be interpreted as incidents. They can only be understood as manifestations of structural, harmful and dangerous defects in present social and political systems. The report and its analyses can help protect against the eternal tattle of politicians and their clients. Against the kind of tattle seen in all of the cases. The report and its analyses show that it is indeed no more than tattle, meant to mislead, of incompetent and unreliable people. The report and its analyses show that the combination of (ab)use of power with slippery tattle makes them very dangerous. The report shows that far-reaching measures are absolutely necessary to avoid greater catastrophes than mankind has ever seen. It shows the causes of the status quo and of its stability. The causes explain the status quo and the absence of improvement. They also explain why certain (half-) measures are equivalent to doing nothing or worse, and to letting dangerous people continue making the world ever more dangerous.

The report wants to show how to make an inquiry like the one underlying this report.

In addition, the content and structure of this report have a methodological-didactic goal. The report tries to show the power of the method of “search, reflect, combine and analyze”. It shows that and how readily available information can be analyzed to show, or rather imply, very much more than one sees on the surface. “On the surface” (“superficially”) meaning: without appropriate reflection and comparison. Numerous (“sub”)methods used to find or induce explanatory information or hypotheses are implicit in the analyses.

The report would like to show how one can find and infer useful or necessary information, meaningful knowledge, or understanding, implied by (“concealed in”) available information. So that more people can do this kind of analysis, and, among other things, correct and improve this report, and contribute to the realization of its aims.

The set of cases provides plenty of opportunities to compare people, phenomena, etcetera, with one another, to check for similarities, differences, consistency or contradictions. The report (together with its appendices and archive) includes more than enough material to check its reliability.

The role of the archive and appendices. The report as a guide to the archive.

The report is intended to be checkable and reproducible. It wants to show how the reader can find his way independently. It wants to enable the reader to reproduce it, or, preferably, improve it. For this reason the report and the archive on which it is based should be seen as an indissoluble whole. The report should be seen as “summary and conclusions” of, and guide to, the archive. The report does not replace the archive.¹⁹

The appendices form an intermediate stage between the archive and the report. Especially the chapter about the financial crisis began with what have become appendices. Most of the appendices began as preliminary studies. Some of them have been changed in the course of the writing of the chronicle or analysis, for example when something required clarification. The appendices may also contain material (tell-tale quotes and analytical remarks) which was found in efforts to check hypotheses. They form an archive with a higher concentration of relevant information, and more easily accessible than the underlying documents. For example if one wants to check something, or get the flavor of a publication or series of publications, hearing(s) or whatever.

In principle, chronicle and analysis are kept separate; but they are not independent.

Where feasible, the observations are presented in the form of chronicles. From the very beginning

¹⁹ No history can replace its sources. Even less when the selection has not been specified and accounted for.

the chronicles were meant to orderly present the most important facts. The facts being selected so as to be as self-explanatory as possible.

Facts are facts, and differ in nature from analyses. For that reason the facts have been kept separate from the analyses.²⁰ This also helps to keep the history as accessible as possible during further work, and to avoid mixing up facts and analysis as much as possible.

The analyses try to explain what the descriptions do not, or insufficiently. They may also note gaps in the chronicle: things that did not happen but should have happened. This is rather crucial. Much misleading is accomplished by leaving unmentioned that duties required actions or a different actions. In particular by not noting inaction where action was required to prevent immeasurable harm.

The analyses reflect on what the description shows, on what it assumes and what it implies. They make comparisons with similar or seemingly incompatible phenomena. The results are presented in the form of summaries and conclusions. As regards the conclusions: it has been tried to find and formulate conclusions which enable one to present a set of measures of which it is clear that they are necessary and sufficient to prevent the undesired phenomena listed in the chronicle.

When one analyses and tries to explain phenomena described in a chronicle, one may notice both redundant information and gaps (with respect to the analysis, summaries and conclusions that is). This suggests an iterative approach, wherein the chronicle is more or less adapted to the analysis, and, of course, the analysis to the chronicle. In other words: the facts presented in the chronicle are selected on the basis of their importance for peoples lives and all kinds of developments which affect peoples lives, and on the basis of the needs of explanation, conclusions and measures. Taken together, chronicle and analysis should explain the chronicle (the observed facts), and show the reader that denial of the conclusions is incompatible with the facts or makes them unexplainable, and that non-implementation of measures will keep matters as they are.²¹

Keeping the chronicle separate makes it relatively easy to test intermediate results in the course of the analysis and the iterative process. Apparent contradictions have to be explained or solved. Of course, the final explanation should be free of contradictions.

Separation of chronicle and analysis is feasible or relatively easy when a case is defined by unambiguously identifiable processes, and these processes have run their course. It can be different when a process has not been completed. Then responsible selection is more difficult, or impossible. Chapter 2 is devoted to a project wherein the author participated. It was written in the course of the project, as a parallel activity. Additional events and information required reflection and possibly action. This is how in chapter 2 process (history) and analysis got interwoven. It did not seem useful or necessary to disentangle them.

Most of the other analyses are explicit efforts to understand and explain, and to find out what has to be done to set matters straight.

The (sub)sections “Summary and conclusions”.

All chapters and several sections are provided with a (sub)section titled “Summary and conclusions”. These (sub)sections are meant to present the important results; to provide easily accessible overviews; to stimulate reflection about the observations and analyses; and to distinguish more and less important aspects. They represent an essential, though not necessarily final, stage in the analysis.

They are placed at the beginning of chapters and sections, and not at the end. This is done for convenience, to make them easier to find when using a table of contents. It is not done because they

²⁰ To a certain extent, description is impossible without analysis. In order to keep the length of a description within bounds, a writer has to decide what to include and what to leave out. In the case of this study the ultimate goal is prevention, to be accomplished via understanding and explanation. The descriptions should be sufficient as a basis for understanding and explanation, and possibly, for the refutation of incompatible alternative “explanations”. It need not contain information that does not serve these goals.

²¹ Note that “explainable” is supposed to mean explainable in a deductive sense. Explainable therefore is a form of consistency. There should be no inconsistency between various pieces of information. (Assuming information to mean reliable information). Trying to understand is trying to deduce; and if understanding proves possible one has also shown consistency.

have to be read before reading the text which they summarize. Rather the contrary: they can better be skipped at first reading. They are at least one analytical step removed from the observations. Reading them before reading the analysis on which they are based may introduce bias. They may moreover be hard to understand without having read the main text.

Note about the country of origin and relevance of the cases.

Everyone is born somewhere, and the author was born in the Netherlands. It was in the Netherlands that he spent most of his life. From 1985 to 2011 he worked at the (Dutch) ministry of education. Combined with a desire to understand the operation of government, it were his experiences with a project in this ministry from 2005-2010 that gave rise to the inquiry which resulted in this report. Already in the course of the project, the inquiry was expanded to other processes about which the author had sufficient information.

Analysis of the observations led to the conclusion that the observed misconduct and failure are structural, and have causes of a general nature. That is: they are not due to specific characteristics of the activity or organization which shows the misconduct and failure. They can be observed almost everywhere. They are not caused by “human error” or unavoidable circumstances, but consciously, by man made, avoidable conditions, such as laws, procedures, and ways of selecting people. It followed that similar phenomena should be visible elsewhere. Although there is good reason to expect them to be hidden as good as possible by those responsible, as in the ministry of education. This is why as a rule cases only get known if they are impossible to keep hidden, either by the size of the damage caused externally, or because someone blows a whistle (or both).

To test the hypothesis about the general nature of the causes, a number of cases outside the ministry and the Netherlands were studied. Mainly because the author was best informed about Dutch cases, these form the majority of the test- or comparison- cases. However, cases concerning the European Union, the United Nations, and even a (French) case of around the year 1900 could also be studied. They show nothing substantially different.

From the point of view of this inquiry, the subprime crisis came as if sent for. Especially because it heavily involves the USA. An equally important reason being that it enables evaluation of the persons in the highest responsible positions, and to see how they account for their behavior. The crisis supports the hypothetical conclusions drawn from the Dutch cases, and provides important additional insight. Analysis shows that as regards the deeper causes, there is no significant difference between the USA and the Netherlands, or other countries for that matter.

Summarizing: By their nature the causes found are general. They are independent of specific characteristics of the case or the organization or country of origin. In number, most cases are from the Netherlands. In size and weight, the case-studies mostly concern the Netherlands and the USA approximately equally. Still, cases from other countries and international organizations are also studied, and important. Everything seen in the cases, in history, and in the present, supports the hypothesis of the general nature of the causes discovered.

The norms and values used in the evaluations.

The present report tries to distinguish facts and evaluations as much as feasible. By definition, evaluations include judgments.²² Judgments are made with the help of a set of norms and values. In the present report, “a set norms and values” indicates the measuring stick for judgments, including judgments made in evaluations.²³ The following introduces, outlines, and accounts for the set of norms and values used in the present report.

²² Merriam-Webster 2002: «evaluate [...] 1: to determine or fix the value of 2: to determine the significance, worth, or condition of usu. by careful appraisal and study»

²³ For consistency (required at least for communicative purposes) a set of norms and values has to be consistent. It should distinguish violable and inviolable norms and values. The violable norms and values should be provided with relative weights. Enabling consistent application. Without weights, a given situation may allow for different decisions. This note is meant to indicate that the present text is incomplete. It presumes acquaintance with the principal parts of the publications mentioned later in this subsection.

An action or omission may be in agreement with one or more specific norms. It may serve one or more values. It may do so to a greater or lesser extent. It may comply with certain norms or values, while falling short of others. It may violate one or more of them. A lie violates the norm of truthfulness. Dumping waste in the environment harms, and/or creates risks for, the welfare of people, and for life in general. Welfare is a value. Values such as welfare may be used as a norm.²⁴ A set of norms and values determines in what respects something is good or bad, laudable or objectionable, and to what extent it is good or bad. Deceit undermines communication and cooperation. In other words: deceit is incompatible with the value of cooperation. Even if deceit is not intentional, it still means a lack of reliability, and reduces the score on the norm of reliability.

As far as known, objective norms or values do not exist. No norm or value has ever been proven to be objective in the sense of being independent of any human opinion. Norms and values therefore must be assumed to be subjective. A matter of opinion. This means that at least in principle, everyone is free to accept or reject any norm or value. This freedom is two-sided however. A person may be free to do what he or she likes. But everyone else enjoys, or can claim, the same freedom. People may react the way they like upon the use a given person makes of his or her freedom. For this reason, restraint is a wise and safe strategy.

In fact, as soon as one wants something of somebody, and doesn't want to use force or threaten with the use of force, then one has to respect certain norms and values. One of the most basic things people want of one another is communication. This means that one has to reach agreement about the meaning of signs. This turns out to be equivalent with acceptance of a small but important set of norms and values. Which includes a (possibly minimal) dictionary, some grammar, and the promise to mean what one says or writes. Henceforth this set is called the basic set. Specifics depend on the nature of the communication. Apart from the definition of the signs, the set of norms and values required for communication is limited and conceptually simple.²⁵ To put it in a nutshell: communication requires truthfulness and reliability.

Communication can only be called meaningful if the people who communicate mean what they say. Without that, utterances are undefined and without a reliable meaning. Hence in this report, communication is always supposed to mean meaningful communication. Meaningful communication is necessarily voluntary. If communication is not voluntary, there is no binding reason for compliance with the basic set of norms and values. Without for example truthfulness, communication is, or rather: utterances are, meaningless or worse: misleading.

In the absence of proof of the opposite, it must be assumed that people are free to communicate with a given person, or to forgo communication. In general, people will be willing to communicate with a given person only under certain conditions. Which means that voluntary communication may require acceptance of more norms and values than those of the basic set. That is: the promise to comply with a given dictionary and grammar.

The basic set premises a form of mutual respect. The reason being that voluntary communication implicitly recognizes the right to abstain from communication. In other words: voluntary communication assumes a right to choose. Which is a form of respect.

The most important elements of the above can be summarized as follows. One is free to communicate or not. One may set additional conditions for the willingness to communicate. But once one has chosen to communicate, one is obliged to accept the set of norms and values which is necessary for communication to be meaningful. In other words: there is no proof of the existence of any objective ("naturally binding") norms or values. But a communicative society by definition has a basic set of norms and values; applicability of the adjective "communicative" requiring compliance with this set.

The set may be simple, but its implications are far reaching. The set implies much more than one might possibly think. For example, meaningful communication requires consistency, honesty and reliability. A speaker or writer should mean what he or she says or writes.²⁶ He/she should not lie, and

²⁴ This is why norms and values can best be kept together and treated as a whole, as a set.

²⁵ It is limited in this sense, that it is necessary and sufficient for communication, but not suitable to evaluate everything. Such as food or music, or brands of phones. It is necessary to evaluate a constitution, but not sufficient to evaluate every stipulation in a constitution.

²⁶ In many circumstances, public officers should moreover say and/or write what they mean.

should therefore (!) keep promises. A speaker or writer should not contradict him- or herself knowingly, because contradictory statements cannot all be true.

The fundamental concept of “respect” is subjective. Everyone is free to decide for him- or herself whether he or she is or feels respected. It is therefore not the actor who can decide whether another person is respected (sufficiently), but only the person who wants to be respected. Unless a speaker is assumed to be honest, it is useless, misleading and/or harmful to listen to him or her. Last but not least, respecting a person may require care for that person’s welfare, and may require safeguarding that person from the undesired consequences of one’s avoidable activities and/or omissions.²⁷

Integrity can be seen as a condition for respect and reliability. For the purposes of the present report, the concept of integrity is specified in section 4.3. It is specified by a list of conditions. The conditions are meant to be satisfied by an accountable representative. Such as a public official. The list begins with: truthfulness, openness, self-knowledge (including knowledge of limitations of abilities), consistency, and absence of false pretensions. All of them are derived from, or forms of, respect and reliability. They express generally, publicly, accepted norms and values.

It will be clear that respect and reliability require a lot. Respect and reliability require for example that one only accepts a job which one can fulfill without causing harm or risk for anyone. One should be able to account openly about the fulfillment of the job. Not only about successes, but also about mistakes and failures. Respect and reliability forbid the assumption of tacit agreement with the given regulation of the state. And so on.

The set of norms and values necessary for communication includes those “universal” human rights which do not infringe upon the right to be respected or safeguarded. The set does not include obligations other than the obligation to communicate reliably. It does not admit unequal treatment of people in a communicative society. Unequal treatment being incompatible with (equal) respect.²⁸ The set includes only those norms and values which are necessary for meaningful communication, and which can be accepted voluntarily. The fundamental reasons being 1) that there are no objective norms or values, rights or obligations whatsoever; 2) that meaningful communication requires acceptance of some basic norms: especially respect, safeguarding and reliability; and 3) that- consequently- all other norms and values, rights or obligations are binding only when voluntarily accepted. Acceptance by a (political) majority, or the threat or use of force, do not make norms or laws logically or ethically legitimate or binding.

The norms and values associated with communication may seem natural or self-evident. In the following sense they are. Communication is the basis of every human society. The fact that meaningful communication requires acceptance of a specific set of norms and values, explains that these norms and values are shared by almost all peoples and religions. Irrespective of their specific language and customs. At the same time however, the set is not compatible with the present laws of any country. In terms of the norms and values of communication, present laws respect the people in power much more than everyone else. Even if the law would require those in power to communicate reliably and respectfully with the powerless (it doesn’t), it certainly allows those in power to violate these norms and values with impunity. Moreover, as a matter of principle, it is noted that there are no known grounds for assuming the present laws to be logically or ethically binding. This report does not make that assumption either. Instead, laws and their makers are part of the subject matter of the report. They are going to be evaluated.

People who want to communicate should accept the norms and values which are premised and required by communication. But what if they don’t? What if they only pretend to communicate, but do not really respect the people they speak to? If they withhold important information, lie, or use other tricks to make people believe what they themselves do not believe? In this connection it is essential to repeat that there is no ground for assuming the existence of objective norms and values which bind everyone or anyone. One is under no obligation to communicate and accept the norms and values of

²⁷ Again: undesired according to the person possibly being affected by consequences.

²⁸ Respect meaning complete respect. Equality is therefore implied.

communication. (Of course, people should only be admitted to public positions if they accept these obligations). But if one doesn't accept this obligation, other people have no obligations either. The other people are free to give rights (that is: to create obligations for themselves), or withhold them. Someone who does not want to communicate in accordance with the appropriate norms and values has no grounds for claiming any rights or obligations from anyone. A communicative society is free to do with non-communicants or violators as it deems fit. Of course, using this freedom may have consequences. To minimize harm, it is wise to use this freedom with restraint.

To summarize this section in a simple fashion, it can be said that the present report tries to establish to what extent conduct, activities, etcetera seen in the various cases comply with the norms of respect and reliability. The report assumes no rights and obligations other than those required for voluntarily and meaningful communication. As regards human conduct, it only accepts explanations which are compatible with the norms of respect and reliability. Neither constitutions, treaties, laws, nor political theories are assigned normative significance. Their legitimacy and quality are to be proven. As will be amply shown in the following chapters, none of them can pass the muster of the norms of respect and reliability.

For more explanation and elaboration of the norms and values related to communication, the reader is referred to the book *Het recht van de logica* (*The law of logic*, in Dutch²⁹) and the paper *Communication and norms*. The paper can be found on the internet.

Why the writing of history should begin as soon as possible.

If history is to be reliable and useful, the contemporary information required for the writing of history should be collected as soon as possible. It bears no delay. The reason being that those in power want people to have a positive image of their persons and performance. Both during their lifetime and in history. For that reason they have an interest in hiding a lack of integrity and/or competence. They don't want to leave traces proving misconduct or failure. They have an interest in selectively hiding or destroying evidence. They have the power to do so. And they actually use that power.³⁰

It is an empirical fact, observable every day in the news, that people in power, and people aspiring to positions of power, do all they can to create a positive image of themselves. It is untrue that they are open, and encourage open discussion.³¹ They are not interested in all relevant information, arguments and the full truth. They are only interested in information which supports their preoccupied viewpoints. They abuse their power to select information and manipulate discussions. They do not refute counterarguments. They ignore, deny or downplay them. Open discussion requires a questioning and listening attitude. Instead, they almost always assume a defensive and repressive attitude. They defend their own proposals. They ignore alternatives, or try to show that they are bad, useless, impossible, etcetera. They defend whatever they did or did not. They try to make believe that they did and do whatever was possible and needed. They try to make believe that they make and made no errors. They do not tolerate true opposition, even when they say they do.³²

These remarks are supported by an overwhelming amount of evidence from all ages. Including the evidence contained in the present report. It clearly shows that writing reliable history is no easy task.

It is interested politicians who decide if minutes are to be made of internal meetings, who can modify and have to approve them, and make the rules for archiving. It is these people who determine the length of time documents are kept in archives, and when they are to be destroyed.

They abuse their position and power to influence the media and public opinion. The media have allowed themselves to be maneuvered in a dependent position. A position in which compliance with their own codes of conduct is suicidal.³³

²⁹ I am sorry for that, but the book contains substantial specifically Dutch sections. These require more than translation to become understandable and useful for people outside the Netherlands.

³⁰ See the case Spijkers, sections 4.7 and 8.3, and the reports of various inquiry commissions. Such as those of the subprime crisis.

³¹ Think of interviews!

³² Corollary: they are not leaders at all.

³³ Supposing they have (relevant) codes of conduct.

This is corroborated by all relevant contemporary evidence, and by the absence of contrary evidence. Not only by the media, but also by history books. The fact that many heads of state, from Alexander “the great” to Mao, are still held in high regard by very many people, is incompatible with truthful history writing and social education. Quite generally, history books tend to continue the propaganda of the governments whose activities they describe. There are exceptions, as when a thoroughly vanquished criminal ruler is condemned by the victors. Hitler is the main example. (There are not many examples). This exception cannot be seen as a sign of integrity of politicians and historiographers however. The point being that the condemnation of Hitler, the trials of Nuremberg, and the excessive attention to the war itself, greatly help obscuring the responsibility of the allies for the war. Many of them could and should have prevented it. Few people understand that Hitler could only wreck havoc because the governments of the other main western states did not do their duty.³⁴ If they had done their duty, there would have been no major war.

These remarks are consistent with the observation, that government organizations are kept hermetically closed, and that the information flow out of these organizations is strictly controlled by their political heads. It is obvious that rigorous control of information is only necessary if transparency and freedom of information would undermine efforts to create and uphold a positive image of politicians and governments.

Someone who really wants to understand political and related events, and the course of history, does not assume what has to be proven. Let alone assume what is known to be untrue. Such as the integrity of politicians. Someone who really wants to understand sociopolitical developments must try to obtain not only official publications, which are censored by definition,³⁵ but as much relevant evidence as possible. Because of archival rules, the possibility of accidents, “accidents”, and other causes of disappearance, he should do so as soon as possible. Only in this way can the possibilities for crucial information getting lost be minimized, and can one reasonably hope to get the information needed.

Prompt action is necessary but not sufficient. As the present report shows, the writing of reliable and useful history is not only hampered by insufficient information about the internal operation of government organizations. It is also hampered by a- possibly unconscious- subservience of journalists and historians to those in power, and by complacency and lack of integrity and competence. As shown for example by the general lack of interest in the internal operation of government organizations, and the tacit acceptance of their closed character. In theory, knowledge of the internal operation of government organizations might be irrelevant. But a priori the irrelevance is only a hypothesis. The truth or untruth of which can only be determined on the basis of relevant information. In fact, this report proves that such information and knowledge is necessary for the proper evaluation of the given political system. It is true that much can be learned and guessed without it.³⁶ But knowledge and understanding of the people involved (directly and indirectly), and of the structural character of the phenomena, are impossible without it. The state of mankind, and the fact that no fundamental improvement takes place, are the best proofs of this.

Maybe, theoretically, the collection of information and the writing of history need not go together. But if the writing of understandable and explanatory history is the goal of the information collection, then the collection can best be guided by questions arising in the process of writing. Specific questions arise especially when one tries to understand events. One should avoid collecting a terrible amount of similar information and missing the one crucial report. Which due to general biases and illusions can easily happen.³⁷ The passage of time need not help. “Distance” cannot fill gaps in information. Time

³⁴ Something similar applies to the financial crises of 2007-2013, and climate change. Neither would have taken place if governments had done their duty.

³⁵ By the definition of “official”. Don’t forget in this connection, that assertions such as that governments serve the country, or serve the population as a whole, are to be proven too, and not assumed beforehand.

³⁶ Logically speaking, and according to the present author, it is even sufficient. But no publication whatsoever betrays any understanding at all. Almost all media and historical publications show many kinds of illusions. (Some of which are discussed in chapter 9). So from a practical point of view, more information is necessary.

³⁷ The subprime crisis is a case in point. The reports of the US General Accounting Office (GAO), and to a lesser extent some of the reports of the Committee on the Global Financial System (CGFS) of the Bank for International Settlements (BIS), can easily be overlooked, being from relative outsiders, and for bad reasons only

can only bring better understanding and judgment if the relevant information is available and taken into account. If part of the information is unknown, time is apt to mislead. The observations made above show why misleading is more probable than objectivity or wisdom. It is certain that time elapsed after the events can only cause loss of information. Therefore the writing of history can best begin as soon as possible. Even if the process of writing history is understood to be never ending.

The above should be kept in mind when reading the following section. And the whole report, for that matter.

Falsifiable history requires true names.

Much of this report is devoted to descriptions of events. It is a kind of history. Nothing is fictional. The descriptions are no goal in themselves however. They serve as a basis for analyses which are aimed at improving understanding and explanation, and at finding measures which can prevent man-made disasters. The descriptions should therefore be as reliable and verifiable as possible. For that reason only well-documented cases have been studied. But not everything can be shown and proven with documents. And the descriptions should be open to public scrutiny anyway. The possibilities for checks, correction, and improvement should be maximized. This especially regards the people who figure in the events described. They should be enabled and encouraged to correct descriptions, and give their personal explanation and motivation. An important additional reason for inviting them to provide this information being that the present study does not result in understanding of the actors.³⁸

The report mentions many names, and all of them are true. No distinction is made between people of different hierarchical or political positions. It is assumed that a difference in position is no ground for discrimination. In some cases the names of several of the top officers are already known.³⁹ The chapters 7 and 8 concern widely publicized events. They are based on public information. The names of many of the top officers responsible for these events are well-known. The chapters 2-5 are of a somewhat different nature. They mainly concern the internal operation of a ministry. A few of the participants are known by name outside the ministry, but most of them are not.

From a logical point of view, a distinction on the basis of rank or another characteristic would be arbitrary. Replacing the names of participants lower in hierarchies by fictional names, or leaving them unmentioned, gives descriptions the character of fiction. It precludes correction and explanation by the people who are in the best or only position to provide them. As will be shown, understanding their conduct is of crucial importance for the prevention of misconduct. Fictionalization removes essential actors from the learning process. Since empirical studies of the internal operation of hierarchical organizations in general, and of government organizations in particular, are non-existent or extremely rare, and since the conduct of the actors seems to be the least explicable and most important phenomenon encountered in this report, it is of the utmost importance to get the relevant facts right.⁴⁰

Quite generally, knowledge can only be called reliable if it does not depend on specific characteristics of the observer or author. Therefore it should always be possible to check the sources. Which implies, among other things, that the persons who played a role in an event, or have direct knowledge about it, should be known by name. Prohibiting actors to comment, precludes correction of the description of the facts. It thereby precludes the improvement of the analyses and inferences which are based on them. It obstructs the acquisition of knowledge and understanding of the past, and the correction of public administration and political systems. As a consequence it blocks the search for effective means to prevent man-made disasters like financial crises, climate change and wars.

The report shows that voters do not know and understand the reality of the operation of government. It shows that it is of vital importance that they do. Without this knowledge voters cannot

touched upon by inquiry commissions (if at all). The adjective “relative” should be stressed: institutions like the GAO are principal agencies of the state.

³⁸ Apart from concluding that people differ far more, and more fundamentally, than commonly thought, and that differences in behavior can often better be ascribed to specific personal characteristics than “explained” by for example different circumstances and personal histories.

³⁹ Even of civil servants of lower rank. See for example Alexander Nijeboer *Een man tegen de staat (A man against the state)*, Papieren Tijger, Breda, 2006. See the chapters 4 and 8 of the present report.

⁴⁰ In fact, the misconduct is easily explained, but not in terms of defensible motives or norms.

know and understand what boundary conditions have to change, and how public administration can be enabled to do its job properly: for the public benefit. Without such knowledge and understanding voters cannot make responsible choices in public affairs.

It is furthermore highly desirable to end the dangerous custom of letting only top managers and heads of organizations (or their professional spokespeople) provide information about “their” organizations. It is dangerous because it goes entirely unchecked. It facilitates misleading and lies. It allows a hierarchical organization to operate as a dictatorship. It means acceptance of repression.

Even though some people may not like to be reminded of events in which they played a role, nothing is reported that is secret. Unless everything that is illegal and goes wrong in public administration is secret, and for that reason.⁴¹ Indeed, given the findings of the present work, the omnipresence of phenomena that cannot bear the light of day may very well be the one and only true reason for keeping organizations opaque. In any case, the secrecy cannot be justified by defensible interests of the people involved. Obviously, some of these people may not like the reported conduct to become public. But as the descriptions clearly show, they had a choice. They could have acted differently. Even though all of them are subordinates. They did not simply and only do what they were asked to do. They may have done what they thought was expected of them, or what they thought would further their career. But both before and during the described events they could have made other choices. They could have made a defensible choice. But they didn’t.⁴²

The people at the top are more or less public figures. They cannot be kept anonymous anyway. Their functions directly lead to their names. If “ordinary” employees are kept hidden behind a veil of anonymity, and if the top is left unmolested for reasons like the impossibility of knowing and controlling everything, then nobody is responsible in a way that is meaningful in any corrective and preventive sense. If secrecy would be meant to preclude their being held to account for the cases discussed, that would simply mean placing most of public administration outside the scope of any form of control. When public administration operates properly, there is no reason for secrecy.⁴³ It seems probable therefore, that those objecting to the use of true names do not do so to protect the people concerned or to defend a legitimate interest,^{44,45} but because true names must correspond to true reports, as fictional names suggest fiction. True names require reliability. Protection of employees is just a pretext. What those responsible want to suppress is not so much the names of employees, as the truth of what is happening. They want opacity because the internal operation of many of the organizations of public administration is indefensible. Public knowledge of what is really going on would require a very different kind of organization of public administration. It would mean the end of politics as we know it. This must be the ultimate reason for keeping organizations opaque. The present work clearly shows what this opaqueness leads to.

When public administration does not operate as it should, and represses internal efforts at correction, when supervision fails completely, and when this harms or endangers outside citizens, then every employee and citizen has a social obligation to inform his or her fellow citizens. This is the reason for writing and publishing the present report. It is published to contribute to more responsible public administration.

⁴¹ Much of what is shown in the chapters 2-5 is indeed illegal. At least in this sense, that the Dutch code of conduct and the general regulation for civil servants (“ARAR”) require civil servants to act as a good housefather should. Which many people obviously didn’t.

⁴² In the course of the events described, all actors mentioned have had plenty opportunities to give explanations. In the cases in which the present author participated he has always asked everyone why. He really wanted to understand. He did not get any sensible answer. Never. Most of the time problems were simply denied.

⁴³ Except for really exceptional cases.

⁴⁴ In the course of this report it will become obvious that secrecy is very harmful for public administration and society, and that it is incompatible with democracy. Reliable information about the performance of elected officials requires reliable information about the performance of the organizations of public administration for which the officials are responsible. Without this information, officials cannot be reliably evaluated.

⁴⁵ This would moreover mean an inconsequence of the law, since in general harm has to be proven (and to exceed the benefits of openness). The requirement would seem to be necessary to safeguard a meaningful freedom of publication.

Matters would be different if much was already known about the internal operation of hierarchical organizations. Or if the subject was given due attention by the media or the scientific disciplines concerned. Or if it had been given due attention in inquiries into the causes of the subprime crisis. Matters would be different too if the public prosecutor had investigated the criminal misconduct of employees of the ministry of defense with respect to whistleblower Spijkers. If parliaments had abandoned the fiction of the exclusive responsibility of the person “politically responsible” for these organizations. Or if they had treated such people as any other person having caused great harm. Or if the present work had shown that the internal operation of these organizations is of no importance in the cases where failings or misconduct of organizations played a vital role.

If there were open and reliable studies of the internal operation of the organizations of public administration, or if honest efforts were being made to correct these organizations,⁴⁶ then the need for verifiable case studies, complying with the customary scientific norms, would not be stressed so strongly. Regrettably there is no scientific monograph or textbook describing, analyzing and explaining the internal operation of hierarchical organizations as it really is. Including their operation in cases like those treated in the present report. The subject seems to be completely ignored by scientists, even though a majority of the working people in the present world works in hierarchical organizations, and even though it is obvious that the responsible operation of these organizations is of the utmost importance for these people and for the development and fate of human society.

In March 2018, an appeal to the Dutch Academy of Sciences to fill the gap remained unanswered. All of the many parliamentary commissions studied in the present report treated the organizations involved in failure or misconduct as an amorphous whole. They implicitly assumed organizations to be indistinguishable from its top. They ignored the distinction even when the organizations had hundreds or thousands of employees, and even when many employees must have been more knowledgeable (and honorable) than their management. In general, they seemed to be unaware of the employees outside the top.

The above is amplified by the observation that publication of the reports of the chapters 2-5 is essential for the understanding of people and events in general. It is moreover a matter of now or never. The net results of the processes described in these chapters may be inferred from the archives. Probably not.⁴⁷ Drawing the correct conclusions from official archives would at least require a very honorable and fearless, and very experienced researcher. He or she would certainly not be able to explain the net results. Most of the evidence necessary for explanation has never been archived, or only for a few years. While disinformation in the form of silences and lies abound.⁴⁸ More or less detailed descriptions are essential not only for understanding the net results, but also for understanding the conduct of the people involved. In particular the management by the top officers and the submissiveness of nearly all of their subordinates. The descriptions are essential to show the irrelevance of the code of conduct and the complete failure of any form of supervision. Either by a parliament or a specially instituted supervisor or inquiry commission. As explained later on, all of this is essential for understanding what governments do and fail to do. Leaving reports like these unpublished makes history unexplainable. It would leave a biased, far to rosy picture of those responsible uncorrected. It precludes properly informed participation in democratic processes.

The present report shows that most of the very great harm caused in the cases studied was due to the failure of people and organizations which are part of public administration. The harm was either due to their actions, such as irresponsible policies or laws, or to their omissions, such as failures in supervision, or to both. Sometimes they themselves cause harm, sometimes they are responsible for harm by having omitted to do their duty. In the more important cases the harm is immeasurable and irreparable. Indeed, the present work suggests, and for the financial crises proves, that the largest man made disasters were caused, or could and should have been prevented, by one or more governments or

⁴⁶ In fact, no efforts are made at all. The problem is not even recognized or identified.

⁴⁷ If only because they have been destroyed in accordance with applicable law.

⁴⁸ As shown in the chapters 2-5.

government organizations. The disasters include wars like World War 2.⁴⁹ If one wants to reduce the probability of man made disasters, then one has to find the causes of the failure of these organizations. It is simply illogical and irresponsible to exclude the internal operation of these organizations and the conduct of their employees from an inquiry into these causes.⁵⁰

In other words: the present work always uses the true names because:

1. It is meant to be truthful. It wants to avoid every suggestion of fiction;
2. Every person is treated equally;
3. There is a total or almost total lack of scientific, empirically based, knowledge of the internal operation of hierarchical organizations in public administration;
4. Important parts of public administration are found to dysfunction seriously, and their dysfunctioning caused and causes immeasurable harm;⁵¹
5. Lack of knowledge of the situation precludes correction;
6. Reliable knowledge requires verifiability (falsifiability), and therefore the names of the relevant actors;
7. As regards the cases studied, there is no defensible reason for secrecy. Neither is there reason for making exceptions;
8. Publication is a matter of now or never;
9. It facilitates correction and improvement of the case histories. Actors should comment on the reports and explain their conduct.⁵²

Publicizing supposedly appropriate or successful actions while concealing misconduct and failures facilitates or even promotes misconduct. Not only by preventing correction, but first of all by producing a biased, incorrect picture of the responsible officials, procedures and laws. In a democracy voters should be able to judge candidates and government officials as they really are. Voters should have unbiased and full information. People should be provided with the information which enables them to understand. Selectively incomplete and biased information is incorrect information. It results in erroneous (mistaken) choices. At present, voters do not have the information they need to get the people, laws, and policies they want.

As will be shown, the operation of government differs greatly from its words. In general the words are nice, inspiring confidence or at least indulgence, and belief in best intentions. For example, the headline of an interview in the Yearbook Integrity 2010 of the Dutch Office for the promotion of integrity in public administration, quotes Andrée van Es, the director-general responsible for integrity policy of government at the Dutch ministry of Internal affairs, as having said:

«Everything you do should be able to bear the light of day»

This is addressed to government employees.

Somewhat farther on in the interview she notes:

«Integrity requires transparency and openness».

This leaves nothing to be desired, and nothing to be added.

⁴⁹ And obviously the Great Chinese Famine (with 40 million deaths) and the so called Cultural Revolution. The Cultural Revolution was a kind of civil war initiated by Mao to regain lost power. It destroyed innumerable lives and a large part of the material Chinese cultural heritage. The name “Great Proletarian Cultural Revolution” was used to hide the true purpose.

⁵⁰ Because of its illogical nature, the assertion that there is no need to study the internal operation needs proof. The above shows that this proof is nonexistent. The present work shows that understanding the internal operation of hierarchical organizations is essential for the explanation of the cases mentioned.

⁵¹ And will cause, unless fundamentally corrected.

⁵² Their views and motivation may be important for the solution of the problems. “Enabling them” to comment would therefore be too weak a formulation.

The report does not claim perfection; it marks a phase in an ongoing endeavor.

Although much has been done to ensure reliability of this report, it has not been tried to make it perfect in any sense, except perhaps with regard to reliability. The main reasons for accepting imperfection being that perfection is beyond the reach of any being, and useless. “Perfection” is anyway subjective, undefined, and possibly indefinable. The suggestion of believing it to be realizable shows a lack of understanding of the relativity of all human work and understanding, and of language. The idea that a report can give final answers or solutions is a chimera and a false pretension. If only because it is far from certain that even all practically important implications of the presented observations and analyses have been seen. Implications may be logically deductible, and nothing “really” new. This does not mean however that anyone sees them, or even the most important ones. Indeed, a large majority of people sees at best only a few of the implications of what everyone knows or can see.

Moreover, in the eyes of the present author, literary goals and requirements of conformity to what is customary, harm the more important goals, and easily hamper or inhibit thinking effectively and efficiently. An important example is the rejection of enumerations and the point-wise listing of items. Let alone the requirement to force all information into running text.

The relinquishment of the idea of perfection is related to the idea that this report is part of an ongoing collective endeavor, and to the wish of the author to be or make himself superfluous. Which is not to say that the report only wants to be helpful: it definitely tries to give reliable answers and solutions to questions and problems which it finds in urgent need of answer and solution. But at the same time it does not pretend infallibility, and is not intended as the last word on the subjects it discusses.

The report aims at overkill.

If one doesn’t know what is and what isn’t relevant for a convincing explanation of historical events or developments, one can only try to be as complete as possible. At least as regards everything that is not self-evident, generally known, or obviously irrelevant for understanding. This is the reason for the length of the original (Dutch) descriptions of the policy portal project and, to a lesser extent, the first financial crisis (the subprime crisis), and, with the opposite effect, for the brevity of the description (and analysis) of the second financial crisis (the government debt crisis) and the cases of chapter 8. The Dreyfus affair has been chronicled relatively extensively both to get a consistent picture of the most important facts and to spare the reader time and puzzles.⁵³

Initially, the author only wanted to understand the unbelievable things he saw in the policy portal project. In the first place to get an answer to the question: is this true or imagination? He had not the slightest inkling that this project could become a key to the understanding of government in general. But it did.

The case studies of other projects and events were meant as checks, and as efforts to try and answer questions which had arisen in earlier work. They were meant to help understanding, and/or help to convince the author of the fact that his eyes did not deceive him, and that shocking inferences are inescapable. Especially those about the structural character of the causes. It is difficult to believe ones eyes and conclusions if most people act and talk as if the world were entirely different. Indeed, the practical insufficiency of logic and the difficulty of conviction remain the most important reasons for the length of the study. From a strictly logical point of view, and as regards the facts needed to infer and support the conclusions, the chapters 2 and 7 contain all you need, probably excepting the terroristic behavior of politicians as displayed only in the whistleblower cases of chapter 8. What the chapters 2 and 7 show is fully 100% incompatible with the hypothesis of honorable and competent government. The chapters 2 and 7 disqualify every politician with any responsibility for either specific or general government or political affair(s). To be clear: this includes all members of parliament, government, and all party bosses (if not all members of political parties). It is because of the fundamental and far reaching character of the conclusions and measures that logical redundancy has

⁵³ Several easily accessible sources leave important factual questions unanswered, and/or are inconsistent

been deemed necessary.

The destruction of dangerous ingrained illusions, and conviction of the inescapability of the presented conclusions and measures seem to require logical overkill. In addition, overkill seems the least that can be done in view of the political resistance that is to be expected against acceptance of the conclusions and measures.

3. Preview of the chapters 2-9.

A story is often easier to follow if it is already vaguely known, or if it is known where it leads. This applies especially strongly when the story is unconventional, and hard or impossible to fit into an existing mental framework. The present section is meant to enable the reader to make a first acquaintance, and to introduce the principal ideas, in the hope of making the chapters 2-9 easier to digest.

Together with the detailed tables of contents of the chapters, the following may furthermore help the reader to select the parts to read. For though nothing in the report should lack added value, or tell something that is already told in, or implied by, other parts, not everything has equal importance as regards the final conclusions and the measures. As regards the empirical evidence, the chapters 2 and 7A, the sections on supervision in chapter 7B, and the whistleblower sections in chapter 8 are the most important. The evidence they provide may be sufficient. Chapter 7B assumes acquaintance with chapter 2; chapter 9 with (at least) chapters 2 and 7. The chapters 3-5 and 8 provide additional material, which is especially important in showing the structural- which also means international- character of the causes discovered in the chapters 2 and 7. Even though the events related in the chapters 2 and 7 are unthinkable if the causes were incidental instead of structural. Chapter 8 moreover provides indisputable additional support for the conclusions about structural repression and lack of respect for people by members of governments and others.

To resume: this report was not written to be read from beginning to end. The chapters 2, 7 and 9 are essential reading. As for the other chapters: browse and read what you want.

Chapter 2. The policy-portal project.

Chapter 2 is the report of the execution of a project in the Dutch ministry of education: the policy portal project. It describes the project as observed by the author. Who was a low-level participant. In the course of the project he tried to find out everything that could be useful for his own role, and for understanding the course of the project.

The main conclusions of the evaluation of this project are:

- There was no useful result. The available budget of over 4 M€ was completely wasted;⁵⁴
- The project was intended to improve the information of the commissioning departments (= directorates). It actually made their information worse;
- IFC, the Institutional Finance Center, the organization executing the project, had a history of failed projects. There was no reason to assume that sufficient improvements had been made to justify confidence in success;
- All representatives of IFC lied systematically about the progress of the project. The situation was always presented far too rose-colored;
- Pressure was put on the representatives of the commissioning departments to acknowledge that the result complied with the specifications. That is: the representatives were expected to lie about the state of affairs;
- The management of the commissioning ministry did not show any real interest in the project. It could see and test the results on its own PC's, but never did. The management did not support its representatives at their request. It did nothing constructive at all;
- It (mis)treated the representatives of the commissioning departments as if they were the cause of the failure;

⁵⁴ All amounts mentioned in the present report are contemporary. (They are not adjusted for inflation in the years between then and now).

- An appeal to the code of conduct and the secretary-general of the ministry had no (positive) effect;
- An “independent” research bureau and the auditors of the ministry colluded with the deceivers. The auditors violated their professional code of conduct;
- After the formal end of the project, new projects were started with the same goal;
- Failure was explicitly denied, but, by the commissioning of these new projects, implicitly recognized. As a consequence of the denial no lessons were learned;
- All efforts at improvement during the course of the project were in vain. Neither ministry nor IFC has effective mechanisms for self-correction;
- Even though the project cost over 4 M€, nothing about the project was reported to parliament. Everything in the project was done as if no control had to be feared. No external organization, such as parliament or the (Dutch) General Accounting Office, ever noticed anything of the above;
- The facts of the project make it impossible to believe that the observed phenomena are the exception and not the “norm”.

Chapter 3. Project- and agency management in a ministry.

The author did not really understand what he saw in the policy portal project. That is: he could not reconcile what he saw with what he thought he should expect. One key-question seemed to be: is this an exception, or the rule? Could there be something in between? Chapter 3 is the report of an effort to try and find the answer to this question. The chapter was made possible by one of the frequent reorganizations of the ministry. It gave the author an opportunity to move into a position that enabled him to follow the developments of all the projects being executed by the agency doing the policy-portal project, IFC.

The main conclusions of this part of the inquiry are the following:

- Of the 9 projects evaluated, the best performing had only a delay; of 2 years. All other projects had either a larger delay, considerable budget excess and/or considerable underperformance;
- For none of the projects an evaluation had been made of costs and benefits. At most there were papers with a one-sided argumentation concluding that the project was necessary;
- The projects seem to have been commissioned on the basis of imaginary castles in the air;
- Possible difficulties (and costs) were systematically neglected, underestimated or talked away. It was assumed (at least said) that whatever could be imagined could be done (and profitably);
- The rules for professional project management were systematically neglected;
- Where provided, progress-reports were concealing, untruthful, and inconsistent;
- Efforts at improvement, also through the highest responsible official, were in vain;
- Serious evaluation did not take place. Neither during the project nor afterwards. Lessons were not learned. (With an unlimited supply of money there is no need);
- The higher management knew, took no corrective action, and sidetracked critical people;
- The commissioning departments of the ministry have very low expectations of the execution and results of projects of IFC. Delays, budget excess and underperformance are accepted as a matter of course. Efforts at correction are considered useless (or madness), a waste of time, and are therefore exceptional;
- Auditors, parliament, and General Accounting Office seem nonexistent;
- The inquiry confirms the systematic character of the phenomena observed here and in the course of the policy portal project.

Chapter 4. Integrity in the Dutch ministry of education and government.

In the policy portal project the author represented his department of higher education. The departments of primary, secondary and vocational education had similar interests, both in the policy portal project and the operation of IFC in general. Each of the departments had its own representative. The representatives were to make sure that their departments got what they paid for, or at least something useful. This would have been difficult enough with decent people in the project organization, and with a realistic plan. But none of these conditions was fulfilled. However, what

shocked the representatives most was the universality of the misconduct of the IFC-spokespeople, including the “managers”⁵⁵ and that of their own “management”, and the quality of the playacting of these people. Obviously, the job of the representatives was extremely unpleasant and stressful. Both IFC and their own management tried to make them believe that they were entirely wrong, and nothing but obstructive fools. Tricks were played behind their backs. Their superiors were lied to without their knowledge, and pressure was exerted to make them accept unacceptable results.

The ministry has a code of conduct. Of course, it prescribes what outsiders expect and consider normal: “good practice”. It was obvious that the code was violated on a regular basis. The author did not understand why his colleagues and he had to fight continually in order to get the project executed properly. In a way everybody would consider normal.⁵⁶ The more so in a ministry with a code of conduct. The code was signed by the highest official in the ministry, the secretary-general, “SG”. In speeches, weblogs and other statements the SG regularly made claims about the integrity of “his” ministry. Therefore, the author decided to appeal to him directly to set matters straight. In vain. The code of conduct turned out to be no more than a piece of paper. Events show that it can only be meant to deceive. To put this experience in perspective, a study was made of the way the code is supposed to function, and of the integrity policy of the Dutch government in general. Chapter 4 is the report of this study. Some of the conclusions are the following:

- The code of conduct of the ministry of education was signed by the SG. Publicly he actively propagated the code;
- The SG has been asked personally and explicitly to maintain the code of conduct. In vain. Initially, he ordered an inquiry; finally he denied any problem and sidetracked “difficult” people (and left everybody responsible for misconduct in his place, or had them promoted);
- No corrective action was ever taken;
- The SG and his deputy lie as a matter of course;
- In general, functionaries give priority to orders and perceived wishes of superiors, and ignore codes of conduct and generally recognized norms;
- The relevant publications of the General Accounting Office and of the Office for the promotion of integrity in public administration implicitly suggest that integrity violations in the public sector are exceptional and relatively unimportant;
- Nothing in these publications betrays any knowledge of the reality as described in this report. Neither do they show the least trace of an analysis of whistleblower cases such as that of Spijkers, or knowledge of the paper of Van der Vliet et al about this case;
- Neither the General Accounting Office nor the Office for the promotion of integrity in public administration warn the reader about limitations of their methodologically flawed inquiries and publications;
- Disintegrity dominates public administration.

Chapter 5. Chronicle of a Policy claim/ IAG2000!/ Renewal program.

The policy-portal project was a project of one of the two agencies followed by the author in the years 2005-2010 (approximately): IFC and IAG. IAG meaning Information Administration Group. Chapter 3 evaluates the management of projects of IFC. Before 2005 the author did not know or understand very much about IAG. He had been involved with it for more than 10 years, but almost as an outsider. In 2005 he took part in discussions about the definition of a new and big project of IAG. Contrary to the other participants he was critical and doubtful. The doubts were based on experience, inconsistencies in the project proposal, and lack of clarity of its goals. He got no answers to his questions, and left the project. By accident he got the opportunity to take part in discussions about the project at the end of the project, late 2009. It turned out that the project had failed completely. Curious as always, the author tried to find out what had happened. It was furthermore possible to observe the follow up. Which was just as amazing as the project itself, and fully consistent with its history and that of the other projects discussed..

⁵⁵ Manager is put between quotation marks because in general they do not and cannot manage. In other words: the quotation marks are meant to counterbalance the misleading suggestion of the word.

⁵⁶ Everybody outside the ministry and IFC that is to say.

Chapter 5 is a report and evaluation of this project and its management. Some of the conclusions are:

- The renewal project is an example of false pretensions, and of systematic efforts to keep them up by untruthful and otherwise inadequate reporting;
- The project followed a similar but failed project. It failed just as well. It was followed by a new (third) project with similar goals;
- In 2005 IAG claimed approximately 50 M€ without knowing whether it could spend this money in a useful and responsible way. In other words: the money came first, the “plan” afterwards (though IAG didn’t even know how to make a plan);
- The commissioning ministry never checked whether IAG had learnt the lessons from the failed earlier project, and whether it could be relied upon to execute the new project properly;
- A timely and well-reasoned warning mail of the author to the responsible undersecretary-general was ignored 100%;
- There was no sign of memory and of lessons learnt;
- The chronicle of the project provides several examples of external research organizations producing evaluations which fatally underestimate problems.⁵⁷ None of them expressed doubts about success;
- None of them enquired about lessons learnt from the earlier failure;
- As a rule, the research organizations make a potentially fatal methodological error. Most of what they say is based on interviews with interested participants;
- The commissioning ministry’s attitude towards IAG was ambiguous and misleading;
- The hypothesis that everybody tries to do things as good as possible is untenable. The behavior shown in the report is unthinkable if participants knew they would have to account for their behavior publicly;
- The report of the project shows selection phenomena that maximize the probability of failure. Thinking people are sidetracked, blind optimistic believers are given key functions;
- The ministry of education and IAG act like swindlers: they claim (more) taxpayer money with false promises;
- The start of the 50% more expensive follow-up project shows no improvement over the start of the failed project.

Chapter 6. Analysis of the chapters 2-5 regarding the internal operation of hierarchical organizations.

This first analytic chapter concerns the internal operation of government organizations, as seen in the chapters 2-5 and in a few sections of chapter 7. The “internal operation” includes the management. The following are some of the conclusions drawn from analyses of the chapters 2-5:

- The management of these organizations is characterized by false pretensions. It claims to be what it is not, and to be able to do what it cannot. There are false pretensions in almost every field: in technical fields like information technology, but also in integrity, inquiry and management. The false pretensions are very detrimental to the integrity, effectiveness, and efficiency of the organizations;
- The management does not take its own internal agreements and promises seriously. The agreements and promises sometimes seem to be made only for the record, to mislead future investigators who assume (without checking) that words reflect reality;
- The top management is characterized by irresponsible behavior. For example by approving something it doesn’t understand, or against better judgment;
- The top management dishonors people of whom it knows that they did their duty, and that they refused to collaborate with misconduct. It does so in an underhand way, without accounting;

⁵⁷ The adjective “fatal” and adverb “fatally” are used when serious harm is actually caused. An error need not cause harm; a fatal error does, or has already caused serious harm. “Evaluations which fatally underestimate problems” failed to prevent (costly or worse) failure. A reliable, open evaluation could have prevented failure.

- The top management (publicly) rewards people whom it knows did not and cannot do their duty; who failed grossly and avoidably; pretend that everything goes fine; and harm people who say otherwise in order to keep up appearances;
- When reporting, it is assumed that everything is permitted in order to be able to paint a positive picture. Lies included. Failure and its causes are not mentioned, or lied about, making correction difficult or impossible;
- This also applies to audit organizations like the (Dutch) General Accounting Office and the internal audit department of the (Dutch) education ministry;
- Managers violate the code of conduct of the organization at discretion;
- Employees of the audit department violate their professional norms, and commit forgery. Possibly at the request of the top management. But they may also have been selected for having a good intuition for what the top expects of them;
- The organizations operate (almost) as if there is no supervision, and no sanction for misconduct. In particular, the observations are consistent with absence of any form of parliamentary control;
- The organizations are essentially corrupt: they are characterized by socially harmful, improper conduct.

Chapter 7. The financial crises of 2007-2013.

Chapter 7 consists of two parts and a set of appendices. Part A is a chronicle of events directly related to the financial crises of 2007-2013. Part B gives an analysis of the events, of the behavior of responsible actors, and of concepts and phenomena which are crucial to understanding the events. The chapter is based on the work of the Dutch and US parliamentary inquiry commissions CDW and FCIC, on the appendices, and documents in the archive.⁵⁸ Most of the appendices are reports of studies of individual actors and organizations. For reasons of readability only part of the results of these studies has been integrated in parts A and B. Of course, restriction to summaries and conclusions has a price. There is quite a difference between the effect of reading that a supervisor has failed systematically, and seeing all kinds of nonsense mixed up in one annual or hearings report after another. In order to convince him or herself of the fundamental and systematic failure of the present political and supervisory system and of those occupying the key positions in this system, the reader is strongly recommended to study at least a few of the appendices and their sources.

Chapter 7 is a very welcome complement to the chapters 2-5. The chapters 2-5 mainly show phenomena inside a ministry. That is: inside a large government organization. Chapter 7 shows other kinds of phenomena. The most important phenomenon seems to be the (dys)functioning of organizations and people with key roles in the financial and political systems. Through annual reports and the hearings of CDW and FCIC, the financial crises show the lack of integrity and competence of all the (ir)responsible people, including the inquiry commissions. They show the extent of the failure of the system. Not just a few organizations or top people failed. All of them failed. Without exception. The system failed as a system, and not only in the financial sense. Last but not least the chapter shows a 100% absence of effective self correction.

As regards the causes of the subprime crisis and the government debt crisis, the following conclusions are drawn:

- The financial institutions in the restricted sense- such as banks- could have prevented the first crisis by applying stricter than legal norms at the cost of their position with respect to the competition;
- By its housing policy the US government actively stimulated people and financial institutions to accept unbearable risks. The housing policy significantly increased the relative number of high-risk mortgages. The housing policy is the best candidate for “cause” of the subprime crisis;
- Supervisors and governments could and should have prevented both crises by fulfilling their (legal) duties. This can be seen as the “cause by omission”;

⁵⁸ CDW= Commission De Wit, FCIC= Financial Crisis Inquiry Commission.

- The financial institutions in the restricted sense could not have prevented the second crisis;
- The supervisors could and should have prevented the second crisis. They could if at least a few of them had warned unanimously.

The financial crises are “large” cases. They show many different kinds of shortcomings and failures. The following are some of the more general conclusions:

- The members of the governments and parliaments of the OECD countries,⁵⁹ the heads of the various supervising organizations, and the heads of many financial organizations have demonstrated a fatal lack of integrity and competence;
- This was the cause of the crises. Not the unpredictability of fatal phenomena. An authoritative organization, the US General Accounting Office (GAO), had given well-reasoned unambiguous warnings about the processes which precipitated the subprime crisis. Every financial expert should have been able to reproduce its argumentation and conclusions;
- Even if they would be able to evaluate people correctly, untruthful and incompetent people will not appoint honorable competent people in positions of power. Such people would surely have them removed from any influential position;
- Due to the inadequate and unequal law, politicians and top “managers” who take unbearable risks need not fear negative consequences for themselves. In combination with other circumstances, this creates unlimited risks for human society and life on earth;
- Reminder: the law is made by governments and parliaments;
- The present social organization, as induced and controlled by present laws, precludes occupation of top functions by honorable and competent people;
- Both in organizations and the sociopolitical system, self-correction mechanisms are absent or insufficient;
- It is highly unlikely that nobody in the relevant ministries and supervising organizations knew about the GAO reports, and/or understood the processes and risks. Only dishonesty and incompetence of the “management”, in combination with repression made possible by the hierarchical (dictatorial) character of these organizations, can explain that nothing was done with their insight;
- Codes of conduct and whistleblower regulations had no observable effect. The facts explicitly and implicitly show that codes of conduct were violated regularly;
- The widespread failures can be partly ascribed to a variety of defects in education;
- Education (at all levels) fails to prepare for the real world. It does not teach a questioning attitude, to critically evaluate answers, and to reject nonsensical answers. It does not teach to fight the social pressure to tolerate harmful nonsense;
- As regards the financial-economic matters, education in the most relevant disciplines, such as law and economics, has potentially fatal defects;
- There is no sign of improvement of education and research. There is evidence of continuing if not increasing corruption;
- Governmental or parliamentary inquiry commissions lacked integrity and competence. Their reports do contain much useful information, but their analyses are fatally flawed;
- The inquiry commissions questioned top officials as if they were reliable experts: honorable and competent. From the facts and preliminary studies of the crises, the commissions could and should have known that this assumption is incorrect. The inquiry commissions could have obtained all necessary information from historical documents. Most of the hearings served no other purpose than offering culprits the opportunity to exculpate themselves;
- Although many of the relevant organizations have thousands of staff, the commissions as a rule questioned only top functionaries (“managers”), with only very few exceptions. The commissions showed no interest in their management or the functioning of their organization;
- In their hearings, the inquiry commissions did not ask questions of which the answer would reveal one or more of the conclusions of this study. They did not ask questions of which the answer would reveal that the responsible person was unfit for his job.

⁵⁹ OECD= Organization for Economic Cooperation and Development, an international organization of states.

Chapter 8. Other examples.

Chapter 8 gives concise descriptions and analyses of more than fifteen other cases. It mentions several more. The findings are consistent with the conclusions of the earlier chapters. They are incompatible with denial of these conclusions. The cases of chapter 8 support the hypothesis of the structural character of the phenomena described and analyzed in the earlier chapters. Wherever you look, you see the same kind of phenomena. Possibly more than other chapters, chapter 8 shows that politicians do not respect even the lives of other people.

The chapter starts with four whistleblower cases. When analyzed thoroughly, these cases reveal very much more than can be gathered from contemporary information by the media. Logically speaking even a single whistleblower case furnishes more than enough evidence of the lack of integrity and competence of the whole political world. The other cases, in this and other chapters, are not logically necessary to reach this conclusion. But they do show the extent and consequences of the corruption, and they do help with their explanation. They help to convince the reader of the inescapability of the problem. Like the financial crises, the whistleblower cases show a total absence of ability and/or willingness of the political world to correct itself. The given system evidently lacks effective mechanisms for (self) correction.

Some of the case-unspecific conclusions of this chapter are the following:

- Many conclusions from the cases in this chapter coincide with conclusions from earlier chapters;
- No contradiction was found;
- In particular, the cases demonstrate the lack of integrity and competence of the responsible politicians. (Real) Openness could nowhere be observed;
- Most of the cases show inexcusable misconduct. By implication they show the lack of integrity of those who help to keep perpetrators and responsible people in power, and laws unchanged;
- None of the responsible persons has given an acceptable account of his or her (mis)conduct. They say that they have done what they could or should, or deny any wrongdoing. This was accepted by parliaments and inquiry commissions;
- The responsible people are characterized by (consequential)⁶⁰ false pretensions;
- Their interrogators did not pose questions of which the truthful answer would have been unacceptable to the public, and would have revealed one or more conclusions of this study;
- In many cases (much) avoidable damage was caused. Often it was irreparable. Where compensation was paid, costs were mostly covered by the taxpayer. Only a negligible part was recovered from the responsible actors;
- Which can be imputed to the law;
- Control and self-correction of organizations is insufficient or absent;
- External control and correction by parliament or supervisor is insufficient or absent;
- In most cases damage could and should have been prevented by the relevant supervisor;
- All observations support the hypothesis that repression almost completely prevents internal reporting of misconduct, and that chances of success of an internal report about misconduct are almost nil;
- The observations support the hypothesis that misconduct is made easy, or caused, by the legal regulation of the hierarchical organization. The head of a hierarchical organization is a virtual dictator. Repression is easy. Without external help, correction of a dysfunctional “management” is extremely difficult, and often impossible;
- Governmental or parliamentary inquiry commissions almost always lacked integrity and competence. Their reports may contain useful information, but their analyses are fatally flawed. They don’t see any weakness or error in the political or legal system;
- There is no sign of developments supporting belief in improvements which reduce the probability of occurrence of similar cases. No changes have been made which make misconduct by responsible politicians unattractive, or remove barriers for self-correction of organizations.

⁶⁰ In the sense of: “having significant consequences” (Merriam-Webster 2002).

Chapter 9. Final analysis, conclusions and measures.

Chapter 9 is devoted to general analyses and conclusions, and to measures which need to be taken if phenomena like those described in the earlier chapters are to be ended and prevented. Where the adjective “general” is used as the opposite and complement of case-specific.

The chapter begins with a review and analysis of the characteristics of the kind of people who are responsible for the phenomena and events described in the earlier chapters, including the lack of systemic improvement. Main characteristics are:

- Consequential false pretensions;
- Intelligent, but not enough for the job, and lacking the necessary integrity and competence;
- Born actors and swindlers. Integrity and competence are only pretended;
- Seem to think they know better what is good for us than anyone else, and that this gives them the right to dictate the law and to overrule everyone;
- Never acknowledge lack of integrity or competence, or falseness of pretensions;
- Try to keep up appearances at all costs;
- Always cover their colleagues, never criticize them;
- Have no real respect for people outside their own group;
- Don’t feel really responsible: are very good at story-telling, but don’t give an account that can pass muster;
- Are nearly never held liable or punished for harm caused;
- Are 100% successful in avoiding social improvements that endanger the position of their kind.

The chapter next tries to explain how a political elite consisting of dishonorable and incompetent people comes to dominate society, and how it can survive even its greatest failures, such as wars and crises, and how it can prevent fundamental improvement. Elements of the explanation are:

- Social organization characterized by top functions with impossible requirements;
- Meaning that top positions can only be occupied by people with false pretensions;
- With regard to both integrity and competence;
- There is no effective accountability for top functionaries. Due to an inadequate supervisory/-control system, and inadequate (unequal) liability, criminal and procedural law, top functionaries have nothing to fear from dysfunctioning;
- Hierarchical organization gives a tiny minority almost dictatorial powers. Hierarchical organization effectively makes the opinions of subordinates, that is: everyone below the top, irrelevant. Subordinates are made to understand that there is no crime worse than blowing the whistle on harmful misconduct;
- Hierarchical organizations are closed and opaque: outsiders are not allowed to see what happens inside. Outgoing information is censored. This hinders self-correction and causes a positively biased picture of organizations and their bosses;
- By forgetting and making forget, and because they depend on news providers, the media prevent learning, and actively help the establishment stay in power;
- Education is inadequate. Insufficient attention is paid to how things are, to understanding the relation between law and reality, and to preparation for the real world;
- Socially important sciences, such as law, economics, psychology, political and social science, lack integrity. Phenomena as described in this study are ignored instead of accepted as proof of the incorrectness of crucial theoretical assumptions;
- Mistaken illusions and faulty reasoning (wishful thinking without checking);
- Such as seeing only actions as a cause, and not failure to act when duty requires action;
- Interests having the same effects as censorship. The interests are partly created by the redistribution, by politicians, of taxpayers money. That is: the redistribution of about half the national income;
- In general, employees are subservient and taciturn. Except in very rare cases of whistle-blowing, violations of codes of conduct or failure to act as duty demands do not elicit noticeable reactions from employees. The terroristic attitude of the top towards whistleblowers can be seen as part of a culture of repression, and as the explanation of the silence of the

employees.

After the final analyses, and before the presentation of the measures, the general conclusions of the study are enumerated. Some of the more important are:

- Most cases would not have been cases if the responsible functionaries were competent and honorable, and therefore would have acted as they should have;
- In particular, the financial crises would not have taken place even if only part of the responsible government functionaries would have acted competently;
- All cases show a fatal lack of integrity and competence of all responsible functionaries;
- Responsible functionaries hardly if ever acknowledge failure or lack of integrity or competence;
- No failure to act as required had worse consequences for the responsible functionary than transfer to another well-paid position of power;
- Most of the victims of government failure (and harassment by government officers) have not been compensated;
- Codes of conduct have been violated systematically. The codes can only be meant to mislead outsiders;
- Governments, including parliaments, are characterized by false pretensions;
- There is no effective control of government. “Supervision” and “parliamentary control” are no more than examples of false pretensions;
- The present governments lack the competence to tackle the main actual problems. They lack the competence to avoid avoidable disasters. They do not understand the problems. They can choose nor understand their (independent?) advisors. There is nothing that resembles adequate risk management on a national or international level. Present governments must be expected to mislead and fail;
- Parliaments do not represent the people but their government and/or party;
- The (hypothetical) mechanisms for (self)correction are fatally inadequate;
- In order to avoid similar crises and far worse catastrophes relatively obvious but nevertheless far-reaching measures are necessary;
- History becomes much more understandable if thinking in terms of a single national culture is replaced by thinking in terms of several different cultures.⁶¹ Especially a culture of the top and a culture of the rest of society. Where the culture of the top is characterized by lack of respect.

The chapter is concluded with a section “Measures”. The principal purpose of the measures is to safeguard people from avoidable harm caused by others, especially governments. It is argued that the measures are both necessary and sufficient. To be clear: necessary and sufficient to avoid avoidable disasters. For this reason they are not “proposed” or “recommended”. They can be grouped under the following headings:

- Consequent liability and criminal law;
- Redefinition and redistribution of jobs and/or duties. All jobs and/or duties should be fulfillable by real people;
- Abolishment of (dictatorial) hierarchical organization. (This can be seen as consequence of the preceding);
- Education that prepares for participation in society as it is;
- Honorable science that gives the well-being of mankind a higher priority than the indiscriminate increase of knowledge in irresponsibly chosen fields;
- Parliament and representation;
- General standing⁶² for complaints about action and failure to act in public administration.

⁶¹ “Culture” refers to the set of norms and values. As manifest in people’s activities.

⁶² «Standing is the determination of whether a specific person is the proper party to bring a matter to the court for adjudication. The Supreme Court has declared that “[i]n essence the question of standing is whether the litigant is entitled to have the court decide the merits of the dispute or of particular issues”» p. 60, *Constitutional Law*, 3rd edition, E. Chemerinsky, Aspen Publishers, ISBN 0 7355 5787 X. By “general standing” we mean standing for everyone. After all, everyone is affected by government, and government is responsible to everyone.

The report concludes with a warning. The conclusion about the lack of integrity and competence of the political elite is irrefutable: the phenomena described in this report could not be more inconsistent with integrity or competence of government. The present elite cannot cope. It lacks essential abilities and attitude. It will resist and fight the changes which are necessary for mankind's survival. The report shows that illusions are outright dangerous. Without the changes indicated, terrible disasters are not only possible or probable, but guaranteed.

Chapter 9 has an appendix. It gives an outline of a constitution of a communicative society. With the exception of the law of logic, and in order to comply with it, all (other) regulations of such a constitution are voluntarily. The appendix shows that and how a society can be organized on a voluntary basis. It shows that there can be law and order without a need to impose authorities, rules and institutions against the will of a part of the population.

The outline is meant to show that the existence of peaceful alternatives to the present political systems is not just empty talk. Alternatives are shown to be feasible. The appendix is meant to show that a respectful society can be organized, and that there is no need of dictatorship, either by majorities of "representatives" or otherwise, and to impose anything by force.

The report is concluded with a personal afterword, in which the author reflects on the understanding of the world of mankind as gained by the work on the report.

First of all it is noted, that the deficiencies and ensuing failures of human beings especially in responsible positions, can be explained by the impossibility of adaptation from life as an animal among animals to life in large human populations, in a time span that is very short in terms of biological evolution. Upon reflection, adequate adaptation must be considered impossible. An explanation is no excuse however. The explanation nevertheless shows that authority cannot have a solid foundation. The explanation strongly supports the need of modesty. And therefore of a fundamentally different social organization, which does not assume non-existent mental capabilities.

Secondly, it is noted that it is one thing to know that and how human affairs can be organized respectfully, and quite another to know how to realize a respectful system. Given the findings of the report and personal experience, the author sees no way. Informing the public about the findings of this report probably is a necessary condition. But it certainly is not sufficient.

Thirdly the author explains his thorough disappointment at the betrayal of their own norms and values by journalists and scientists, and to a slightly lesser extent (other) teachers. Their pretensions are false. Without their conscious or unconscious support, the given political systems could not and cannot survive. Journalists, scientists and teachers prevent improvement and correction, and facilitate repetition of crises and catastrophes. Conscious support means outright deceit. Unconscious support does not mean innocence: causing harm by pretending to be able and to do what one cannot and does not is criminal in the sense of the law of logic.

Some sections are not divided in subsections, but consist of two parts: a subsection "summary and conclusions" and the text proper. In such a section, the end of the subsection summary and conclusions is marked by a black square: ■.

Chapter 2.

The policy portal project.

Table of contents of this chapter.

1. Chronicle of the policy portal project (PPP) in a nutshell.
2. Summary and conclusions.
3. Introduction.
4. A history of the PPP.
 - 2004 and 2005.
 - 2006.
 - 2007.
 - 2008.
 - 2009 and 2010.
5. Epilogue.

2.1. Chronicle of the policy portal project in a nutshell.

The policy portal project (PPP) was commissioned by and for the Dutch ministry of education, and executed by one of its agencies, IFC, the Institutional Finance Center.

- 2004: Preparatory discussions and planning.
- 2005: Promising & pretentious presentations by IFC of a hypothetical policy portal: an internal website with information about the education system.
Agreement about a *Global plan*, *Portal requirements*, and a budget of 4 M€ for release 1 of 3.
Contrary to the *Global plan*, release 1 of the policy portals for the departments higher education (HE) and professional and adult education (PAE) are not ready by the end of the year. Not by far. A “Première” is cancelled.
- 2006: The policy portals for the departments of primary and secondary education (PE and SE respectively) should be ready by April 1, but aren't. Not by far.
Mid-year a new steering committee is installed.
At the end of the year the lower part of the line management for the PPP in IFC is replaced.
- 2007: Vain effort to make a new beginning with the new IFC managers.
Grossly defective drafts of a *Discharge protocol* and *Service level agreement*.
Inquiry by external consultancy firm VKA of implications of governmental directives for websites.¹
Deliberations with the secretary-general of the ministry in pursuance of an appeal by the present author to enforce the code of conduct of the ministry.
A defective quick scan audit of PPP (audit 1) only leads to another audit.
- 2008: Two more audits of the PPP (audits 2 and 3). The report of the first is kept secret, the report of the last denies non-performance, and accuses departmental representatives of obstruction.
Top level deliberations about sequel. Main conclusion: new departmental representatives.
- 2009: A new beginning fails. The top management concludes that continuation of PPP is meaningless.
The datawarehouse, the foundation of the policy portal, turns out to be defective. M€ 2.3 is made available for repairs or new beginning.

¹ VKA= Verdonck, Klooster & Associates B.V.

2010: PPP is terminated formally. The project has produced nothing useful. The information of the education departments is worse than it was in 2005.

2.2. Summary and conclusions.

1. Up to and including 2005 the education departments themselves took care of the collection and management of the quantitative information they needed. In 2005, in order to make these activities more efficient, the four education departments accepted a *Global plan* of IFC for a policy portal. IFC was the agency responsible for the actual distribution of tax-money to educational institutions. It presented the policy portal project as an investment that would repay itself. The policy portals should eliminate the need of the education departments to collect and manage quantitative information by themselves.
2. Release 1 (of a total of 3 releases) of the PPP would cost 4 M€.
3. Notwithstanding the fact that IFC had a history of failed ICT-projects, its pretensions regarding the PP were fantastic.² It is not clear why the IFC management thought that it could bring this project to a good end (if it did). Neither is it clear why the responsible persons in the ministry thought IFC could (if they did).
4. The department of higher education fired the people who were responsible for the collection and management of quantitative information. At the moment it did so, there was good reason to doubt the success of the PPP.
5. Already in 2005 the time-table was exceeded without explanation. IFC said it had delivered what had been agreed upon. This was evident nonsense.
6. The representatives of IFC systematically failed their promises. They did not give acceptable explanations.
7. The progress reports of IFC were incomplete, misleading and sometimes contained important lies.
8. The representatives of the education departments always informed their superiors timely, fully and correctly. This never resulted in effective action with respect to IFC. The higher management never showed signs of sharing the concerns of its representatives. Instead it sometimes took action that frustrated the proper functioning of the representatives.
9. The periodic consultations of the top managers of ministry and IFC were systematically abused by the IFC management to give the top of the ministry a rosy or incorrect picture of the state of affairs, and to generate pressure on the education departments to accept a useless product.
10. The managements of ministry and IFC have shown competency only as regards misleading and repression. Their behavior is dishonorable with respect to all points of the definition of integrity of the secretary-general of the ministry: «[Our behavior with respect to each other and to the outside world should be open, service-oriented, respectful, impartial, and reliable. In a single word, honorable.](#)»³
11. The managements of ministry and IFC failed to do what was necessary to accomplish the goal of the PPP. Failure was never acknowledged. Until failure became too evident, they remained in a state of denial.

² ICT= information and communication technology.

³ P. 3, Code of conduct of the ministry of education. To be found in directory Integrity under 20050620. In the present report a person is called open, if he tells those concerned everything that is of interest to them, in their opinion. He doesn't wait till asked, and doesn't avoid answering.

12. The PPP is a complete failure. It produced nothing useful. M€ 4.5 was spent without any useful result. No (positive) lessons were learned.
13. The information of the department of higher education has become worse instead of better.
14. The PPP had no positive results, but it did have negative ones. In both the ministry and IFC the following notions are confirmed:
 - a. that the top managers lack integrity and competence,
 - b. that they cheat their own people,
 - c. that resistance against fraudulent behavior of IFC is punished, and
 - d. that IFC can cheat with impunity and is rewarded for failure with new contracts.
15. The pretensions of IFC, that is: its top management, regarding its abilities and promises were false.
16. IFC has tried to keep up its pretensions by all kinds of dishonest means, including lies and blackening representatives who only did their duty. It never acknowledged the falseness of its pretensions.
17. The PPP is an example of history repeating itself. The description in section 2.4 shows that this can be explained by false pretensions and money-hunting of dishonest and incompetent managers, and by the absence of any need for accounting.⁴ Staff who think independently and talk openly are shoved aside, and the positions of “optimistic” risk-takers and/or yes-people are improved.
18. Nobody in the higher levels of the relevant hierarchical lines of the ministry ever showed more than the most superficial interest in the useless product their staff would have to work with if IFC got its way. Even though it was simple to inspect the portal on their own PCs, they never did.
19. Instead, they blindly accepted IFC’s assertion that not their product but the representatives were the problem. They never took the departmental representatives and their complaints seriously. They never acknowledged the legitimacy of the complaints. They joined IFC in putting pressure on the representatives.
20. So that the departmental representatives had to fight on two fronts: against IFC and against their own management. (The representatives explained their behavior; the managements never did).
21. For years IFC and the top of the ministry treated the departmental representatives disrespectfully and unjustly. The representatives were cheated by their own management. The complete failure of the project proves that the representatives had been right in not accepting the “products”, and had done what behooves good civil-servants. This was never acknowledged.
22. On the other hand, no action was taken against the managers of IFC, notwithstanding their obvious mismanagement, false pretensions and outright lies.
23. The underhand instead of open behavior of the top of the ministry shows that there were no legitimate reasons for protecting the management of IFC.
24. The consultancy firm VKA and the audit department of the ministry turned out to be dishonest and incompetent.

⁴ And by implication: far too easy (taxpayer’s) money.

25. The code of conduct of the ministry was trampled under foot by the top of the ministry, the management of IFC, and the audit department of the ministry. The author has personally asked the secretary general to maintain the code of conduct of the ministry. In vain.
26. The authors of the audits 1 and 3, members of the audit department of the ministry, have violated their professional code. Those of audit 3 are guilty of forgery.
27. The behavior of IFC can be explained by lack of integrity, competence, and an excess of pretensions. No manager ever acknowledged that IFC claimed too much. Instead, IFC always claimed to have produced what was agreed upon, and that the accusations of non-fulfillment were attempts at obstruction.
28. There doesn't seem to be an obvious and convincing explanation of the behavior of the top of the ministry. Some people believed in the existence of a hypothetical but unknown interest that justifies the expense. Since nobody was able to identify this interest, the hypothesis may be no more than an illusion, based on wishful belief in rational behavior on the basis of interests. The most plausible explanation seems to be: keeping up appearances: "we always take the right decisions, we make no mistakes, and never fail". On the other hand, the (immortal) costs of the misconduct are very high: demoralization of the organization due to behavior which is inconsistent with generally accepted norms and values, and the (relative) promotion of dishonest and incompetent staff. In other words: (increasing) the corruption of the ministry and its agency.
29. It is incorrect to think in terms of a culture of the ministry or agency.⁵ There is no single organizational culture. There is a culture of the top and its court, and quite another culture of the other part of the organizations.
30. Charging IFC with the development of ICT-products is irresponsible until substantial improvements have been proved, and, by implication, until the corrupt and incompetent management has been replaced by honorable and competent people.
31. The observed phenomena cannot be explained by specific properties of the PPP. They can all be traced to more general causes, in particular false pretensions. Which affect all projects, and many other activities in the ministry and IFC. The failure of the project was moreover complete. It follows that it is efficient to stop all similar projects, and not to start new ones.
32. The responsible dishonorable and incompetent managers are maintained. Some were promoted. They didn't learn anything from earlier failures. Therefore, no improvement may be expected. And indeed, no sign of improvement can be seen.
33. Neither ministry nor IFC has shown an ability to correct itself. Worse, their managements actively resist correction. Resistance by the majority of the employees is absent and useless.
34. From the characteristics of the very many unacceptable phenomena described in this chapter it follows that they are systemic, and dominate all activities of the organizations concerned. Most of the phenomena have nothing to do with ICT.

2.3. Introduction.

The very first version of this report was no more than a description of the policy portal project in the period August 2005- June 2007. The present chapter is the completed version of this report: a description of the project from beginning to end. The first version was written in the summer of 2007. It was meant to inform the secretary-general (SG, Koos van der Steenhoven) and the undersecretary-general (uSG, Simone Roos). It was meant to show that they should act in order to correct the

⁵ A culture is understood as a consistent set of norms and values.

misconduct of IFC-people. The remainder of this chapter, and the rest of this report, were written after it had become clear that SG and uSG not only did not act as requested, but even obstructed improvement. And after it had become clear that at least in the education ministry, the observed phenomena are not the exception but the rule.

The chapter is meant to show the functioning of people in a ministry. It is meant to be part of the empirical basis for efforts to explain the observed, similar and related phenomena, and for measures for improvement.

The chapter is a translation and abbreviation of the corresponding Dutch chapter. Abbreviation has been accomplished by summarizing, and by deleting what seems less relevant for the analyses and conclusions. For more context and details the reader is referred to the Dutch edition and the documents in the directory PPP of the archive. Obviously the original is closer to, and gives a better feel of reality. However, for the analyses, explanations, and measures, the translation and abbreviation would seem to be sufficient.

The PPP was developed by an agency of the ministry, the Institutional Finance Centre (IFC). The primary duty of this agency was the actual payment of the educational (and various scientific, and cultural) institutions according to budget laws and regulation. Formally, IFC was not independent, but part of the ministry. Its offices were in Zoetermeer (The Netherlands), which is about 12 km east of the ministry in the center of The Hague (on the North Sea).

The policy portal project was meant to reorganize the collection and management of the quantitative information used by the education departments of the ministry. Access to the information was to be modernized. In other words: the policy portal was to be an internal information website. Nothing else. By using web-based “portal technology” IFC meant to build a portal, a kind of website, for each of the four education departments. To wit: the departments of primary education (PE), secondary education (SE), professional and adult education (PAE), and higher education (HE). These departments were to pay the costs. The project was presented as an investment which in time would pay itself back. As regards HE, the project would result in the removal of 2,5 fte information-activities from HE to IFC.⁶

The content of the portals was specified by the education departments, and agreed by IFC. Each department appointed a representative for the project. The author represented HE. The representatives were the eyes and mouths (spokesperson) of their department. Their foremost duty was to ensure that their departments got what they needed and paid for. They took care of daily communication, and reported to the management of their department when necessary. In its turn, IFC had appointed a representative for the PPP for each of the education departments. Further details of the organization of the PPP in IFC can be found in the directory PPP.⁷

On the side of the ministry not the departments but a director-general (DG, DGPS Rob Kerstens) was formally responsible for the project. He was representative of, and responsible to, the uSG. The uSG was responsible for everything regarding IFC. Including its budget. She could overrule departmental decisions regarding IFC.

On both sides, ministry and IFC, about 10 people were involved in the PPP. External people hired by IFC not included. The project budget of 4 M€ only represents the costs on the side of IFC.

The author regrets that he cannot tell more about what happened inside IFC.

2.4. A history of the policy portal project (PPP).

2004 and 2005.

In April 2004 IFC distributed a “Plan for the repositioning of the information chain HE-IFC”.⁸ The purpose of the repositioning was the transfer of 2,5 fte information-activities from HE to IFC. The activities to be transferred were specified in an appendix. The specification was unambiguous and

⁶ Fte= full-time equivalent. Fte is a measure of the amount of manpower. Irrespective of the nature or quality of the work.

⁷ For example the files under 20050201 and 20050717.

⁸ In the PPP directory under 20040413.

covered all basic information. The repositioning should be completed by the end of 2005. But it was not to be a simple, passive transfer. The activities were to be reorganized and modernized as well. In particular, web-based “portal technology”, was to make information more accessible to more users. IFC meant to build a portal, that is: a kind of website, specifically for HE. For the other education departments there were similar plans.

By means of these plans, other documents and presentations, IFC raised great expectations.⁹ The plan of April 2004 promised that by the end of 2005 all HE-relevant information would be accessible through the HE-portal. A presentation of 28/4/05 stated that the numerical information should be checkable and reproducible. It stipulated that the quality standards were to be set by the education departments. In sum, realization of the plan would mean a major step forward in the information situation. No sensible person could oppose it.¹⁰

Up to and including July 2005, HE was represented in the PPP by Pieter Veen. On August 1, 2005 Veen moved from the information & analysis section of the department to its financial section. The head of the information & analysis section, Frans Dijkstra, asked Jan van Velsen, the present author, another member of his section, to succeed Veen. Dijkstra told Van Velsen that he was afraid that IFC would not build what it had promised and what had been agreed. Dijkstra expected IFC to try and dictate what HE needed. He asked Van Velsen to watch out, and try and get the best possible.

After having been informed by Veen and having studied the relevant documents, Van Velsen called upon the representatives of the other education departments to get acquainted and informed. In the course of the project he expanded his network of contacts as need arose. Among others with the departments of information policy (IP) and financial affairs (DFA), and with the assistants of the two education directors-general and of the uSG. With all of them he systematically discussed the situation, and proposals for what to do next. In general it was easy to reach agreement. The same approach was followed with respect to IFC. But there agreement was rarely possible, if useful. No one of IFC ever gave a reliable and useful picture of what was going on in IFC, of its problems or their causes. Last but not least, people from IFC almost never kept their promises.¹¹

The plan of April 2004 was written by IFC, and no more than a draft. The discussions about plans that were to be binding, one for each education department, were very wearisome. The plan for HE was signed 14/6/05. It wasn't signed because there was agreement, but because agreement seemed impossible, and because signing seemed less costly than waiting. In addition, IFC had recently told the ministry that it had already engaged (external) subcontractors. A prototype of the HE-portal had already been built, and looked promising. The HE-plan presented the prototype as representative for the portal. According to the plan, formal acceptance of the HE-portal by HE could take place 15/12/05 at the latest.

Beside the four department-specific plans there was a general plan for matters of common interest.

The plans distinguish three “releases” of the portals. The first release for HE and PAE was to be completed in 2005, that of PE and SE in March 2006. The total cost of release 1 was estimated at approximately 4 M€. Because most of this amount was needed to build a common datawarehouse, the education departments agreed to pay equal parts.¹²

The plans specify the information contents of the portals. But they do not specify the technical and quality requirements of the portals. For that purpose a document *Portal requirements* was adopted in August 2005.¹³ It is a rather remarkable document. For the following reasons:

- It explicitly accepts the governmental and ministerial directives for websites (which are mainly logical but not always simple to realize in practice);
- It explicitly gives the education departments a blank check for specifying requirements for

⁹ See in particular the presentation of 20050428, confirming completion of the HE-portal in 2005.

¹⁰ Unless because of the costs, or bad cost/benefit ratio.

¹¹ Regarding the PPP.

¹² HE had very much more content than the other three departments, probably more than the other three put together. Therefore the agreement about equal cost sharing shows that the representatives thought that building the datawarehouse was much more costly than building the web interface. See the memorandum of 20050905.

¹³ Programma van Eisen. In the PPP-directory under 20050816.

- accessibility and user friendliness;
- It allows response times of 5 seconds for simple tables, and 30 for multiple choice tables.

The first two points show that at the time of writing IFC did not understand that a portal is much more complicated than a collection of spreadsheets or a database, and that IFC very much underestimated the difficulty of building a user-friendly portal in accordance with applicable directives. The lack of understanding by IFC explains at least in part why IFC wanted HE to accept not the portal but separate tables. HE saw the portal as a whole. As much more than a set of tables. It should also be a properly working website. HE was afraid that acceptance of tables would be construed as acceptance of the portal, even if the portal didn't work as a portal at all. For this reason HE refused to accept separate tables. It wanted to test the portal as a portal. It would check the tables too, but only as a part of the portal.

In September 2005 IFC dropped the prototype, and switched to an “acceptance-portal”. It did so without prior discussion or explanation. Although the prototype was incomplete, it worked and looked credible. The acceptance-portal was very different. It was almost empty and hardly worked. It looked like a major step backwards. The plans suggested continuous development. The HE-plan saw the prototype as the norm. Nevertheless, and notwithstanding repeated requests, IFC never explained the switch. In its progress reports the switch isn't even mentioned.

In the beginning of October, Maurice Fransen, the IFC-representative for HE, told Van Velsen that the HE-portal was nearing completion. He asked Van Velsen to test the portal, in preparation of formal acceptance. HE tested the portal in the weeks around the first of November 2005. The test was performed by six members of the department (Van Velsen supervised, but didn't test). The conclusion was that the portal contained only a small part of what was agreed upon, and that the portal hardly worked as a portal.

The PAE-portal was just as useless.

In November the head of IFC, Ineke van Oldeniel, sent invitations for a festive “Première” of the policy portals to all concerned. The “Première” was to be held on 7/12/05.¹⁴ It was clearly meant to be a show-event. Van Velsen was afraid that attendance of the “Première” by the responsible managers of the ministry would dangerously weaken the negotiation position of the departmental representatives vis-à-vis IFC. He therefore wrote his head of department, Jo van Ham, a memorandum describing the state of affairs, including the test results. He advised him to stay away from the “Première”, and to ask IFC to postpone the “Première” until the portal was ready. Van Velsen requested permission to send a formal memorandum to the director-general informing him about the situation, and requesting him to abstain from attending the “Première”.¹⁵ This request had been discussed with the assistant of the DG and the financial assistant of the uSG. They had agreed with it.

Van Ham replied that he would phone the head of IFC about the situation.¹⁶ Van Oldeniel told him fairytales, which Van Ham believed. He accepted the “explanation” that the “Première” was not a première. It was only an “event”, a “preview”.¹⁷ He seems not to have asked why it wasn't called “Preview” if it was meant to be that, instead of “Première”. Van Oldeniel furthermore told him that PAE was satisfied with the results. This was simply untrue. But Van Ham believed it without checking. He concluded that he would attend the “Première”, and would not inform the DG.¹⁸

It follows that the head of IFC pretended to know enough about the project to be able to discuss it with Van Ham, and that she either was not informed correctly, or lied. Van Ham should have realized that Van Oldeniel was an interested party. She was not only responsible for the PPP, but also for the

¹⁴ The colorful invitation card can be found under 20051215 in the directory PPP.

¹⁵ One could only formally inform a DG, or anyone else outside his or her department, through the head of ones department. The head acknowledged his approval by a signature. Opportunities for informal information were rare.

¹⁶ His notes about the call are written on the memorandum under 20051118 in the PPP-directory.

¹⁷ She seems to have actually used these English words.

¹⁸ It was unwise of Van Ham to decide this of his own accord. He should have discussed it with Van Velsen and/or Dijkstra first. If only to be safe.

“Première”. Cancellation of the “Première” would mean loss of face. The memorandum of Van Velsen had shown Van Ham that the project ran out of its time-table, and that this was a result of other problems.

It was obvious that nobody would have reason to oppose a “Première” if the portals were reasonably useful. Like Van Velsen, Dijkstra didn’t like the idea of a “Première” if the portals were no more than empty shells, and if completion was a matter of believing against one’s better judgment. On the other hand, Dijkstra didn’t like to ask his head of department to go back on his decision to attend the “Première” either. Hoping that IFC had managed to substantially improve the portal since the test of (only) a fortnight ago, as it said it had, he asked some people of his section to do another test of the portal. If it was successful, he could tell his head of department that he could safely go to the “Première”.

The test was held in the afternoon of 30/11/05. IFC representative Fransen was present. The test was not only disappointing but shocking. For while everybody could see with his or her own eyes that the portal contained only very few of the promised tables, and frequently failed as a website, Fransen stubbornly maintained that this was what had been agreed upon.

The day after, Fransen sent Dijkstra a mail, concluding that apart from a few minor trifles, the portal was ready for acceptance. The mail made it seem as if the test had been very successful. Fransen asked Dijkstra to confirm that he agreed with his conclusions.¹⁹

Dijkstra asked Van Velsen to reply. The main points of the reply were the following:

- At present the portal contains only a small fraction of the data specified in the plans;
- The performance should be substantially improved. Basic information should be accessible to all users. The OLAP-technology²⁰ should therefore be the exception, not the rule;
- The required improvements are necessary to realize the goal of release 1, and should be realized within the agreed budget for release 1;
- A list of specified points for improvement will be sent shortly.

On 29/12/05 HE sent IFC a report of the test of October-November.²¹ IFC promised to solve some of the problems. Other problems were said to be unsolvable. IFC denied that it had been agreed that the portal should contain data per institution. HE considered these data of great importance. They were included in the prototype, and (implicitly) in the datasets listed in the appendices of the relevant plans. Because of the importance of these data, Van Velsen sent Fransen and the IFC project leader, Job van Weeren, a memorandum with a comprehensive justification of the assertion that the HE-portal should contain data per institution.²² They never replied.

In November it had become clear that the HE-portal was far from ready, and that IFC could not be trusted to fulfill its obligations of its own accord. Somehow pressure would have to be applied to IFC. That would be very difficult if the higher management of the ministry and IFC got the impression that the portals were virtually ready. Such an impression would make it difficult for the departments of HE and PAE to refuse acceptance of the portals, however useless they might be. On 10/11/05 Van Velsen therefore asked his IFC-contact to try and get the “Première” postponed. IFC refused. On 2/12/05 Van Oldeniel nevertheless mailed the persons invited that the “Première” had been postponed until January. The date was still to be fixed. A new invitation was to be sent as soon as possible. It never

¹⁹ Fransen should have sent his mail to Van Velsen, because Van Velsen was his contact for HE. Only if he thought Van Velsen did not function properly could he have gone directly to his head. In that case, he should have explained his problem. The behavior of Fransen was the rule rather than the exception for IFC. If somebody in the ministry would not accept an inadequate IFC-product, IFC shopped around until it had found somebody who accepted and didn’t make difficulties.

²⁰ OLAP is short for online analytical processing. This refers to software for getting useful information out of data which depend on many variables. Shortly: a tool for multiple choice information selection. Use of OLAP was cumbersome, and it took a lot of time before one got what one wanted.

²¹ In the directory PPP, under 20051229.

²² And which data precisely. In the PPP-directory, under 20060127.

came.²³ It follows that Van Oldeniel must have known of the difficulties with the PPP.

HE sold the skin of the bear before it had been caught. On 1/11/05 Wim Fliermans, the person responsible for university-information, had to leave the department. Fliermans had worked many years in the section of Dijkstra. He had built a well-working information system.²⁴ His position was said to have become redundant due to the transfer of the information production to IFC.

The system for the production and management of information about higher professional education had been organized differently.²⁵ It was embodied in html-pages, connected by links.²⁶ It had been built by Henk Rademaker. In 2005 he was working in the financial section. He spent at most a day per week on the maintenance of this information system. His other workdays were spent on financial matters. He was asked to end work on the information system, and accept some other, non-related, tasks instead.

Both systems could be used without difficulty by everyone in the department of HE. There were no complaints about them. It was obvious that they could have been improved and integrated at very low cost.²⁷

2006.

Every week the SG wrote a weblog for the intranetsite of the ministry.²⁸ His weblog of 22/1/06 included a remark that showed a serious lack of knowledge of the facts and of awareness of the risks of one-sided information. It could easily hamper the work of people having to do with IFC. Together with the uSG, the SG had attended a meeting organized for him by IFC in conference center “De Sniep”, behind its office building in Zoetermeer. According to the weblog, “this meeting will lead to an even better working IFC, even though this would seem hardly possible if you know how much they already did in the recent past.” Van Velsen was afraid that this and similar nonsense would make it very difficult to get a useful portal. The remark was the opposite of what was needed.

One could comment on the weblogs. The comments were visible for everybody in the ministry and its agencies. Van Velsen therefore decided to write one. The following is the essential part of it:

«It seems that IFC told you nice stories, and that you believed them. Your eulogies are unthinkable if you would have had yourself informed by your own organization. If you had done so, you would have heard that IFC systematically lies about the progress made with (for example?) the policy-portals.

Your people have to negotiate with IFC, and try to get IFC do what it promised and agreed to do. This is not particularly helped by a boss who writes that IFC is doing a fantastic job.

Therefore, I kindly and urgently request, that you let yourself be informed about the performance of IFC by the people from your own ministry who are working with IFC. I trust that this will result in a more careful judgment, which will stimulate ministry and IFC alike to do what they have to do.»

The SG reacted as follows:

«Thank you for your comment. Please call, I would say. In the past 2.5 years as SG I have never been told that something wasn't going as it should. I would very much like to get informed. So that I can do something about it.»

This was followed by a pleasant talk on 7/2/06, and by the following remarks in the weblog of 12/2/06:

«Sometimes the quality of services rendered by our colleagues in Zoetermeer is perceived differently by colleagues in The Hague. In my weblog of 22/1/06 I was rather positive about them, but that was not received with thanks by everybody. Some people commented very critically about IFC. On

²³ It may be a flattering thought that the cancellation of the “Première” was due to the lobbying of Van Velsen, but there is no positive evidence to support this hypothesis.

²⁴ Based on spreadsheets. Simple, versatile, and reliable. The pages were linked.

²⁵ Due to different organizational structures of the ministry in the past, and the lack of (need for) uniformity.

²⁶ Like a website, but accessible through a shared hard disk, and not through the worldwide web (internet).

²⁷ Say at most two years work by someone like Fliermans or Rademaker. Which means at most 0,15 M€.

²⁸ An intranetsite is an internal website of an organization.

the one hand this is regrettable, but on the other hand it informs me of facts which would otherwise remain hidden. So, if something goes wrong, let me know! Don't keep it for yourself, don't deny the problem. Speak up, then something can be done about it. Don't be afraid that it will be held against you, for that's not the way we work in this ministry.»

The sequel will show the value of these words. For now it suffices to note that the weblog does not acknowledge that something is actually wrong with IFC. It only notes a difference of opinion. Even though in the conversation of 7/2/06 Van Velsen had shown proof of the assertions in his reaction to the SG's weblog. He had given the SG the hyperlink to the portals. In a few minutes the SG could have seen for himself that the portals were fake. But in spite of the suggestive "So that I can do something about it" he did nothing.

On 14/3/06 there was to be a meeting of Van Ham, Dijkstra, Van Velsen and Van Oldeniel. It was to take place in pursuance of the request to postpone the "Première". Van Oldeniel defaulted without explanation. In her stead she sent Steven van Spijker, the head of the unit of IFC responsible for the portals.²⁹,³⁰ Van Spijker did as if there was no problem with the portals whatever, nor with the communication about them. He (therefore) gave no explanation of the delay and the bad shape of the portals. Neither did he give a new time-table. In fact, he hardly talked about the portals at all. Instead, he raised the roof about the reaction of Van Velsen to the weblog of the SG. Van Ham and Dijkstra defended Van Velsen. But they showed no concern about the delay of the project and about the unreliable communication.³¹ The only agreement reached in the meeting was a superfluous one, namely to pass on problems which the representatives couldn't solve to a higher management level.

IFC told the representatives of the education departments next to nothing about the internal design or structure of the portals.³² It only told them that a datawarehouse was to be the central part, and shared by all portals. IFC never gave trustworthy information about progress or problems. In due time most of what it told turned out to have been untrue. By means of green lights and smileys in progress reports it gave the impression of progress according to plan. In doing so it misled the top of the ministry.

For some time IFC sent the top of the ministry progress reports that the representatives of the education departments knew nothing about. These reports were sent every two months. They were meant to be input for the periodic bilateral consultations with DG's and/or uSG on the one hand, and the head and other top managers of IFC on the other. Initially, not even the fact of these consultations, their periodicity and participants, were known to the representatives of the education departments.³³ When they found out, they tried to change procedures in such a way that the top was informed correctly, and couldn't get the idea that it could remain idle when its intervention offered the only possibility for correction. The departmental representatives for example tried to see the progress reports and comment on them before they went to the DG's and uSG. This was not always possible, because IFC usually sent the reports to the ministry only a few days before the consultations. It did not send them to the representatives. The DG's and uSG complained, but took no effective action. Neither did they try to get understandable and useful information instead of irrelevant, unintelligible bla bla.³⁴

In December 2005 and January 2006 efforts were made to induce IFC to be more open and cooperative. On Thursday 12/1/06 Van Velsen had a talk with IFC project leader Job van Weeren. Especially about the communication. Van Velsen said he understood that the PPP was a complex project. He could easily imagine unexpected difficulties, and, as a consequence, delays. But as a representative of the financier-user he required an explanation. Including information about the design of the portal. So that he could understand the progress or lack thereof. Van Weeren always promised to change for the better. But he kept denying that the HE-portal should provide numbers per

²⁹ Without prior notice. Van Ham told Van Spijker he was surprised.

³⁰ Together, Van Oldeniel and Van Spijker formed the head-directorate of IFC.

³¹ Probably because they were used to this, or expected nothing else.

³² Neither at this point in time nor later.

³³ Nobody had told them, and it is described nowhere.

³⁴ An annotated report can be found in the subdirectory SU-reports of the PPP-directory, under 20060322.

institution. The progress reports changed in form, but never became reliable. The trickery³⁵ continued unabatedly.

Because of the attitude of IFC and that of the top of the ministry, it promised to become difficult for the education departments to get what they needed and paid for. It was to be feared that a lot of pressure would be exerted on them to accept a useless product. To defend non-acceptance, it would be useful to have an objective and professional evaluation of the portals. By a lucky chance, the department of information policy of the ministry (IP) turned out to have professional expertise for testing ICT-products. It would gladly help. In agreement with IFC (!) a test plan was drawn up. It provided for a basic and an extensive test. The main purpose of the basic test was to find out whether a full test was worth while.

The basic test took place 2/5/06, in the presence of Fransen.³⁶ The test showed a very incomplete and badly working portal. For example, the arrows for going to the preceding page, or forward to the next, rarely worked. Clicking an arrow often gave an empty white screen. A large part of the problems in the list of 29/12/05 had not been solved. The governmental directives for websites had not been implemented. The experts who found this were visibly shocked. They got the impression that the directives had not been consulted at all.

The results of the basic test were reported to the management of HE and IFC. IFC replied that it did not agree with the report. But not in writing, and it gave no arguments. The extensive test was cancelled. A new basic test would be held after elimination of the main defects.

In a meeting of the head of IFC with DG Renk Roborgh on 23/5/06, Van Oldeniel complained about HE. HE shouldn't make so much trouble. It should accept release 1.³⁷ In pursuance of this complaint, Roborgh organised a meeting of the people from HE and IFC who took part in the PPP. It was held on 28/6/06. Roborgh observed that IFC hadn't produced what it had promised. Could it be that the level of ambition had been too high? Did it have technical problems? IFC didn't reply. Roborgh requested IFC to be more open in its communication.

In 2006 most of the discussions HE-IFC had two subjects: the specification of the contents of the portal, and the solution of the problems in the list of 29/12/05. Progress was very slow. There was no credible time-table. There was only little discussion about the web-directives. Since it had become clear that IFC had difficulties with them, the representatives of the education departments made inquiries about the nature and importance of the directives. They found that most of them were conclusions everyone would draw who would think responsibly about building, using and maintaining a website before starting to build it. It was only natural that they had been included in the *Portal requirements*.

On 23/5/06 Fransen announced that on 1/07/06 the portals would comply with the "minimal set" of governmental web-directives. The remainder of the year would be devoted to implementation of the "optimal set".

In order to avoid asking the impossible and getting stuck in an unsolvable problem, Van Velsen proposed IFC on 14/7/06 to implement the minimal set in release 1, and the optimal set in release 2. In reply, IFC only said that it couldn't guarantee implementation of the optimal set.

In August IP found that the situation had slightly improved, but not substantially.

IFC never explained why no notice had been taken of the web-directives. Even though they were listed in the *Portal requirements*, and most of them could be derived independently by any expert. But the most remarkable fact is that all relevant IFC-people started to deny that the portals should comply

³⁵ Contrary to the code of conduct of the ministry.

³⁶ It concerned only the HE-portal. The other departments did it their way. Their information systems were said to be less extended and/or complicated.

³⁷ Although as a rule points of discussion (points for the agenda) were exchanged before the meeting, Van Oldeniel had not said that she wanted to talk about the portals. This meant that the DG was unprepared. Timely announcement of points for discussion was meant to enable the relevant officer(s) to inform and advise the DG. So this was just another trick.

with the web-directives.³⁸ There was no trace of a constructive attitude towards the directives and their implementation. No discussion, no compromise. Only denial.

From 2005 to mid-2006 progress and problems in the project were discussed in a working group consisting of the representatives of the education departments and IP, and people from IFC. It was chaired by IFC project leader Van Weeren. The secretary was from IFC as well. The meetings of the working group were useless or worse. IFC gave no or no reliable information about progress or problems, and almost never kept its promises. It regularly gave presentations. If none of the representatives of the ministry objected, IFC assumed that the ministry had agreed with the premises, proposals etcetera implied by the presentation. Without saying so.³⁹

The representatives of the ministry therefore developed a proposal for another way of organizing the communication ministry-IFC. The working group was to be replaced by a steering committee with a chairman and secretary from the ministry, a single representative of the four education departments, the IFC project leader, and another PPP-relevant IFC manager. The proposal was accepted by the DG responsible for the PPP, DGPS Rob Kerstens, (also) responsible for the departments of PE and SE. The chairman of the steering committee was Roel Endert, head of the policy section of HE. The secretary was Carry Beekink from IP.

The first meeting of the steering committee was on 19/6/06. It decided that its first job was to get an overview of the state of affairs, and a realistic plan for the remainder of the work on release 1. It asked the education departments to send copies of the plans, and the reports of their tests, to the steering committee. The reports of IFC however remained as obscure as always. The committee got no idea what they were doing. IFC refused to provide a time-table. It periodically promised the education departments to solve the remaining problems “in a few weeks”. But it never did. In other words: the steering committee didn’t get the information it needed to get a grip on the reality of the project.

The uSG and the two DGs responsible for the education departments⁴⁰ let the project drag on without taking any action towards IFC. They gave no sign of concern about the information of the education departments. The representatives of these departments had informed them of the delays and the state of affairs. The uSG and DGs could know that the IFC-progress reports were incorrect and misleading. In June DG Kerstens had replaced the dysfunctional working group by a properly composed steering committee. Not on his own initiative or that of the management, but on that of the representatives. On 28/6/06, when Roborgh fatherly admonished IFC, the delay was half a year, and completion a chimera. The meeting of 28/6/06 reduced the pressure on HE to accept a useless portal. But none of these minimal actions affected the behavior of IFC.

According to the progress reports, the budget for the PPP would be spent by 31/8/06. It was clear however that the work on PPP would not have been completed by then. The money had to come from somewhere, and at the cost of other work. Van Velsen therefore asked IFC to tell the ministry what other budgets it was going to charge for this purpose. Moreover, he asked IFC to give an account of the way the budget of over 4 M€ had been spent.⁴¹ That is: on what activities, products and whatever. Not in the last place because such an account might shed some light on the design of the PP. IFC did not answer these questions. It only told the ministry that no additional bill would be sent.

In October IFC sent a report to uSG about the progress made in May-August.⁴² The following gives an impression of the way in which IFC “informed” the top of the ministry about the progress of the PPP:

³⁸ In chronological order for example Maurice Fransen, Jacques Schellingerhout and Annemiek Scholten.

³⁹ It took some time before the representatives understood that they were being tricked. Not they, but other people were told that this or that had been “approved by the ministry”.

⁴⁰ The DG of PE and SE, DGPS Rob Kerstens, was the representative of uSG for the PPP.

⁴¹ HE had paid half of its part, having promised to pay the other half upon acceptance of the portal. IFC had agreed with this procedure. Due to trickery (probably cheating) by Willem Schutte of IFC, part of the other half was paid during the summer vacation of 2006. K€ 113 remained to be paid.

⁴² The progress report can be found in the PPP-directory, under 20061004.

- The report said that SE and PAE had accepted their portals. This was untrue;
- Under the heading “What went well”, it mentions the communication about the PPP between ministry and IFC. Which is obvious nonsense;
- The PPP is not mentioned in the tables “Matters for improvement” and “Points of concern”;
- “The project proceeds according to plan.” No mention is made of any delay;
- A steering committee has been installed to organize the solution of remaining problems and to manage the expectations of HE. Suggesting that one should not expect agreements to mean what they say;
- Under the heading “Finances” the report states: “Realization within budget”. The preceding paragraph shows that this is untrue;
- Under the heading “How it feels” the project scores a 7 (out of 10). This is the highest mark given in the list.⁴³

The reader cannot help doubting the reliability of the reports about the other projects. The progress report was meant for a meeting of uSG with the head of IFC. According to the notes of this meeting, uSG expressed concern about the progress and financial risks. She asked whether the head of IFC is in control. The head of IFC replied: “Yes, I am. The PPP is going better since the steering committee began its work”. The DGs said they had heard otherwise. The head of IFC promised to check.

That was all.⁴⁴ Nothing has been heard of the checking by the head of IFC.

Due to the efforts of the representatives of the education departments the progress reports have changed in the course of time. But it would be too kind to call the changes improvements. The consequence of the “quality” of the progress reports and other communication of IFC was that nobody in the ministry had a credible idea of what was going on in IFC.

In the autumn of 2006 several of the IFC-people working on the PPP were replaced. Maurice Fransen was replaced by Dick Ravestein. Communication seemed to improve,⁴⁵ and Ravestein added a lot of tables to the HE portal. But the replacements solved no major problem. Nothing was done about the design or the datawarehouse and many other essential elements of the PP.

On 6/12/06 IFC organized a “learning-points meeting” for the representatives of the ministry and some of the IFC-people working on the project. The meeting was chaired by an external consultant, hired and informed by IFC. One of the IFC-people, Annemiek Scholten, wrote a report of the meeting.⁴⁶ She concluded that the representatives of the ministry were unanimous in their judgment that IFC cannot be trusted, neither with regard to technical abilities nor with regard to integrity and the ability to cooperate:

«It was said and not contradicted that:

- IFC systematically doesn’t do what it has agreed to;
- Progress reports were and are incorrect and misleading;
- The quality of some of the portal-products is evidently insufficient.»

By the end of 2006 the two IFC-members of the steering committee were replaced by Jacques Schellingerhout and Esha van der Hulst. Schellingerhout was responsible for a group of projects, including the PPP. His hierarchical position was directly under the head of IFC. The position of Van der Hulst was titled “manager information products”.

⁴³ Note that the comparatively positive mark is consistent with the findings of the next chapter.

⁴⁴ The most relevant (?) section of the notes can be found in the PPP-directory, under 20061016. When asked for the notes, the assistant of uSG only sent this part. It is therefore unclear whether this is all that is relevant for the PPP.

⁴⁵ “Seemed”: appearances improved, and Ravestein may have been well-intentioned, but wasn’t open and reliable.

⁴⁶ It can be found in the PPP-directory, under 20070307. The intention had been that the external consultant would write the minutes. They were written, and commented upon by the participants of the meeting, but said to be lost as a result of the consultant’s departure to another firm. Scholten tried to save and integrate as much as possible of the several contributions.

2007.

As long as there was no substantial improvement in the attitude of IFC, the representatives of the education departments considered talks and new agreements with IFC of little use. The foremost question therefore was: how can IFC win back the confidence of OCW? Somehow a break with the past and a new beginning had to be made. Van Velsen thought IFC could make a new beginning by:

- Ending the pressure on the education departments to accept the portals;
- Giving insight in:
 - The internal structure of the portal;
 - The organization of the work on the project;
 - The way quality is ensured;
- Giving an account and/or evaluation of the work on the portals in 2005 and 2006;
- Explaining why reasonable expectations were not realized;
- Giving a financial account;
- Substantial improvement of the progress reports.

In sum: by much more openness. The replacement of the two main PPP managers seemed to offer an opportunity. Van Velsen requested a meeting with them, to get acquainted and to discuss the situation. The meeting took place on 30/1/07 in the IFC building in Zoetermeer. Schellingerhout and Van der Hulst listened, but did not comment, and promised nothing.

The first four months of 2007 brought no improvement. The new IFC-people behaved just like their predecessors. Van der Hulst put pressure on the departments to accept the portals, and Schellingerhout claimed that IFC needed to implement only a small part of the web-directives. Probably he allowed himself to be informed by people responsible for ignoring them. But he had been warned, and could easily have checked the *Portal requirements* document himself.⁴⁷

For the several decision-making processes related to the project, it seemed wise to have a reliable picture of the current state of the HE-portal. IFC said it had done a lot of work on the portal since the test of May 2006, but it was not clear what worked and what not, and what information the portal contained.⁴⁸ Van Velsen therefore organized a “snapshot” of the portal. Actually it was a test, but it was called “snapshot” in order to prevent bureau-political problems. Like the test of 2006, this one was supported by experts from IP. The basic test was done 15/2/07, in the presence of Dick Ravestein and his colleague Mia Looyestijn. The test showed problems, but not enough to preclude an extensive test.

The extensive test was done by 25 people from HE. They were informed in a meeting with presentations by an expert from IP, by Ravestein and by Van Velsen. They got written instructions and a questionnaire. They could do the testing anywhere in the period of 16/2-15/3/07. The observations of the participants were collected in a spreadsheet. The conclusion was that much information had been added, that definitions and explanations leave much to be desired, that it is hard to check the numbers, and that the portal is very slow. For the last reason the OLAP tool (the instrument for multiple choice information selection) was almost useless. This is important, because most information had to be accessed by the OLAP tool.

IFC said that it welcomed the results. But it wanted to transfer the solution of some elementary problems to release 2. HE didn't agree. It was afraid that postponement would be followed by further postponement (as usual with IFC). HE therefore required problems of release 1 to be solved in release 1.

The delay, the test results, and the lack of explanations made it risky or irresponsible to trust the ICT-system behind the portals. The ministry would furthermore like to know to what extent IFC had implemented the web-directives. If only to check everything that could be checked. In more detail than

⁴⁷ Note that this and other chapters of this report show many cases of “managers” refusing to make simple checks that would completely resolve a question.

⁴⁸ IFC never produced overviews or global descriptions of the state of the portals.

IP could, and preferably measured by an accredited firm. Such a firm was found and hired: Accessibility. In April 2007 it found that 24,8% of the directives is not applicable, that 30,4 % is implemented, and 44,8% is not implemented. The scores were especially bad for the directives for building and structure.⁴⁹ An important practical conclusion was, that rebuilding was probably cheaper than adjustment.

In the discussion about the results of the investigation, IFC asserted that OLAP is inconsistent with the web-directives. If this were true, it would have far reaching consequences. Therefore it had to be double checked. If true, it would be necessary or advisable to look for alternatives.

In a sense, the findings of Accessibility were the death-blow for the project. The findings confirmed what the ministry had feared all the time, but couldn't check: that not only the front of the portals was defective- what the user sees-, but the inside even more. The findings had a great impact on the thinking of the ministry about the project and IFC.

In February 2007 the chairman of the steering committee asked IFC to submit drafts of a Discharge protocol (DP) and a Service level agreement (SLA). The DP was meant as a conclusion of release 1. It should show that the past could be left alone, and that the ministry could trust IFC to solve the remaining problems. For these reasons, the DP would include the points 2-5 mentioned above.⁵⁰ The drafts were to be submitted 31/3/07 at the latest.

They were received 11/4/07. They were grossly inadequate. The following examples refer to the DP. Section 3 said that the documentation had been fully updated. Actually, documentation on paper was nonexistent, and the documentation in the portal was scarce and defective. Another paragraph claims that all relevant tests and reviews had been done, and all corrections made. Some IFC-internal tests are mentioned explicitly. They were unknown in the ministry. Audit 3, to be discussed later, found that the reports of the tests had been lost.

Section 7 claims that release 1 satisfied the performance requirements. Without proof, and plainly untrue. No insight is given in the design of the portals and the work done. There is no financial account. The DP asserts that 4,765 M€ was spent on the PPP. But it doesn't specify, for example, how much was spent on the datawarehouse.

In sum: the draft showed that IFC could not be trusted at all.

On 14/5/07 the chairman of the steering committee sent the comments of the education departments to Van der Hulst. With the request to react 15/6/07 at the latest.

By the end of May, deputy head Van Spijker of IFC tried to force an end to the discussion about the Discharge protocol. On 14/5/07, without consulting or informing the steering committee, he sent a mail to Kerstens, the representative of uSG for the PPP. The mail said that the brains of the PP are formed by a datawarehouse, and that this datawarehouse is working well. The mail proposed that the chairman of the steering committee, Van der Hulst and Van Spijker analyze the comments of the education departments, and try to concentrate the discussion on a few main lines. «*Then the three of us start discussions with the departments, hoping to get agreement. If we don't succeed or only partially, which I'm afraid of, we write a memorandum with points to be decided by you.*»⁵¹

The assertion about the datawarehouse was not substantiated. For the ministry, the datawarehouse has always remained a black box. Or rather a black hole, for it devoured millions of euros without letting escape a single ray of light. And the sequel will show that it didn't work properly at all. In other words: that Van Spijker lied.⁵²

The chairman of the steering committee and the education departments shuttled the proposal, and prevented that Van Spijker took over the management of the discussion from the steering committee and/or its chairman.

June 2007 stood in the sign of:

⁴⁹ The Accessibility report is in the PPP-directory, under 20070410.

⁵⁰ "Giving insight in" etc.

⁵¹ Paraphrased. The Dutch version of this report gives a quotation. The original mail is in a file with the correspondence about the PPP of 2007.

⁵² He knew that he could safely do so, since the ministry couldn't check his assertions.

- The adapted DP;
- The reaction of IFC on the report of Accessibility about compliance with the web-directives;
- The formulation of a memorandum of the heads of the four education departments to DGPS;

And to a lesser extent:

- The findings of the “snapshot” (test) of March.

The memorandum of the heads of department was a consequence of the loss of belief that continuation of the discussion with IFC would yield useful results, and the wish to make this known to DGPS. Not only informally, but also in writing. To elicit appropriate action. Because of the half-hearted adaptation of the DP, the unsatisfactory reaction to the Accessibility-report, and IFC’s failure to solve many even old problems of the portals, the education departments no longer believed that IFC would learn the lessons of the learning points meeting of December 2006. They were convinced that only action by the top of the ministry could bring about the necessary change in IFC’s ways.

Communication with DGPS Kerstens about the PPP was infrequent and irregular. Up to this point in time, he had only played a passive role: he had approved the appointment of a steering committee. The steering committee had turned out to be unable to set matters straight. Its chairman admitted that he had underestimated the problem. After a year, experience made him adopt the views of the representatives of the education departments. On 5/7/07 he discussed the situation with Kerstens. He announced the memorandum, and sketched its contents. Important sentences in the memorandum are:

- The portal is at least 1.5 years behind the schedule;
- It doesn’t comply with the agreed specifications and requirements;
- The project has seriously reduced trust in the management and technical abilities of IFC;
- Continuation of the project by IFC seems meaningful only after proof of the necessary abilities of IFC.

The memorandum asks DGPS to approve the following recommendations:

- Do not accept the portals;
- Let an independent competent party answer the question whether OLAPs and web-directives can be combined, and at what cost;
- Let an appropriate committee advise about acceptance of the datawarehouse;
- Improve the organization of the management of IFC by the ministry.

Kerstens agreed. He promised to defend these opinions and recommendations in his next periodic meeting with IFC. The promise gave chairman Endert of the steering committee hope. He told the representatives: there is light at the end of the tunnel.

The meeting with IFC took place 17/7/07. The participants were: Kerstens, Endert, Van Spijker and Van der Hulst. In his introduction Kerstens said that he wanted to talk at least about the quality of the portal and the damaged trust. IFC continued with a presentation about the results of the project up till then, and a proposal for continuation. The presentation suggested that although a few things remained to be done, IFC had not received complaints about the functionality. IFC had delivered a good product. It was being actively used. Van Spijker said that an audit of an internal reorganization of IFC had concluded that users in the ministry found the portal satisfactory. Formal acceptance was not very important for IFC, but it did want to get paid the remainder of the budget.

Endert said that he didn’t understand where a positive judgment could have come from. Kerstens cited the negative judgment in the memorandum. He asked Endert to provide proof of the inadequacy of the portal.⁵³ Endert promised examples. He elucidated the memorandum. He said that in his opinion work on release 2 should not start⁵⁴ before release 1 had been accepted. He proposed to evaluate the datawarehouse separately.

Kerstens spoke as if he were a mediator instead of representative of the customer. He seemed to see only two quarrelling, equivalent parties. He showed no interest in the project agreement and the

⁵³ Again: Kerstens could and should have taken a look himself.

⁵⁴ And money promised!

product. And he seemed to be biased too. He requested Endert to substantiate his assertions, not Van Spijker.

During the meeting, Van der Hulst said that the requirement about the web-directives had not been put in writing. When Endert sent her the *Portal requirements*, she replied: "Shall we have a talk after my vacation?".

Kerstens got his examples. But did nothing.

The audit mentioned by Van Spijker had been held by Ed Smid of the audit department. The report of this audit was not known in the ministry. Furthermore, an inquiry taught that nobody from the education departments had given a (positive) evaluation of a portal. Van Velsen therefore asked Smid for the source of the evaluation. Smid confirmed that it didn't come from the departments (the only users). It came from Van Spijker. It follows that Van Spijker had lied to Smid. Moreover, the suggestion in the meeting of 17/7/07 that it was the conclusion of an inquiry by an independent auditor was deceptive. The auditor had simply copied the assertion of an interested party without checking.

A few months earlier, Van Velsen had informed Smid about the problems surrounding the PPP.⁵⁵ He had advised Smid to check whatever IFC asserted. What every professional auditor should do anyway. Notwithstanding methodological requirements and this warning, "auditor" Smid had decided to believe Van Spijker at face value.

After a lot of minor difficulties, a bureau, VKA, was selected for the investigation of the compatibility of OLAP and web-directives. It should answer the following questions (abridged):

- Is it possible to build an OLAP tool which complies with the web-directives?
- If so, what would be the cost and time needed for realization?
- In not, what alternatives are available, and what are their main characteristics?
- If only partially, which web-directives can be ignored from the points of view of accessibility and durability?⁵⁶

Even though VKA had formally agreed to answer these questions, it took a lot of pressure to get it done. This applies especially to the third and fourth questions, and to questions about costs. Another remarkable observation is that VKA let itself be guided by the information it got from IFC and from persons mentioned by IFC. Even though VKA had been warned by the ministry that there were serious communication problems. The attitude of VKA made it difficult for the ministry to know to what extent VKA's results were reliable, or colored by IFC. The failure to mention alternatives as requested by the third question could reflect the thinking (or absence thereof) of IFC, or lack of knowledge, creativity and/or time of VKA.

The final report contains concise reports of consultations of the four education departments. They give evaluations of the portals and project. They contradict the "finding" of the audit of the reorganization of IFC quoted by Van Spijker in the meeting of 17/7/07.

The final report of VKA is dated 17/12/07.⁵⁷

On 15/12/07 Kerstens was appointed quartermaster for the fusion of IFC and the Information Administration Group (IAG), the other agency of the ministry of education. He was also made responsible for the information policy of the ministry. He was no longer responsible for the departments of PE and SE.

Before moving on to 2008, mention should be made of a development that started as a consequence of the PPP, but evolved rather independently.

We saw that in June the representatives of the education departments had concluded that the behavior of IFC in the PPP would not improve of its own accord. They saw no other solution than appealing to uSG and their DG's. But as shown for example by the failed attempts to get the progress

⁵⁵ In an accidental meeting. Van Velsen and Smid knew one another from the past.

⁵⁶ The unabridged questions can be found in the report of VKA, under 20071221 in the PPP-directory.

⁵⁷ It can be found in the PPP-directory, under 20071221.

reports improved through these same channels, success was far from guaranteed.⁵⁸ Apart from this, Van Velsen felt that the way his colleagues and he himself were mistreated by IFC representatives, and, to a lesser extent, by uSG and the education DG's, was shameful and unacceptable. He didn't understand why they had to accept behavior that is clearly incompatible with the code of conduct of the ministry. The code says: «Our behavior with respect to each other and to the outside world should be open, service-oriented, respectful, impartial, and reliable.» In fact, he felt the misconduct to be the most important problem of this project. The utterly dishonest behavior of all IFC people made the work most unpleasant and nearly impossible. IFC seemed to consider integrity as a superfluous luxury instead of necessary for cooperation.

Having tried to find out how the code could be used to realize improvement, and after consulting Endert, Van Velsen decided to contact an integrity officer, and ask advice. In the course of the project he had seen that really everybody was afraid of the consequences of speaking out openly. Even though logically speaking the problems in the PPP could impossibly be limited to the PPP, the annual reports of the integrity officers gave no sign of systematic violation of the code. For this reason, Van Velsen chose an integrity officer working in another ministry.

Endert, the integrity officer and Van Velsen saw two alternatives:

- 1) Submit a formal complaint through an integrity officer;
- 2) Appeal to the SG to take appropriate action.

It was expected that the first alternative would evoke a defensive, denying attitude, and not produce anything positive. Therefore, and because the SG regularly presented himself as a champion of integrity, and to give the ministry an opportunity to correct itself, Van Velsen adopted the second alternative.

He requested and got an appointment with the SG. On 11/10/07 he told the SG that his colleagues and he wanted to work and be treated in a normal way, with mutual respect, in agreement with the code of conduct of the ministry. IFC violated the code systematically. He appealed to the SG to maintain and enforce the code. Van Velsen had chosen the defective and misleading reports as the most important and provable example. After all, reliable reports are crucial for management. He had brought a few examples, and the main plans, in order to show evident contradictions.

SG listened patiently, and seemed to take things seriously. But he wanted confirmation. Which was provided by Endert on 7/11/07. Among other things, Endert said that IFC was very good at making promises, but very bad at keeping them. He saw three problems: IFC, a ministry unable to deal with the problem IFC, and the fact that the problems are not reported. SG suggested talking with IFC. Endert and Van Velsen thought that would be useless. SG decided to order an audit, a quick scan.

The audit was done by Robert Pijl and Kees van der Putten of the audit department of the ministry. They based their report on documents and interviews. Endert, Van Velsen and other people commented on a draft. The final report was given to the SG on 4/12/07.⁵⁹ The conclusions were soft. According to the auditors, a more thorough inquiry would lead to “a further break in the cooperation” with IFC.⁶⁰ On 13/12/07 the SG personally gave Endert and Van Velsen copies of the report. He proposed that uSG, using this report, would start a series of talks with DGPS and the head of IFC, to solve the confidence crisis. He invited Endert and Van Velsen to send him their comments, if desired.

Endert and Van Velsen were amazed by the report. They concluded that it was faulty, and unsuitable as a basis for useful talks with IFC. They contested the assertion that a more thorough inquiry was impossible without hurting the relation ministry-IFC. They took it amiss that the auditors had refused to evaluate the progress reports. They therefore proposed the SG to order an audit specified as follows:

- Collect the progress reports, and order and evaluate them;
- Answer the following questions:
 - Do the progress reports give a correct and useful picture of the state of affairs in so far as relevant for management purposes?

⁵⁸ DG's and uSG had been informed about the untruths in the reports and about the misleading presentation of nearly everything, but had taken no or no effective action to improve the reports.

⁵⁹ In the PPP-directory under 20071204.

⁶⁰ Of course a rather curious and significant remark.

- Are they open, user-oriented, and reliable?

2008.

In reply, the SG told Endert and Van Velsen that he had requested Diana van der Stelt to perform a supplementary audit in agreement with their proposal.⁶¹ Van der Stelt was the acting head of the audit department.

Henceforth this audit will be called audit 2.

In the meantime the project continued as before. The top did nothing that promised improvement. There was no sign of appropriate communication within the top. In agreement with Endert, and in an attempt to get things moving, Van Velsen mailed the SG some questions and information.⁶² He asked when the report of audit 2 could be expected. He noted that the decision making about the documents *Information policy education 2008-2010* and *Information plan 2008* completely ignored any problem. The documents assumed that IFC was competent and reliable, and that the communication ministry-IFC left nothing to be desired. According to Van Velsen it was most unwise to proceed without a thorough evaluation. He wrote the SG that Endert, his colleagues and he himself tried to do everything possible. He gave information about their actions. He pointed out that the discussions might be helped by an audit report.

The SG sent the mail to Van der Stelt, who didn't reply. On behalf of her audit she interviewed Endert and Van Velsen 8/2/08. She didn't know when her audit would be completed. In reply to a later mail she said that she hoped to complete the audit in a few days.

Only 29/4/08 did the SG inform them about the report. He didn't give them a copy. He only read out what he said to be the most important conclusions. They confirmed the assertions of Endert and Van Velsen, with one exception. According to the report there was no malicious intent.⁶³ Still, the report confirmed corrupt practices and customs, and said that Endert and Van Velsen deserved thanks for reporting them. Which SG told them he took note of.

As far as known to the present author, the report of audit 2 has always been kept secret.

The above was known only to the participants. We now return to the mainstream.

An *Information plan 2008* was being written by Marianne Bos of IP and Paul Kuyt of IFC.⁶⁴ The plan said things about the continuation of the PPP too. But there had been no communication about the text with any of the education departments or the steering committee of the PPP. They hadn't even heard about the plan. In other words: IP was talking with IFC about the PPP without consulting any participant from the side of the ministry.

When the education departments found out, they contacted Bos, and arranged a meeting of Bos, Christianne Mattijssen (head of the section of IP responsible for the plan),⁶⁵ Endert and Ron van der Meer (head of the financial section of HE). The meeting took place 17/1/08. At the request of Endert and Van der Meer IFC was not invited. Endert argued that a plan as proposed is only meaningful after the solution of a number of problems. To wit. The ministry should know how to manage IFC; it should organise its vertical and horizontal communication properly; and it should have agreement about the defects of IFC. He said that these basic requirements were elaborated in an advice for the uSG which he was writing together with the education departments.

Mattijssen said that the information plan was being written at the request of Kerstens and IP. In preparation for the plan, IP had asked IFC what it can and cannot do. The actions proposed in the plan are meant to solve existing problems. For that reason, IP welcomed the proposals of Endert. The proposals seemed to offer good opportunities for getting a better hold on IFC. Endert couldn't understand why IP had asked IFC about its possibilities, while it knew about the problems, and also knew that the education departments were working on a joint proposal. He saw this as an example of

⁶¹ On 13/1/08.

⁶² The mail is dated 24/1/08. In the Dutch version of this report the mail is quoted in full.

⁶³ This is incompatible with for example the untruths in the progress reports.

⁶⁴ Kuyt also had a management function in the PPP. See the document under 20050201.

⁶⁵ The secretary of the steering committee came from another section of IP.

defective internal communication in the ministry. It undermines the confidence of the education departments in the successful conclusion of the PPP. Bos admitted that it could have been done better.

IP promised to integrate the remarks made in the discussion in the plan. Endert would promote synergy of the joint advice with the plan. Endert and Van der Meer would get an opportunity to comment on the revised plan before it was forwarded.

Endert and Van der Meer received the adjusted plan on 21/1/08. It was to be sent to the meeting of the Central Committee Information Policy Education (CCIE) of 29/1/08.⁶⁶ The document was entitled: *Note for decision making about production and accessibility of IFC information*. In his comment of 25/1/08 Endert expressed surprise about the title. He thought that it had been agreed on 17/1/08 that the CCIE would discuss, not decide. Too many points have to be thought out more thoroughly. The proposals on page 1 of the note don't match the main text.⁶⁷ Furthermore, the remark that the plans have been discussed with the departments suggests that they agree, which is untrue. I would say: "they have been discussed with the departments, who still have many questions".

In reaction, Mattijssen wrote a long mail, but gave no answers. However, close reading of her mail shows that Endert was right. But it was worse than Endert thought. For the CCIE meeting was not devoted to the information plan, but to "Getting production in order". This concerned the solution of specific problems, related to the datawarehouse. What problems was unclear however, for the relevant document excelled in vagueness.⁶⁸ Anyway, Endert and Van der Meer had not been informed about this.

The management of IFC by the ministry, that is: by uSG and the DG's, seemed to consist of nothing more than allowing IFC to blunder on independently and indefinitely, and providing it with all the money it asked, without bothering about results. However, in the light of what had happened in the PPP, Van Velsen felt stung, cheated, by this "Getting production in order". Because of the vagueness of the relevant document he suspected that this project was meant to repair and cover-up untold failures. Probably failures related to the PPP. He decided to write a mail to uSG, to inform her and to elicit action, but also to deprive her of the possibility to wash her hands in innocence.⁶⁹ The mail explains that the situation, and many (in)actions of both IFC and the top of the ministry, are indefensible. It shows contradictions in words and deeds. It notes that a few years ago, IFC proposed a number of separate portals. Now it proposes a fusion of some of them (at a cost, of course). The rules for project management, prescribed by the uSG herself, are completely ignored. The mail notes that there are periodic progress reports covering all current activities. They never report serious trouble. Why then suddenly this need of "Getting production in order", as if something isn't? And why the need to hurry? Why was the problem submitted to the CCIE and not to the periodic bilateral consultations of the top of the ministry and the top of IFC?⁷⁰

The mail can be summarized in the following three statements:

- As regards information products, IFC listens too little to the education departments;
- With regard to everything related to IFC, IFC manages the ministry instead of the other way around;
- IFC doesn't account for its activities; for the ministry it is a black box.

uSG replied that she and her assistant, Michaela Schouten- van den Boom, would think about it. The results of this thinking are unknown.

There are no formal minutes or conclusions of the meeting of the CCIE of 29/1/08. The DG of HE was represented by Erik Martijnse of HE. Martijnse wrote a concise report about the meeting. With

⁶⁶ The CCIE was a consultative body. Formally at least it couldn't take binding decisions. In practice it did. It was composed of high "managers", on the level of DG. With the exception of the head of IP and possibly others. It was presided by Kerstens. It was a tool of IP, used to circumvent or avoid normal procedures.

⁶⁷ A far too common trick. The implicit suggestion that the proposals (or conclusions or whatever) are based on argumentation in what follows is simply untrue.

⁶⁸ And yes indeed, everybody present accepts that, nobody wants to know what this is all about.

⁶⁹ Remember that the SG had said that «In the past 2.5 years as SG I have never been told that something wasn't going as it should.»

⁷⁰ There was no sign of any form of coordination.

respect to “Getting production in order” he noted that much was unclear, including the costs. IFC will talk with the departments “to get things clear”. HE never got things clear. In spite of its promise, IFC didn’t call on HE.

In the projects report of February 2008 for the periodic top consultations ministry-IFC, IFC wrote that it was giving the highest priority to getting production in order, and that this priority had been approved by the CCIPE. It said that in the information plan which was being written at the request of Kerstens, it made a proposal for wrapping up and continuing the PPP. The proposal is: integrate the portals,⁷¹ and build a separate system for more detailed information. In other words: IFC ignored the PPP steering committee and the proposals of the education departments, and abused these periodic top consultations to get its way.⁷²

Don’t forget that the datawarehouse (“production”) should have been completed (and operating) in March 2006. The state of the datawarehouse was as clear as mud. The question why IFC would be able to do in 2008 what it couldn’t do in 2005 or 2006 had been asked in Van Velsen’s recent mail to the uSG, but had not been answered.

The work on an advice for the uSG by Endert and the education representatives was laborious. It was difficult to make credible recommendations without offending the management. In addition, the information requirements and situation of the education departments differed substantially. HE suffered most from the failure of the PPP; PE said it could manage easily.

Early versions of the memorandum tried to discuss the organization of matters which are related to IFC in the ministry, and the management of IFC by the ministry. Nothing of this got unanimous consent.⁷³ Only three out of the four education departments thought that solution was impossible without changes in the areas of organization and management. The consequence was that the final memorandum considered hardly more than technical questions. But not all teeth had been pulled. uSG was asked:

- Not to accept the PP;
- To request keeping the present portal up to date and working until an alternative is realized;
- To answer the question “which table in which portal?” in connection with the portal fusion, and not in connection with the PPP;
- To allow the education departments to put out the production of an application for the consultation of multi dimensional data to public tender.

Refusal to accept also meant: no payment (of the remainder).

The fourth point meant abandoning the truck-system. That is: the obligation to let IFC, and/or IAG, the other agency of the education ministry, do every job that had to be done in the field of ICT for the ministry. Which was a matter of principle, and thought to be almost impossible.⁷⁴

11/2/08 was the date of one of the periodic meetings of the top of the ministry with the top of IFC. The draft-minutes of the meeting were distributed 4/4/08. They contain the following remark: «[In the opinion of DGNEA⁷⁵ \[=Kerstens\]](#) [this is the right time to deal with the troubled relation between IFC and HE, whereby the past is to be left alone. Action: AM \[= Agency management\] organizes a session with DGHPS⁷⁶ \[= Roborgh; who was absent\] and IFC.](#)» The “session” has not taken place. Probably because the memorandum of the four heads of the education departments put the “troubled relation” in perspective. All of them had problems with IFC. Note that Kerstens was well-informed, and

⁷¹ That is: the policy portals with at least two other kinds or groups of portals.

⁷² The projects reports were too late for comment by the education departments.

⁷³ Please note: majority rule was considered unacceptable.

⁷⁴ This impossibility was “public opinion” in the ministry. It was based on a yearly agreement ministry-IFC, the so called performance contract (PC). See p. 18 of the pdf-file 20080307_PC2008 in the directory Project and agency management. The important thing to note is that the PC was changeable. Moreover, it could not be so all-embracing as thought or suggested, for it is obvious that IFC cannot be asked to do what it cannot. After evaluation of years of failures, the article in the PC could and should have been dropped.

⁷⁵ The DG of the new education agency. Please remember: What’s in a name?

⁷⁶ The DG of HE, PAE, science, and emancipation.

nevertheless proposed no action but more talking.

The next of the periodic meetings was on 14/4/08. Among other things, it would discuss the projects report January-February 2008. As was the custom, the departmental representatives were asked for their comments. In reply, the representative of SE, Jaap de Hoog, mailed 7/4/08 to Schouten:

«If I look at the progress and problems of projects I see inconsistencies. In section 2.1.15 on the PPP the report says that the datawarehouse doesn't work as it should. IFC gives the highest priority to the solution of this problem. This is the same datawarehouse that is used in project 2.1.10, Education flows. The datawarehouse is mentioned, but not the problems. Project 2.1.9, Early school-leavers, also uses the same datawarehouse, but this isn't mentioned. According to me, IFC should tell us what is wrong with the datawarehouse, and what are the consequences of the problems for the projects which depend on it. [...] IFC should tell us which data have been included in the datawarehouse. »⁷⁷

Van Velsen subscribed to these remarks in a mail to Schouten of 9/4/08. Both De Hoog and Van Velsen had more questions. Nothing was done with them. They got no answers.

Until at least mid-2010 it would remain unknown what was wrong with the datawarehouse. Even though at that time a new project "Datawarehouse" had begun, with new money. We shall return to this later on.

One of the ways people try to show that they don't need to act, is by denying or belittling the problem that has to be solved. On 23/4/08 the memorandum of the heads of the education departments was discussed by the uSG, DGHPSE, DGNEA, Endert and Schouten. In the minutes of the meeting Schouten writes that "the portals do not comply for 100% with the requirements". The most important decision was to request a third audit. At short notice there would be a meeting with Van Spijker and Frank van Loon of IFC in which these gentlemen would be able to admit errors without fear for repercussions. The minutes don't ask them to explain why they lied systematically about the progress, and why henceforth the education departments could trust them.

The meeting took place on 13/5/08. Present were the uSG, DGHPSE, DGNEA, Endert and Schouten, Van Spijker and Van Loon. Later the same day, Endert wrote a concise report of the meeting. The report distinguishes past, future and present. The main points under "The past" are the following:

- uSG said that the portal doesn't comply with the requirements, that communication had been inadequate, and that the management of IFC by the ministry hadn't been clear;
- Van Spijker said that the problem was wider. IFC not only had to build portals, but first of all a datawarehouse. There are problems with the datawarehouse, and with the organization of IFC. These are being solved;
- Van Loon said that communication was difficult because of its technical character;
- Endert pointed out that the education departments need correct and timely policy information. IFC had always said that the datawarehouse was in order. Therefore the education departments concentrated themselves on the portals. In their eyes, the communication is more of a problem than the product;
- Kerstens wants clarity about the technical problems. It is not only communication, but primarily the question: is the datawarehouse in order, can IFC tackle big projects?⁷⁸ Therefore he wouldn't restrict the audit to the PPP;
- Roborgh noted that in projects such as this, difficulties are unavoidable. That need not be a problem, if the communication about them is honest and open.

There was a heated discussion about the portal being sufficient or not. Van Spijker said that a red plane had been delivered instead of a blue one.^{79, 80} Endert and uSG said that the plane didn't fly. It was decided that the product was insufficient, but that a line would be drawn under the past.

⁷⁷ Abridged. Italics of the original. For the full quote please see the Dutch version of this report.

⁷⁸ Note that he very well knew that the datawarehouse was not in order. It will turn out that he also knew that IFC could not properly do similar projects. If it could do them at all, then certainly not efficiently and effectively.

⁷⁹ Van Spijker actually compared with a car instead of a plane. In English a plane is more convenient.

⁸⁰ How could that be if there were serious problems with the datawarehouse?

The main points under “The future” are:

- uSG wants an audit to see if IFC can make this type of product. If not, why not. She wants the audit department of the ministry to do this audit;
- She asks whether the policy portal should be put out to public tender. IFC replied that it did so itself. And that IFC wanted to remain involved;
- It was decided that the main question for the audit would be: can IFC build a dataware-house, portals and similar products, and is it properly organized for such a job. But it should also look at the organization of the ministry with respect to its management of IFC as an agency;
- The draft of the audit request would be discussed with those present, and submitted for approval by the Strategic i+i council.⁸¹

Finally there is a section “The present”. Its main points are:

- On short notice, the education departments will discuss specific agreements with IFC.⁸² Roborgh once more stressed the need for honesty and openness of IFC. It should not make claims beyond its abilities. The education departments should not be cynical but professional;
- Endert and the steering committee are discharged. Kerstens will appoint someone [else] to coordinate the communication ministry-IFC;
- Because the PP doesn’t work as it should, uSG will not pay the remaining 0,6 M€ for the project. Van Spijker says IFC needs the money to keep going. He wants the audit to decide whether the portal works or not. Roborgh notes that it is as clear as daylight that the portals don’t work, that this has been concluded earlier, and that this attitude of Van Spijker doesn’t help. IFC will have to prove that it cannot solve its financial problems by itself. uSG will ask the financial controllers to see what has to be done, and IFC will not be allowed to fail. But whatever the findings, the education departments will not have to pay the remaining budget.

The report of Endert says nothing about the admission of errors. The remarks of Van Spijker suggest the opposite: that IFC persists in its denial of having made mistakes.

Endert sent his report to Schouten for comment. She didn’t react. Of course, professional management (and common sense) requires that official minutes of such an important meeting are made and distributed among those concerned.

On 28/5/08 uSG called a meeting about the PPP with the heads of the education departments. HE was represented by its acting head, Erik Martijnse. uSG informed the heads about the situation and the results of the meeting of the 13th. Views were exchanged about the most suitable auditors for the job and about the organization of the audit. Next, it was discussed what could be done on short notice. What are the quick wins? Agreements should be clear and kept. Problems should be escalated immediately to Kerstens or Van Spijker.⁸³ Up to now the project had been characterized by promising everything and producing nothing. It was decided to start the discussion with the education departments about quick wins as soon as possible.

The above is a summary of the report of Martijnse immediately following the meeting. No minutes of the meeting were made.

Friday afternoon, 27/6/08 4:09 pm, Van Ham, the head of HE, was told that Monday morning, 30/6/08 9:00 am, there would be a meeting of the heads of the education departments, the chief auditor Ed Smid, and Nico Slooff, the financial assistant of uSG. It was to be chaired by Kerstens. The meeting was meant to discuss the draft plan of the audit which was appended to the invitation. 4:47 pm Van Ham asked Endert and Van Velsen to prepare the meeting for him. The request reached them only after the meeting of Monday. Van Ham was the only head present. PE and SE were represented,

⁸¹ i+i= information and implementation. This council was composed of heads of department (in practice their representatives), and chaired by the SG or a DG.

⁸² Agreements about what? Nothing more specific is said in Endert’s report. The report is part of the file CorrBelPortCfl2008b. Search for “blokken”.

⁸³ Sic.

and PAE was absent.

Note that Kerstens was responsible for the project, and therefore an interested party.

Before Friday afternoon, 27/6/08 4:09 pm no draft or part of the plan had been known to any of the education departments. No communication with the education departments about the plan had taken place. A reliable colleague told the author that a draft had nevertheless circulated already for weeks, and had been discussed with IFC. One can only conclude that the procedure was expressly intended to preclude influence of the education departments, while formally abiding by the agreement of 13/5/08.

Analysis of the draft plan showed that it probably wouldn't provide the insight needed to take measures to restore confidence in the continuation of the PPP. It would not answer the question whether IFC can make this type of product. It contained contradictions which made it possible to study or ignore whatever the auditors wanted. Interviews were mentioned as an important source of information. Such use of interviews assumes reliability of the persons being interviewed, while this reliability was part of the problem to be investigated. For these reasons Van Velsen didn't accept the approval of the draft by the meeting (and Kerstens' trickery, for that matter). He wrote a draft memorandum from the four heads of the education departments to uSG with proposals for correction of the draft plan. Speed was imperative, for no change would be possible after uSG had sent the approved plan to the departments. She, and/or Kerstens, was too late to do that. PE didn't want to cooperate, but on Friday 4/7/08 the memorandum could be sent to uSG with the signatures of the heads of HE and PAE and that of the acting head of SE.

The memorandum noted that section 1.2 of the draft correctly stated that the audit was to find out whether IFC was competent to develop products like the PP. However, the definition of the purpose of the audit at the beginning of section 2.1 restricted the audit to the development of policy portals. The memorandum gives an alternative formulation. It proposes to strike out the first two of the four "audit questions" because of irrelevancy. The first question was about expectations of ministry and IFC, the second asked to what extent the present portal answered these expectations. The memo proposes to replace the last two audit questions with a specification of the central question of the audit. It asks the auditors to specify the competencies needed to develop products like portals. As examples of competencies it mentions technical, organizational, managerial,⁸⁴ and communication. It asks for a comparison of the actual competencies with those needed. It asks for examples of products which show that IFC can indeed develop such products. It finally asks to evaluate the abilities of the ministry as manager of an agency that develops ICT-products.

Part of the proposals has been adopted in the definitive audit plan. Details don't matter, for the auditors have not done by light-years what they were asked to do. Neither did they do what might have been expected of them as independent professional auditors.

Tuesday 8/7/08, 4-6 pm, Endert and Van Velsen were interviewed in behalf of this third audit. The interviewers were Smid, Madan Ramrattansing (of the EDP auditpool), en Ender Atalay (EDP auditpool).⁸⁵ Smid limited the discussion to the PPP. Endert and Van Velsen protested, referring to the failure of other projects and the central question of the uSG. In vain. Smid wanted to know if the portal satisfied 90% of the requirements. If so, talking should solve the problem. Van Velsen replied that it would be better to say that it doesn't work at all, because the portal doesn't satisfy basic web directives, and because the OLAP tool doesn't work at all.⁸⁶ This is important for two reasons. Because it shows that IFC is not competent, and that it doesn't communicate openly. Talking has been tried for years. Some things have to change before talking can be expected to be fruitful.

The auditors didn't seem to understand that more than 90% of the information of HE has to be accessed by OLAP. Van Velsen explained that student data have many dimensions, and that this implies very many numbers.

The people from EDP said almost nothing. A few times they asked for elucidation.

Van Velsen thought that the decision making about the audit plan was incompatible with the

⁸⁴ Internal and external; the last with respect to other organizations, such as the ministry and subcontractors.

⁸⁵ At the time Google could not find anything meaningful about this "EDP" on the internet. It should have been part of the government.

⁸⁶ Even if this would represent only 1 of 1000 requirements.

promise of uSG, with the way people were supposed to cooperate in the ministry, and with the code of conduct. Therefore, and as a continuation of their earlier discussions, he sent the SG a mail with a concise evaluation of recent events relating to the PPP and IFC. The mail is dated 9/7/08. Van Velsen mentioned the incompatible interests of Kerstens. He noted that it was about a year ago that he appealed to the SG to enforce the code of conduct, and that no improvement was visible. He didn't understand the need of a third audit. Where there's a will, there's a way. He said he was beginning to doubt the ability of the ministry to correct itself.

On 14/7/08 the SG reacted by mail. It shows no trace of friendliness. The SG denies all wrongdoing, and sees no reason for action. He has no reason to doubt the integrity of Kerstens.

The lack of arguments, the bluntness of the denial, and the "no need for action" was too much for Van Velsen. He sent another mail, showing that the thoughts in the first mail were well-founded. Already a year ago he had informed the SG about the lack of openness and reliability of the progress reports of IFC, and their uselessness for management purposes. He had requested the SG to maintain the code. The SG had agreed that self-correction was better than a formal complaint through an integrity officer. But until now there is no visible improvement. Especially not in the progress reports.

As a consequence of this mail, on 19/8/08 uSG asked Van Velsen to drop in, so that she could explain things. Slooff was present too. He was temporarily acting as account manager for IFC, until a successor for Schouten had been found. uSG began with the audit. She repeated what she had said before, but had not been involved in the formulation of the draft plan for the audit. Van Velsen told her that Endert and he had not perceived the interview with Smid c.s. as inspiring confidence. He made the remarks mentioned earlier. In addition he said that Smid seemed not in the least interested in knowing and understanding how the project had gone wrong. He widened the subject to the progress reports. This however will be treated separately, in the next chapter.

Undoubtedly, the main purpose of this meeting was to appease Van Velsen. uSG took a passive stance. She tried to make an impression of empathy if not agreement. But impressions aren't reality, words aren't deeds, and, last but not least, the words spoken to Van Velsen need not be equal to the words spoken to others. Neither before nor after this meeting did uSG do what she had to do. In all the years of the PPP she never once called a meeting of the representatives of the education departments to explain her management of IFC and the projects. Van Velsen could not believe that uSG really thought that it was sheer coincidence that the meeting to decide about the audit plan took place less than one working hour after the plan had been distributed to the participants, and that this sudden and unheard of haste was in accordance with the "respectful and service-oriented" attitude required by the code of conduct.

The value of words of uSG can be seen in the discussion about the remainder of the budget for the PPP. HE and IFC had agreed at the beginning of the project that HE would pay half of the budget immediately, and the other half upon acceptance. In the meetings of 13 and 28 May 2008, uSG had told IFC that the portal would not be accepted, and that the education departments would not have to pay what was left of the budget. There were no minutes of these meetings, and there was no formal confirmation (on paper).

For his work on budget estimates, John Uitendaal, of the section finance of HE, needed clarity about the necessity of a reservation for payment for the remainder of the HE part of the PP costs. Asked about this, the successor of Schouten, Faïrouz ben Salah, told him that she couldn't find any relevant information. She therefore proposed [«to await the outcome of the audit of the policy portals»](#).

Uitendaal asked Van Velsen for help. Van Velsen sent Ben Salah the report of Endert. Van Velsen also referred to a progress report of IFC which was incompatible with denial of Enderts remarks about the payment.⁸⁷ He noted that the audit was not meant to establish whether the PP should be accepted or not. It should tell us whether IFC can make this type of product. Therefore, it is useless to wait for the report of the audit. He asked Ben Salah to ask uSG to confirm the above. Whereupon uSG told her that she (uSG) wanted to await the outcome of the discussion about the audit report. To Uitendaal this seemed to contradict the decision of May, which in the meantime had been confirmed by Endert.⁸⁸ He

⁸⁷ Sec. 3.5.2 of the document under 20080611 in the directory PPP. For more details see the Dutch version of this report.

⁸⁸ In the time between consecutive mails.

therefore asked Van Velsen to react. On 23/9/08 Van Velsen wrote Ben Salah that the earlier decision had not been conditional.⁸⁹ He concluded his mail with a reminder of the existence of a code of conduct requiring openness and reliability. He suggested Ben Salah to give uSG the report of Endert. «It might refresh her memory. Of course she may have changed her mind. If so, she can simply say so. But she should not deny that on 13/5/08 something else was decided.»

Ben Salah showed this mail to uSG, who felt insulted and became very angry. She thought she was accused of lying. Actually, the purpose of the mail was to show her a way out, and to avoid accusations.

Some time later DGHPE Roborgh dropped his formerly unbending resistance against payment, and joined the chorus that wanted to wait for the audit report.

Because of his offending mail of 23/9/08 Van Velsen had to appear before Roborgh. Van Velsen explained the mail, and promised to contact uSG in order to explain it to her as well. Next they discussed the PPP. Roborgh thought the ministry had been cheated by IFC. He recalled a presentation of IFC of the beginning of 2005, in which IFC painted a far too optimistic picture. He nevertheless wanted to wait for the audit report. He showed nothing like a strategy with respect to IFC, or a long term policy aimed at correction.

The call on uSG was 10/10/08. uSG claimed full integrity. She said that the meeting of 13/5/08 had ended in noisy chaos, and that Endert probably hadn't picked up a reservation which she had made in that situation.⁹⁰ She had been irritated especially by the many copies Van Velsen had distributed of his mail. Van Velsen answered that the recipients were the same as those of the preceding mails, that he had no choice. He advised uSG to have her assistants always make minutes of meetings. That prevents misunderstandings such as this.

On 10/10/08 uSG talked a lot, very much more than on 19/8/08. She was full of self-pity (or play-acted). She could do little if the DG's didn't report and didn't take their responsibilities. She set her hopes on the successor of Van Oldeniel and the audit. In other words: she hoped that things would turn out well of their own accord, without her doing anything. She was well informed, and could and should have acted many times before, but had done nothing. (At least nothing constructive). There was of course plenty of reason to doubt her integrity.⁹¹

Friday afternoon 17/10/08 Smid sent the draft audit report to those concerned. The covering mail asked the recipients to check for errors, and to point out assertions which were insufficiently argued.⁹² Comments were to be sent 5/11/08 at the latest.

On 28/10/08 there was to be a meeting of uSG with the DG's. Two days later, on 30/10/08, there would be a meeting of uSG and the DG's with the top of IFC. To prepare DGHPE for these meetings, Endert and Paul Meltzer of PAE wrote a memorandum with an analysis of the draft report.⁹³ These are some of their more important remarks:

- The executive summary gives the impression that IFC is in order, the technology too, and that only the ministry needs to make a step forwards;
- This is not supported by facts;
- The report tells us nothing that we didn't know;
- The remaining 0,6 M€ should not be paid for the PP. It might be paid to reduce existing risks in human resources, and also for answering ad hoc information requests;
- The report notes that there was no continuing dialogue about portal requirements. But it doesn't look for the cause of this communication problem;
- The report says that IFC tested the portals once, and that the results cannot be found. Though very significant, this fact is not discussed. How is it possible that the portals were

⁸⁹ The mail can be found in the file CorrBelPortCfl2008b. Search for “ontkennen”.

⁹⁰ Don't forget that Endert had sent his report to her assistant for comment, and received none.

⁹¹ This is further substantiated in chapter 4.

⁹² The question about errors is problematic. Auditors should check the facts before they begin with analysis, with drawing conclusions and with the formulation of recommendations. Not afterwards. The author had seen this procedure before. In that case (too) the facts were seriously wrong. The facts were corrected, and the conclusions and recommendations should have been, but weren't. Helping to correct errors may help mislead. Absence of factual errors suggests good work, reliability. If realized in this way wrongly.

⁹³ Van Velsen was on holiday.

tested only once in three years? How could IFC claim good performance if it didn't test? How could the results get lost? Please note: all this in a situation where the education departments regularly complained about the performance, and nothing can have been more welcome to IFC than proof of the ministry being wrong;

- Conclusion: the report is a badly founded effort at soothing.

When Van Velsen returned from his holiday, he noted that people had reacted to the draft as if it were the final version, and as if they should hurry instead of making good use of the time till 5/11/08. They seemed to act as if the meeting of the 30th would consider the report as final, and make decisions. Maybe they thought so on the basis of rumors, misunderstandings or wishful thinking. To Van Velsen however it seemed unwise to make decisions on the basis of a draft when suggestions for revisions could still be sent in. Furthermore he needed time for reading the report⁹⁴ and writing a well-founded and useful comment. He therefore took action to prevent decision making in the meetings of the 28th and 30th. Together with Endert he wrote a proposal for a procedure. By mail of 29/10/08 Endert sent the proposal to DGHPSE. It consisted of the following steps:

- Until 5/11/08 people can draw attention to errors of fact and fundamental differences of opinion;
- The audit department adjusts the report;
- The final report is sent to uSG (who commissioned the audit);
- If desired, uSG formulates an opinion about the report, and draft proposals for action;
- uSG sends opinion and proposals for comment to the departments concerned;
- On the basis of the comments uSG decides.

The mail adds that the meeting of the 30th should be a brainstorming session, where no decisions are taken except about the procedure.

Ben Salah wrote the minutes of the meeting of the 30th.⁹⁵ They show how top managements discuss a real problem. They show a terrible gap between their world of words, and the reality shown in this chapter. They show a management hiding behind euphemisms, and failing to communicate clearly and openly. Maybe these people think they understand each other. But at least the minutes, that is, the report of their words, is ambiguous and unclear.⁹⁶ For example, the minutes say that there is agreement about the need of "a new fresh team", and "a change of team". What they don't say is that this only refers to the representatives of the education departments. To the people who refused to accept the unacceptable. In IFC and the top of the ministry nothing was to be changed at all. Even more telling is the fact that nobody cared to look at the portal. As noted before, it would take only a few minutes to see that it was useless. None of the supposed errors of the ministry could have prevented IFC to make a useful portal.

After a cursory reading of the draft report, Van Velsen smelt a rat. Therefore, and because of the great importance of the audit, he thought it might be useful to write a comprehensive comment. He wanted to preclude the reproof: "why didn't you tell us before?". The result of the analysis was sent to those concerned.⁹⁷ Some of the most salient points are the following:

- The auditors deny that there was agreement about the web-directives. This is untrue, and shows that their work is unprofessional;⁹⁸
- The auditors assert that IFC followed the rules of uSG for project management. This is untrue;⁹⁹
- Chapter 4 of the draft report asserts that IFC is ready to resume the dialogue. IFC is said to be very disappointed that earlier attempts at dialogue have failed. It would very much like

⁹⁴ Of 30 pages plus 20 pages appendices.

⁹⁵ In the directory PPP, under 20081030.

⁹⁶ There is no proof of their understanding each other correctly. Obscurity, ambiguity etcetera are incompatible with accountability anyway.

⁹⁷ It can be found in the directory PPP, under 20081105.

⁹⁸ As noted before: the requirement is included in the *Portal requirements* (= Programma van eisen, adopted in August 2005).

⁹⁹ As shown in the Dutch version of this report (and in the file under 20081105).

to succeed this time. But the auditors don't explain why the earlier attempts have failed, and why the string of useless meetings and broken promises ended. They don't give a single reason for believing that IFC has turned reliable;

- The description of the measurements of the performance of the PP by the auditors is incomplete to such an extent that they are irreproducible.¹⁰⁰ The findings of the auditors do not agree with the findings of the education departments. Which the auditors ignored;
- The auditors don't seem to understand the difficulty of making multi-dimensional data accessible. They didn't ask themselves whether IFC had simply been too pretentious;
- Many opinions in the draft report are formulated as objective facts, but without proof or reference.

The final report was distributed on 26/11/08. Important comments had been laid aside without adequate refutation. Even when they concerned errors of fact.

For the recommendations of the report the reader is referred to the report. No attention is given to them here, because they completely ignore (or even deny) the real problems, and because they played no role in the sequel. Nobody took the audit seriously.

The process of discussions and decision making following the distribution of the report was murky and chaotic. But on 8/12/08 uSG sent a memorandum with her draft conclusions to the DG's, with the request to comment on them, if desired. An earlier draft had been seen and commented by the representatives of the education departments. Only a small part of the comments had been assimilated, and there was no agreement about this new memo. uSG proposed:

- To change the formal status of the PPP from project to running concern. This change was to be accompanied by an inquiry into the performance of the PP;¹⁰¹
- A PPP 2 will start with a new team. It will be managed by DGHPE and the head of PE;¹⁰²
- IP and the communication department develop a proposal for professional management of IFC by the ministry;
- The remainder of the PPP-budget will be paid in advance under condition of demonstrable improvements of quality care and communication.¹⁰³ The final decision about this will be taken after the change mentioned in proposal 1.

Note that none of these points touches underlying causes. Nothing is done to restore the confidence of the education departments in IFC.

Proposal 1 has not been incorporated in the performance contract (PC). The inquiry has not taken place. Proposal 2 means: the project will be continued, with people who are hampered by a lack of knowledge; and the members of the "old" (ministerial) team will be sidetracked. Proposal 3 went down the drain. It was useless anyway. The problem was not the question what had to be done, but doing what everybody knew had to be done. Proposal 4 can only have been meant as a cover for the wish of uSG to pay regardless. She did so in the last days of 2008.

The comment of DGHPE required adjustments of the proposals, but nothing was done with it. Whatever other DG's may have said about them, the final decisions didn't deviate from the proposals. The decisions were laid down in a letter of uSG to the head of IFC of around 19/12/08.¹⁰⁴ The letter concludes with [«thanks to you and your co-workers for constructive co-operation with the audit, and](#)

¹⁰⁰ Of course this is unacceptably unprofessional.

¹⁰¹ It seems that uSG and her assistant did not notice section 4 of appendix 1 of the audit report. The title of this section is: "Inquiry into performance and user friendliness".

¹⁰² Yes, two people. It would take a lot of time before duties/ responsibilities were distributed among these two. It was a waste of time, for nothing came of PPP 2.

¹⁰³ The apparent contradiction is in the original.

¹⁰⁴ It can be found in the PP-directory under 20081219. The letter is signed, but not dated. The letter wants the proposal for the management of IFC, requested by proposal 3, to be submitted in the first quarter of 2009. The proposal never came. Even the formation of a new team turned out to be difficult. In the education departments everyone knew for a fact that the PP didn't work. Nobody wanted to replace colleagues who had defended their interests as they should have.

the elaboration of solutions».¹⁰⁵

The texts of uSG, or the top of the ministry for that matter, seem to try and create a fantasy world. Due to the (known) lack of agreement between words and reality, the letter can only be seen as an effort to mislead possible outside investigators, such as the General Accounting Office.¹⁰⁶

To Van Velsen it seemed that every opportunity to correct misconduct should be seized. He therefore wrote a mail to the SG, expressing concern about the dubious audit report and decision making, and the lack of appropriate action. The mail is dated 11/12/08. Decisions had not yet been made. Van Velsen said he had been startled by the lack of quality of the audit. By selection and half truths, the auditors seem to try and prove a favorable picture of IFC and the PPP. He regrets that they show no interest in the information needs of the education departments. Why does nobody give an ear to their rightful complaints?¹⁰⁷

He drew attention to the risks of auditors lacking integrity. He advised to deal with this problem as soon as possible. In fact, the integrity problem seemed to him much wider than he thought a year ago. He feared that the proposals of uSG would confirm the existing culture instead of purging it. IFC is allowed to do what it likes. The top of the ministry suppresses bad news. It doesn't defend the interests of the education departments and their people.

The mail noted that the proposals of uSG can easily give the impression of a gap between words and deeds. It continued: You, the SG, can avoid this by telling those concerned that many IFC-projects are not running as they should, and that you require professional management, including reliable reporting. You could use your weblog to make this known. Finally, to avoid giving a misleading signal, I advise you to stop the PPP, and to start a discussion with the education departments about their information needs.

By the way, did you know that at the end of last century IFC failed in a similar project, "datawarehouse HBO"?¹⁰⁸

The SG did not react.

2009 and 2010.

Especially section 4 of appendix 1 of the audit report about the performance of the portal was amazing. Before 5/11/08 there had not been time to study this section thoroughly. In January 2009 the dust of the discussions and decision making about the audit and portal had settled. There was time for more analysis.

The text of this section 4 makes a strong impression of bias, manipulation and/or outright deceit. Positive judgments never mention reservations, negative judgments always mention mitigating circumstances. Performance problems are admitted, but not specified. As in the main text of the report, the tests of the education departments are ignored. There is no empathy with their complaints. As indicated above, due to an unprofessional description, the performance measurements were not reproducible and could not be checked. For one thing, the questions the auditors had tried to answer are not mentioned. Relatively many (simple) test questions concerned only a relatively small and simple part of the portal.

Van Velsen was unable to reconcile the findings of the auditors with the tests of HE, and with what he had heard from his colleagues even recently. He simply didn't understand. Only an experiment could resolve the mystery. He formulated some random information questions, and described his efforts to get them answered by the portal in such a way as to make them instructive and reproducible. The questions were neither simple nor complicated.¹⁰⁹ The main conclusions were the following:

¹⁰⁵ No words of thanks have ever reached the ears or eyes of the representatives of the education departments. The acknowledgement makes the letter hard to understand, or even inconsistent. The letter began with «[...] to prevent history from repeating itself.» What has happened that should not happen again?

¹⁰⁶ In Dutch: Algemene Rekenkamer.

¹⁰⁷ Of course, the heads of the education departments should have given their representatives much more support.

¹⁰⁸ HBO= hoger beroepsonderwijs, higher professional education. In the time of the present project, this education was the responsibility of HE, the department for higher education.

¹⁰⁹ Relative to the data characteristics and the portal requirements.

- Making tables with the OLAP tool takes much more time than suggested by section 4 of appendix 1. Even for relatively simple tables. Working with the portal is forbiddingly frustrating. The buttons for definitions and elucidation for example simply don't work.¹¹⁰
- The auditors may have given only the “run-times”, the time the user must wait after having made all selections and other preparatory actions. If so, the auditors should have reported that the necessary preceding actions (such as making selections) take much more time than the final calculation.

In short: the section gives a completely incorrect picture of the performance and user-friendliness of the portal.

For the detailed report of this experiment the reader is referred to Appendix 2-1 of the Dutch version of this book.

Van Velsen had not expected intentional deceit, but could not interpret the results otherwise. The more so since the results were shown to be reproducible on the computers of the head of his section, and that of Ron Minnée, the successor of Van Ham as head of the department HE. Martijnse nor Minnée showed any surprise. None.

To show that the deception of the auditors was not limited to a single subject, two more subjects were analyzed: the web-directives as part of the portal requirements, and compliance with Prince2, the project management method prescribed by uSG.¹¹¹ These subjects were chosen because of their importance, and because correctness of the corresponding information in the audit report can be established objectively. It turns out that in these cases too, the auditors conceal or smooth over defects, and do not hesitate to dish up lies.¹¹²

It follows that text selected for checkability, but apart from that at random, is incorrect. Therefore one should not trust the other part of the text.

It also follows that the auditors have not worked in accordance with their (professional) code of conduct.¹¹³ The auditors are part of the problem. The fact of a third audit in itself already shows that something more or “deeper” must be amiss. A single audit should have been sufficient. If a management cannot solve a problem after two audits, why after a third? Worse, given that no action was taken after the first two audits, and given the repressive behavior of the top management of both the ministry and IFC, the hypothesis that the audit was ordered to provide a positive evaluation seems highly probable. Fact is that the auditors and their superiors¹¹⁴ have been instrumental in a cover up of misbehavior and failures of IFC and the top of the ministry.

The audit department is the final instrument for self-correction of an organization. The fact that it failed its professional standards¹¹⁵ and isn't independent means that the organization cannot correct behavior that involves its top. And in a hierarchical organization the top is almost always involved.

In the first months of 2009 it was very unclear how the PPP was going to be continued. Nothing much happened. On 24/3/09 Bas Derks¹¹⁶ of HE and Van Velsen were asked to see DGHPSE Roborgh in connection with a visit that Roborgh would pay next day to IFC. Roborgh didn't know what was expected of him in the PPP. He said he hadn't done anything about it since the end of 2008. He said he didn't know the letter of 19/12/08 of uSG to the new head of IFC, Jan Jurgen Huizing. In this letter she tells Huizing that DGHPSE will head a “new team” for the PP. Roborgh told Derks and Van Velsen that he would go to IFC to see how the PP worked. He would operate the computer himself. He didn't

¹¹⁰ This had not changed since 2 (two) or even 3 years ago. There were more problems which had been reported to IFC in 2006 or 2007 but had not been resolved. The auditors should have tried to find out why.

¹¹¹ The instruction and a description of the method can be found in the directory Project and agency management, under 20071130.

¹¹² For the detailed reports of these analyses the reader is again referred to Appendix 2-1 of the Dutch version of the present report.

¹¹³ Which can be found in the directory Integrity. The directory includes the INTOSAI and IPPF codes, and, under 20100831, the text of the web-pages of the audit department of the education ministry and the flyer with “principles of proper auditing”.

¹¹⁴ Who co-signed the report.

¹¹⁵ On the website of the audit department it presented itself as the ultimate standard of integrity and reliability.

¹¹⁶ He was the successor of Endert as head of the policy section. Endert had become deputy head of SE.

want preparation. He wanted to be as unbiased as possible.

When he came back from his visit his judgment about the portal was devastating. He said it simply didn't work at all. He was nevertheless positive about the visit. Many IFC-people had been present at the test, the new head of IFC among them. Huizing admitted that the portal didn't work, and said he would very much like to get it in order.

This visit can be considered to mark the beginning of the end of the PPP. The remainder of this chapter is devoted to transition phenomena and the activities which came in its place. This is important mainly because it confirms that the PPP produced nothing useful. In addition it shows that no lesson was learned, and no improvement realized.

The PPP was replaced by two other projects: a project datawarehouse, and a project, or at least a working group "Policy, information and cooperation" (PIC). From the beginning of the PPP, IFC had said that most of the budget for the PPP would be spent on building a datawarehouse (DWH). Even if this could not be seen in the progress reports.¹¹⁷ The DWH was to be the brains of the PP. And of other portals. But it would be paid by means of the PPP. As a consequence of inadequate information and progress reports, the ministry never understood what this DWH was or was meant to be.¹¹⁸

On 6/4/09 the (top) management team of the ministry, abbreviated MTM, was asked to agree with a proposal for four "infrastructure projects". They were to be carried out for the greatest part by IFC, and for a minor part by IAG.¹¹⁹ One of the projects was called "datawarehouse and public portal". According to the document describing the proposals, the purpose of the project was to fill the DWH with data about individual pupils and students, and to make aggregated data available through a public portal (website). In a summary of the given situation, the document says that at this moment the DWH only contains aggregated data. For information about for example efficiency and location dependent performance and developments, data about individual pupils and students are necessary. At present, such information is derived by IFC-people, "by hand". This may result in double work and human error. IFC expects an increase in information requests, and as a consequence a shortage of human resources.

The document gives several (dubious) answers to the question: "What goes wrong if the project is not carried out?". It says that the DWH has to be filled, managed and made accessible. At present, there are serious problems with all three processes. Consequences of these problems are indicated.

The project activities consist in "adjustments" of the three processes. The "adjustments" are not specified. No mention is made of documents where specifications can be found.

The project had not been discussed with the education departments.

A budget of M€ 2,3 is requested for the project.

The document implies that the PPP has not produced the DWH and portals that had been promised. The DWH should have been ready and working. It was the principal part of the PPP, and must have cost about 3 M€.¹²⁰ The document continues the black box policy of the PPP.¹²¹ What was realized in the PPP, what went wrong, what has to be done, and what will be the result? The document gives no answers. In fact, the work of the past four years is completely ignored.

The minutes of the MTM-meeting say that a risk analysis will be made for the DWH. And that the project plan will be discussed with the DGHPSE-departments.

The risk analysis was made by Bram Gakeer of IP. He discussed the risks with Van Velsen. Gakeer knew nothing about the present state of the DWH. He didn't know how a DWH was to be described.

¹¹⁷ Indeed, as far as the progress reports were concerned, the DWH could as well not exist at all. For information about the DWH, the ministry depended fully 100% on what IFC told it.

¹¹⁸ Of course, the ministry should never have accepted this refusal to explain and account. Lower levels didn't, but were let down by their top "management".

¹¹⁹ See the papers under 20090402 and 20090403 in the directory Project and agency management. The papers of 20090403 include notes by Van Velsen.

¹²⁰ Excluding the costs of the time and energy of ministry employees, and the costs of harm done to people, and of additional corruption of the ministry and IFC.

¹²¹ And all other projects, see the next chapter.

The discussion resulted in agreement about risks that should be mentioned, and about a plan for the restoration of confidence. But Gakeer kept none of his promises. He didn't send Van Velsen a copy of the documents he sent to the MTM. It had been agreed that the risk analysis should ask the question: can IFC do what it is supposed to do in this project? But it wasn't. It was tacitly assumed that IFC was competent, and that its abilities had not been overestimated. The "risk analysis" bristled with rhetorical trickery making light of risks and exaggerating opportunities. Even lies were thought to be necessary to "convince" the reader. The analysis suggests that the failure of the PPP was caused by lack of clarity about portal requirements. Which is nonsense: there was no lack of clarity at all. Gakeer gave no estimate of the size of the risks, if only on the basis of experience. If estimates had been made honestly, the chances for success would have been found to be very small.

But the dirtiest trick of the "risk analysis" is in the tail. It asks for approval not only of the risk analysis, but of the project proposal as well, including the budget. The amount of which isn't mentioned.

The document "Risk analysis DWH" was dealt with in the MTM-meeting of 11/5/09. According to the minutes of this meeting «all proposals in the risk analysis are approved. But a progress report is to be included every 3 months in the risk scan for the MTM.»

The risk scan of the second quarter of 2009 reported as follows:

«The development of the DWH is followed critically by the education departments. This is a consequence of experiences with similar projects in the past. One of the most important success factors of the project DWH is the support of the education departments. They must gain confidence in steering by demand, and in the usefulness of the products of the project. [...] The timetable of the project can only be determined after specification of the information which is to be included in the DWH.»¹²²

That support of the education departments is one of the most important success factors wasn't mentioned in the risk analysis.

The report says nothing about progress. The remark about the timetable is peculiar. The education departments had specified this information years ago, at the beginning of the PPP. Gakeer had been told so. Obviously, his behavior didn't exactly inspire confidence or support.

Of course the education departments didn't believe in a speedy solution of the problems with the portals or DWH. Therefore they were looking around for other ways to get the information they needed. Already for years there were arrangements with IFC for the handling of ad hoc information requests.¹²³ After the failure of the PPP, the departments took coordinated action to get money that was earmarked for technical solutions reallocated to the expansion of human resources for answering ad hoc information requests. This action was successful, even though implementation took time. MTM charged a working group with answering some questions about ad hoc information requests and the organization of the answering. Questions of which the answers were already known.¹²⁴ The document defending the proposal shows that the PPP has not achieved its purpose, even if shrouded in mendacious phraseology: «The project policy portals 1 had started from the unrealistic assumption that the instruments could be made suitable for everybody.» Anyway, the document doesn't assume the least help from a portal.

In a draft note "Project policy information/ policy portals" by Jaco van Rijn of PE and Sjerp van der Ploeg of IFC, dated 26/11/09, one finds the following paragraphs:

«The education departments use the policy portals hardly or never. For ordinary people the portal is

¹²² The risk scan can be found in the subdirectory Project reports of the directory Project and agency management, under 20090511. The risk scan mentions the SG as the manager responsible for this project, and Arnold Jonk, head of IP, as his representative for this project.

¹²³ These are questions that cannot be answered by websites or other computer systems. The arrangement of HE was laid down in the performance contract. The arrangement prescribed who was authorized to ask or receive questions, and how many days answering might take. HE also had an arrangement for urgent information requests, for example related to questions of parliament.

¹²⁴ As far as HE was concerned, the arrangements were adequate. IFC may have run the risk of insufficient capacity (people), but whether or not this risk was serious is not known to the author.

too complicated, for specialists it offers too little surplus value as compared to working with the complete data files which are supplied periodically. [...]

The education departments hardly use the present policy portals. The portals seem to be based on an incorrect policy theory: the expectation that the people in the education departments could extract all of their policy information from the portals themselves has turned out to be unrealistic.»¹²⁵

As if not the portals, but the users are the problem.

The note was written for the working group i+i. Next it was sent to the Strategic i+i council. This was chaired by the SG. From the minutes of the Strategic i+i council it is impossible to gather what was decided. Fortunately, this is shown very clearly in the “Consolidated progress report risky projects ministry” for the first quarter of 2010.¹²⁶ Under “Policy portals” one can read:

«The Strategic i+i council has decided to stop the development of the policy portals per 1/1/2010. This has been done. [...]

The Strategic i+i-council has decided

With respect to technical aspects:

- To stop the PP¹²⁷
- To continue the development of the public portal

With respect to organization:

- To secure the positions of the information specialists in the education departments

With respect to the cooperation ministry-IFC:

- Strengthening the relation ministry-IFC on the interface policy-data by thematic bundling of expertise. [...]

The risky project PP has been ended. Therefore it is proposed to stop the progress reports about the PPP.»

Don't forget that the information systems that existed until the beginning of 2006 had been dismantled, and that the people who had kept them up to date had been fired, and left the ministry. With the money wasted on the PPP these people could have maintained and even improved the system for over ten years. Those who have proven their dishonesty and incompetence have kept their jobs and work on other projects. Some of them were promoted to the top of the fused agency NEA.¹²⁸ The conclusion is that due to the PPP both the provision of information and the organizations have deteriorated.

2.5. Epilogue.

At the end of 2007 Frans Dijkstra, the head of the section Information and analysis of the department of higher education, retired. He left what his colleagues called a “testament”.¹²⁹ a document entitled “Some aspects of policy analysis higher education”.¹³⁰ It analyses some subjects of policy in historical perspective. Chapter 11, Information policy, contains the following paragraphs:

«Policy portals are the sequel of the data depots on which IFC was allowed to spend much money and energy from 1999-2002. The purpose was the same: to save quantitative data, and make them accessible for users in policy departments.¹³¹ The concept “portal technology” has a strong mystifying effect. Put simply, it means that one can use various computer applications through a single interface. In this case a website. Nowadays, such an interface can be used by every computer, without special software. A web browser suffices. (Possibly apart from complications arising from, for example, lack

¹²⁵ The file in the PPP-directory is dated 20091207. The author couldn't find the version of 26/11/09. The quoted text is the same in both versions.

¹²⁶ In the subdirectory Project reports of the directory Project and agency management, under 20100414.

¹²⁷ Yes indeed, the policy portals, not the project (PPP).

¹²⁸ See the next chapter.

¹²⁹ In the sense of last will.

¹³⁰ In the PPP-directory, under 20071100.

¹³¹ Policy departments: such as HE, PAE, PE and SE.

of tools to read Java-scripts). Access by means of the internet is the great advantage of the policy portals. But behind the interface lie the same problems as of the KIS-system¹³² or the datawarehouse HPE¹³³: the information must be saved in a structured way, and be easily accessible and aggregatable. A system which can present every imaginable combination of numbers on the computer monitor at the request of the user in a very short time is infeasible. It is necessary to find a compromise, and select, calculate and set out frequently used tables.

Since 2004 IFC is busy developing a policy portal for HE, PAE, PE, and SE. At the time of writing, August 2007, the results have not been accepted by any department. To all appearances, it seems that we have once more fallen in the pit Wouter Keller warned against in 1993 (see above)¹³⁴: *Projects which are too big to complete with a small team in a single year can better not be started.* The PPP has a sizable team, and is in its third year. The team has been changed during the project: both the external and internal project leader, and the software supplier have been replaced. Most continuity can be found in the senior collaborators of IFC and the representatives of the education departments.

Another pitfall often encountered, is the tumbling of new projects one over the other(s). This has to do with drawn out timetables.¹³⁵ The policy portals of HE, PAE, PE, and SE were far from completed when IFC began with a public portal, which was to make quantitative information about education accessible for the public (such as journalists, schools, and researchers). Furthermore, it opened a supervisor portal.»¹³⁶

Dijkstra discusses more of this kind of projects. He concludes that the problems, including the lack of learning from experience, are systematic. But his testament is not only interesting because of this evaluation, but much more because he only makes these observations at his farewell. Dijkstra was the head (“manager”) of Van Velsen. When he asked Van Velsen to succeed Veen as representative of HE, he warned Van Velsen against some aspects of the behavior of IFC. But although the testament might make you believe otherwise, he never supported Van Velsen actively.¹³⁷ On the contrary, in situations where he may have perceived pressure he publicly deserted him.

As can be inferred from the quote and the testament, Dijkstra had appreciable talents. Moreover, outside an organization like the ministry or IFC (and so on), he probably was a kind and honorable person. But he was not only unable to resist the influences of his corrupt environment: he collaborated actively. Nevertheless, the quotation shows that even after 30 years of working in a madhouse he had not lost all common sense.

¹³² Unknown (and irrelevant: no more than false pretensions).

¹³³ HPE= higher professional education, later part of HE.

¹³⁴ The “see above” refers to text in the testament.

¹³⁵ It even causes them to be delayed.

¹³⁶ The quote is from p. 94. Please take care: in the quote, opinions, assumptions, etcetera are often phrased as facts.

¹³⁷ Not passively either (say under four eyes). Except in the meeting with Van Ham and Spijker in March 2005. At that time he may have thought Van Velsen had the backing of the SG.

Chapter 3.

Project and agency management by a ministry.

Table of contents of this chapter.

1. Summary and conclusions.
2. The origin of this chapter.
3. The project management of the undersecretary-general.
4. The project reports and the merger of IFC and IAG into NEA.
5. Notes about some specific projects.
6. Accounting for the maintenance costs of studylink by IAG/NEA.
7. To conclude. The General Accounting Office evaluates the consequences of its ICT-reports.

3.1. Summary and conclusions.

1. All except 1 of 9 randomly selected IFC projects were delayed for more than 2 years, had appreciable budget overruns, and/or failed to realize their goals. The exceptional project had a delay of (“only”) 2 years.
2. The author knows of no project that was completed successfully in the time and for the money allotted. Many projects produced nothing useful.
3. None of the projects was preceded by a cost-benefit analysis. The projects were motivated by arguments pro, and, sometimes, claims that arguments contra were irrelevant. For none of the projects it was even plausible that benefits would exceed costs.
4. In important respects the reports about the progress of the projects were incomplete, untruthful and inconsistent. This can be concluded from a comparison of successive reports. This has been reported to DGs, uSG and SG. uSG promised to do something about it. But she didn’t supervise the implementation of her words, and no substantial improvement took place.
5. After the merger of IAG and IFC the progress reports became worse or disappeared. After the merger, only central organs of the ministry received reports, and only about so-called “risky projects”. For the selected projects they gave more information than previous reports. But in important respects they remained incomplete and unreliable.
6. The projects seem to have been approved on the basis of advertising and wishful thinking. Although the relevant documents may just as well have been intended to mislead for example external auditors of the DGAO.¹ None of the projects had been properly thought out. The projects seem to be based on the illusion that everything that can be imagined can be made. Sometimes a project would result in doubling existing services. As in the case of education statistics.²
7. In all projects difficulties and risks were underestimated.³ By both ministry and agency. Often there wasn’t even reason to assume that the agency had the required competencies. On the contrary: experience had shown that it lacked them, and that failure was very probable.
8. Neither ministry nor agency applied available know-how, learned from experience, or reasoned competently about (new or current) projects. They did nothing constructive with critical remarks. Examples of available know-how are Prince2 and the reports of the DGAO.

¹ DGAO= Dutch General Accounting Office.

² For decades, these had been collected only by CBS, the (Dutch) central office for statistics. CBS was financed by the ministry of economic affairs, and otherwise independent.

³ Or not estimated at all, or in a useful way, as in the new datawarehouse project. See the chapter on the PPP.

9. In particular, no lessons were learnt from the failures of projects.⁴
10. uSG had prescribed Prince2 as the method for project management. But in practice no method was followed at all.
11. The words of uSG don't agree with her deeds. She doesn't supervise the implementation of decisions and agreements.
12. The ministry always provides money to cover up failures. Projects may always be repeated with new money. If desired under a new name, as if it were something new.⁵
13. The higher management of the ministry actively represses signals about malfunctioning. It tries to prove that they are unwarranted, or ignores them. The internal audit service actively supports this policy, thereby violating its professional code.
14. None of the minutes of management discussions about topics discussed in this and other chapters betrays any willingness to mention real problems, and the ability to analyze, let alone solve them. There is no open discussion. This picture is consistent with all other available information.⁶
15. The merger of IFC and IAG seems to have been dictated by SG without good reason. No tenable motivation has been found. The merger has not been discussed openly. The argument of overlapping activities ("waste") is false. In general, activities were complementary, and overlap minimal.
16. The merger was attended by a change in the formal relationship between the new agency and the ministry, and with changes in staff. "Managers" of IFC got relatively high positions in the merged organization NEA.
17. In the ministry, the contract management of NEA was centralized at the cost of the education departments.
18. For the contract management of NEA the SG was represented by a temporary contract manager. After two years this function was supposed to have made itself redundant. The person charged with the contract management had no previous experience with agency management, and eliminated everybody who had been critical of IFC from the relevant network. The past should be left alone, a fresh start was necessary.⁷
19. There was no reason to assume that the organizational structure had caused any problem. Neither was there reason to assume that the merger and attending changes would bring improvements. In fact, they might as well cause deterioration.⁸
20. The problems with the projects can be explained easily and completely by incompetency and lack of integrity of all "managers" involved. There being no positive proof of competency except the competency to conceal the falseness of their pretensions and those of the political bosses.
21. None of the authors of the documents quoted in this chapter can be accused of openness. In discussions about projects, nobody notes that a goal has turned out to be unrealistic. Nobody

⁴ Which can be explained as a consequence of their denial: no failure, no need for explanation and improvement.

⁵ This was already seen in the previous chapter, with the PPP. The renewal project of the IAG, to be reviewed in chapter 5, is another example.

⁶ Most importantly, that there is no improvement.

⁷ In other words: he wanted to start from zero, and didn't want to learn from experience.

⁸ According to the present author the people are much more important than the organizational structure.

acknowledges that problems and failures are the rule, and tries to analyze the causes of their systematic character. Nobody connects the problems with the ICT-reports of the DGAO.⁹

22. The prolonged resistance against the misconduct in the PPP was exceptional. The author thinks he would have heard if colleagues in other projects had resisted similarly. But he heard nothing. Most colleagues remain passive, some collaborate actively.
23. The code of conduct of the ministry (applicable to the agencies as well) plays no role in the projects whatsoever. Even though SG was asked explicitly to enforce it. The code can only be meant to mislead outsiders.
24. In the higher management nobody acts responsibly. As (s)he would if (s)he knew his/her actions were public.¹⁰
25. Summarizing. Only on the basis of a most superficial analysis can one conclude that the problems are caused by difficult ICT.¹¹ The evidence presented in this chapter proves that ICT projects are started due to overly simplistic thinking, arrogance, insufficient self-knowledge and insufficient knowledge of the organization, far too easy money,¹² and unwillingness to think about the (well-known) requirements of a successful project. Projects fail for these reasons, and because of a host of other deficiencies such as lack of integrity in communication, lack of the ability and willingness to learn, and, last but not least, (de facto) absence of external control.

The summaries and conclusions of the sections on Studylink and the 2012 DGAO report are not included in the above. They can be found directly under the heading of the corresponding section.

3.2. The origin of this chapter.

The responsible managers of the ministry remained passive under the reports about the problems in the policy portal project (PPP). They never gave active support to their representatives, and never recognized the seriousness of the problems. Even after years of problems and failures, the top did no more than order a third inquiry.

Soon after the first problems in the PPP, the attitude of their managers made the representatives of the education departments skeptical about the help they could expect from the top of the ministry. The DG's seemed not to be surprised. They implicitly or explicitly suggested that the problems were of minor importance, and solvable by "good discussions". And after all, whatever the problems in the PPP, the other projects were running smoothly. The last assertion was unproven however. If true, it was hard to explain. Why was PPP exceptional? How to explain that the IFC people working in the PPP lie, cheat and fail systematically, while behaving decently and competently in all other projects?

When correction of the PPP turned out to be hard or impossible, the doubts of Endert and Van Velsen about the other projects increased. But more information was needed to get certainty. Information was not only important for understanding what was going on, but also to determine a line of conduct with respect to IFC and the management of the ministry. If the PPP was not an exception but the rule, the case for action by the management would be much more compelling.

In June 2006, at the request of the representatives of the education departments, DGPS Rob Kerstens, representative of uSG for the PPP, had installed a new steering committee. Halfway 2007 Endert, the chairman of the committee, told DGPS that the committee had not been able to realize the required improvements, and that IFC systematically failed to provide necessary information and keep its promises. DGPS remained passive. He only approved a proposal for an inquiry into the possibility of making multi-dimensional tables available through the internet, and to do this in a way consistent

⁹ Reminder: ICT= information and communication technology.

¹⁰ If he or she could, which has to be doubted. In fact, it is a little bit misleading to say that the concealment is due to competence. It is actually due to competence *in combination with the (ab)use of power*.

¹¹ A difficulty which is moreover relative.

¹² And the absence of a need for proper accounting.

with the applicable governmental directives. On the basis of the results of this inquiry the representatives of the education departments should make a proposal for the continuation of the project.

Parallel with, and independent of the above actions, Van Velsen had shown the SG that IFC systematically violated the code of conduct of the ministry. He requested the SG to ensure that the code was respected. This development will be described in more detail in the next chapter. For the present it suffices to note that initially the discussion SG-Van Velsen looked promising. And that SG actually did little or nothing helpful. His attitude underlined the importance of information about the other projects and activities of IFC. But reliable information was hard to get by. Colleagues involved in projects and activities were unable to give a clear picture. They only gave impressions. Except that it was obvious that there were hardly any meaningful project documents. And that there were no progress reports beside those sent to uSG.

It had been very time consuming to arrange a meeting of Endert with DGPS.¹³ There was no question of an “open door” or “dropping by”. In fact, there were only few opportunities for discussions with DG’s or (u)SG in or outside formally organized meetings. One could do next to nothing with remarks about IFC projects unless one had a function that required supporting a DG or the uSG in his or her role as contract manager of IFC. Such a function would, in principle at least, also provide information about the other IFC projects. Van Velsen decided to look around for such a function, and for an opportunity to get it.

The opportunity came when his section Analysis was discontinued because of budget cuts and the retirement of its head. The duties of the employees of the section were distributed among the remaining sections of the department. Where useful or desired, duties were reshuffled among employees. In this situation Van Velsen offered to take over the contract management IFC from a colleague who wanted to get rid of it.¹⁴ Towards the departmental management Van Velsen was clear about the way he would fulfill his duties. As examples he mentioned his contract management of IAG and the way he worked in the PPP. In other words: the management of the department knew what to expect of him. He said he only wanted the job if they agreed. They did. So by 1/1/08 he moved to the section Management, and became his departments’ contract manager for IFC.¹⁵

3.3. The project management of the undersecretary-general (uSG).

The first thing Van Velsen was asked to do in his new job was to help advising uSG about a proposal of IFC for a project Accounting. The project was part of the program Rounding off Customer Oriented Services. There were three projects in this program. The other two were called Financing and Digitizing. Each of the projects had a (proposed) budget of 3 M€. The following are some of the remarks Van Velsen made about the proposal:

- The proposal is too vague about what will be done or made. There is no sketch of the present and future situations;
- There is no specification of the quality norms for the products;
- The proposal doesn’t indicate how it can be ascertained that the products have been completed and satisfy the norms;
- The costs are not properly substantiated, and not related to the products;¹⁶
- The section about the benefits is formulated in abstract (vague) terms, and lacks proof. Risks are said to exist, but are not specified;
- The proposal suggests that there are relations, and possibly overlap, with other projects and activities. It should specify them, so that their importance can be evaluated;
- For a project of this size the ministry should ask the advice of an independent external expert.

¹³ This may have been, or probably was, malicious intent.

¹⁴ Note that this is not purely accidental. In job vacancies as in the supply of used cars and homes and many other items, defective items are over represented.

¹⁵ In addition to that for IAG.

¹⁶ Later in this chapter it will be proven that the claim for the maintenance costs of Studylink had no acceptable foundation whatever. It can have been guess, but may as well have been no more than a seemingly realistic amount, and an effort at shoplifting.

Of course, the expert will need more information than provided by the proposal. The additional information should also be given to uSG;

- Progress should be evaluated periodically by an independent external expert;
- The role of the users of the final products should be described less vaguely and noncommittal;
- The proposal suggests that a sequel is necessary. This looks like salami tactics, and should be explained and taken into account in the evaluation of the proposal.

He concludes that the proposal cannot be accepted, and that IFC should be asked to write a proposal that takes account of the above remarks.¹⁷ The proposal was nonetheless accepted unchanged. According to the assistant of uSG for IFC, Michaela Schouten- Van den Boom, “remarks about details” could be dealt with in the project initiation document (PID), which was to be written in a following stage.¹⁸ Van Velsen replied that uSG should only agree and sign if it was sufficiently clear what she agreed with.¹⁹ As yet, this simply could not be the case.

According to its timetable, the project should run from August 2008 to February 2009. In March and April 2009 the results would be tested, put into use, and evaluated.

The acceptance of the proposal is hard to reconcile with a resolution of a meeting of uSG with the top management of IFC on 29/5/07.²⁰ According to the minutes of the meeting, the ministry and IFC will further professionalize their collaboration. Especially with respect to projects. It had been found that agreements had not been made properly, and that this had caused problems with payments. Sometimes there was no project proposal or instruction signed by uSG.²¹ From now on Prince2 will be applied wherever possible.

On 30/11/07 this was followed by a memorandum of uSG to the DGs with a description of a slightly modified Prince2, and the request to put it into practice.²² The DGs are requested to pass the request on to the heads of their departments.

The proposals for the two other projects in the program, Financing and Digitizing, had already been accepted in 2007. They were just as defective as that for Accounting. Van Velsen did not understand why the prescribed procedure, Prince2, had been ignored, and why these utterly unprofessional documents had been accepted. He asked Schouten for an explanation. She asked her assistant, Martijn van der Valk, to reply in her stead. In his reply, Van der Valk sketched the history of the program.²³ He said that preparatory documents were considered as the documents required by ministerial procedures and Prince2. (Even though their contents was very different from what was required of such documents). He concluded that the program involved quite a lot of money, and that Prince2 had been “adapted” for that reason.²⁴ Of course, the “adaptation” consisted in non-application, while the size of the program should have been reason for more instead of less careful decision making.²⁵ From their experience with other projects, uSG and her assistants should have known that IFC projects are always very risky. This should have been reason to ask IFC to think and prepare more and better (instead of less), and to show that it had done so.

In retrospect it seems that somehow 9.5 M€ had been found. The question was whether this money could be invested in such a way as to pay itself back in time, with a dividend. This question is not answered convincingly in any of the available documents. The documents suggest that IFC had at most a vague idea of what to do with the money. They suggest that it still had a lot of thinking to do, and that the result might very well be that there were not enough possibilities for spending so much

¹⁷ The mail with the advice is dated 18/1/08. It can be found in the directory for this chapter.

¹⁸ The PID is part of Prince2, a method for project management.

¹⁹ Agreement with the proposal meant commitment of the money, 3 M€.

²⁰ In the directory of this chapter, under 20070529.

²¹ Still according to the minutes.

²² The memorandum can be found in the directory of this chapter, under 20071130. Under the same date one finds the two appendices of the memorandum. They describe Prince2 as adapted by the ministry.

²³ The mail can be found in the file CorrCfl_Overig_2008.

²⁴ In other words: at first he suggests that Prince2 has been applied correctly, only to admit a few sentences later that it has been “adapted”.

²⁵ The reasoning of Van der Valk is a typical after the fact reasoning.

money profitably.^{26, 27}

Remarks about the further development of these projects can be found in section 3.5.

The activities of IFC in a calendar year, the budgets which the ministry makes available for them, and other agreements with respect to activities, products and the cooperation ministry-IFC, are described in a “performance contract” (PC). It is signed by the uSG and the head of IFC. The document has the form of a contract, but doesn’t really play a formal role. It has real significance all the same. If in the course of the year the ministry asks IFC to do something additional, IFC will refer to the PC and ask for additional money, or say that some other job has to be skipped or temporized. In other words: in the periodic discussions ministry-IFC the PC plays a normative role. But first of all, it provides clarity to everyone concerned by listing activities, and by eliminating at least some of the ambiguities about products, services, and duties of the contracting parties. Examples of PC’s can be found in the directory of this chapter.

Theoretically the PC should be ready before the year begins. But as in the preceding years, the PC for 2008 had not yet been completed in January. This gave Van Velsen the opportunity to ask the editors to include a section about project management. He proposed a text which asks for compliance with the instruction of uSG mentioned above. The proposed text includes the following sentences:

«For each project a progress report will be sent to the representative of uSG for the project at least once every two months. The report will deal with each of the topics mentioned in the project proposal or similar documents. It includes a summary. The representative is responsible for the correctness of the report. He confirms this with his signature. The summary is sent to the periodic meetings of uSG with the IFC management, where necessary supplemented by comments and recommendations of the representative.»

This request was complied with. The text is included in section 4.8, “Project management” on p. 20 of PC 2008.²⁸

The request was an effort to try and improve the reporting practice. In general there were no progress reports deserving the name.²⁹ Once every two month there was a meeting of uSG with the top of IFC. A few days before these meetings IFC sent uSG a paper with unreliable³⁰ micro-reports of over 20 projects. These papers had not been seen or checked by anyone in the ministry. Of course, without relevant and reliable information, management is impossible. Section 4.8 of the PC was meant to bring about three important changes:

- There would be useful and reliable reports for all projects;
- Ministerial representatives became responsible for the reports, and were provided with a channel for communication with their DG and with uSG on a regular basis;
- The reports would no longer be fixed one sidedly by IFC.

In the course of 2008 study of successive papers related to the contract management of IFC showed that many of the IFC projects had serious problems. Often, as in the case of the PPP, the reports IFC sent to uSG were untruthful. They always were too rosy. They hardly gave any useful management information. Section 4.8 of the PC was not carried out. Not at all. There is no indication that uSG or her assistant(s) have done anything to have it put into practice. Worse: they didn’t do anything to put

²⁶ Considering that it is clear anyway that the people involved don’t bother about integrity, one wonders if the documents have been written as a cover up for the reservation of 9.5 M€ for IFC, in order to suggest that the approval of uSG was well-founded. In other words: to make it seem on paper that everything had been done properly. The program may well be a kind of conspiracy of uSG with IFC, effectively to cheat the taxpayer.

²⁷ Regarding integrity and accountability it is noted that the project proposals and the documents mentioned by Van der Valk in general don’t mention the names of authors or those responsible. Under “File Properties” one sometimes can find a name, but this need not be the name of the auctor intellectualis, and in general is not the name of the person who is responsible.

²⁸ PC 2008 is included in the directory of this chapter, under 20080307.

²⁹ The author checked this with the departmental representatives of the ministry for the projects. It turned out that there were papers called “report” for 9 out of more than 20 projects. (In no case the name “report” was justified). At a later moment this state of affairs was confirmed by Frank van Loon, top manager of IFC. Van Velsen asked him to produce the reports, and he only sent these 9. This matter will return in the main text.

³⁰ Often misleading, and sometimes simply incorrect on important points.

Prince2 into practice, or to evaluate the effects of her memorandum of 30/11/07.

On 4/2/08, Schouten sent the IFC projects report about November and December 2007 to the contract managers in the different departments. That is, to Van Velsen and his colleagues. She asked them to send her their remarks 7/2/08 at the latest. The report and the remarks were meant for the meeting of uSG with the top of IFC on 11/2/08. After consulting his colleagues of PAE and SE³¹ Van Velsen sent Schouten a mail that included the following:

«The public database/ public portal is not mentioned. It may have been renamed “Facts and figures” (treated in section 2.1.13), but if so, that should be noted. If 2.1.13 is about the public portal, it [= the section] is useless for uSG.

The report doesn't give a useful picture of the progress of the projects. It seems to say no more than: everything goes well. However, this definitely isn't true for the projects I know of. If I compare the report with the recent draft-information plan, I do not understand why the report says nothing about the problems which that plan proposes to solve. Such as the pretended need for “ordering of the production process”.

I don't understand what uSG can do with a report like this. I wouldn't have this problem if the report would comply with Prince2. Therefore, I propose that uSG requests IFC to include at least the following elements in its project reports:

- The products that should have been delivered in the reporting period, and those actually delivered;
- The products that are to be delivered in the next reporting period;
- The state of affairs regarding the solution of problems reported earlier;
- New problems and proposed solutions;
- Financial state of affairs and expected development;
- Risks;
- The names of the departments that are going to use the products of the project, and the representatives of these departments for this project;
- The name of the responsible representative of uSG for this project.

In earlier mails I have given several examples of incorrect reports. To ensure the reliability of the reports they should be confirmed by the representative of the ministry who is in daily contact with IFC about the project. Also on behalf of Ed van der Groep (SE) and Peter Lourens (PAE) I would like to ask you to request uSG to put the above proposal on the agenda of her next meeting of uSG with the top of IFC.³²,³³

Schouten answered in a mail of 8/2/08. She thought “Facts and figures” referred to the public portal, and agreed that this could have been indicated more clearly. With regard to the projects report she thought that it was already much better than a year ago. In 2008 further improvements might be made. But a distinction should be made between reports for project leaders and those for the top management. According to Schouten Prince2 was to be applied mainly by project leaders. She doesn't mention a source for this assertion, and doesn't explain it. And even if it were true, she would have to say what Prince2 means for the higher management, what kind of reports it should get and so on. Obviously, the higher management should at least check that the project leaders work professionally, and receive meaningful reports.

Schouten uses two arguments (tricks) to show that there is no need for action by uSG:

- “in Russia it is even worse”;³⁴
- “not I but somebody else should do something”.

Schouten commented on specific points as if she could speak for uSG. She denied incorrectness of the projects reports, with the possible exception of some PPP reports. Only the department of HE had

³¹ Reminder: HE= higher education, PAE= professional and adult education, PE= primary education, and SE= secondary education.

³² Jaco van Rijn, the representative of PE, had been contacted as well, but had not replied, and could not be reached in time.

³³ The mail can be found in the file CorrCfl_Overig_2008. Just like the reaction of Schouten.

³⁴ “Better than the worst” doesn't mean sufficient or good.

complained about incorrect reports.³⁵ She promised to discuss “the good suggestions” with IFC, but said it was too late to discuss them in the coming meeting uSG-top IFC.³⁶ She didn’t mention the next meeting of this kind. She promised to inform Van Velsen about the results. But she didn’t. And nothing changed.

Van Velsen didn’t leave it at that. He replied with a mail showing that Schouten could very well know that much more was wrong than the reports about the PPP, and that she elicited the suspicion that she tried to cover up malfunctioning.³⁷ It was misleading to suggest that only some of the PPP reports had been wrong: they had never been truthful at all. If only HE notices errors, that only goes to show that other departments fail to check the reports properly. Van Velsen gave examples of other incorrect reports, and examples of inconsistencies and obscurities. Such as the “ordering of the production process”. To support better information and management, he suggested to make a spreadsheet with all basic information about all projects, with links to the basic project documents and the progress reports. In such a way that everyone concerned could consult it/ them.³⁸ Without far better information, it will not be possible to correct the course of projects appropriately.

The next projects report, about January and February 2008, was discussed in the meeting of uSG with the top of IFC on 14/4/08. According to the report there were problems with the datawarehouse. The problems were not specified. It had always been said that the datawarehouse was part of the PPP. Just like Van Velsen, the representative of SE thought that only forceful intervention of uSG in the PPP could solve the problems. When De Hoog and Van Velsen were asked to comment on the new projects report, they pointed out that the situation around the datawarehouse was utterly unclear. The obscurity included the financial situation and the costs of the proposed solution. They requested uSG to demand clarification. In addition, Van Velsen repeated his requests concerning contents and structure of the reports. Neither request had a noticeable effect.

Monday 2/6/08 Schouten sent the departmental representatives the projects report about March and April 2008. She asked them to send her their comments on Thursday 5/6/08 at the latest. The meeting of uSG and the education DG’s with the top of IFC would be held on Monday 9/6/08.

Van Velsen wrote a more or less comprehensive comment.³⁹ It started with a review of earlier remarks about inadequate project documents and reports and the requests for improvement. It notes that the inadequacy of the documentation makes effective project management virtually impossible. It therefore proposed uSG to order the setting up of an information system about IFC projects. The system should be accessible for everyone in the ministry and IFC who is involved in these projects. The content of the documents should be improved in such a way as to make them useful for decision making in the meetings of uSG with the top of IFC.

The comment mentions the policy, public and parent portals, the information bank, the education number project and the datawarehouse as examples of projects for which the reports are grossly inadequate. Another project, “Facts and figures release 3”, is treated in some detail. It is recommended to stop this project for the time being. IFC should write a note describing and explaining the problems and possible solutions. Including consequences for timetable and finances. The future users of Facts and figures should be asked to comment on the note of IFC. Note and comments should be discussed, and a decision taken, in the meeting of uSG with the top of IFC of 9/9/08.

After observing that sometimes nothing is heard about the results of the meetings of uSG with the top of IFC, the comment ends with the request to be informed about what uSG or the meeting had done with the comment.

³⁵ If true, this can easily be explained by the fact that everybody knew from experience that such complaints are useless, as amply illustrated in this and the preceding chapter. Van Velsen didn’t stop complaining because he didn’t want “not to be” (from “to be or not to be”), and because he wanted to compel actors to show their true colors.

³⁶ This is nonsense, because the progress of the projects is one of the few main topics of these meetings, and because of the well known instruction of uSG about Prince2 and section 4.8 of the PC. But if it were true, then she should conclude that IFC should submit the projects reports earlier, and ask IFC to do so. She didn’t.

³⁷ The mail can be found in the same CorrCfl_Overig_2008.

³⁸ That is: by intranet or a shared hard disc.

³⁹ The mail with the comment can be found in CorrCfl_Overig_2008.

Schouten replied the following day.⁴⁰ On the basis of an argumentation which was inconsistent with the facts and internally, she concluded that the format of the projects reports was adequate, although minor improvements might be useful. She called the idea of an information system about the projects “very good”. She said she would ask IFC to work out a proposal. She denied errors in the reports about the projects listed by Van Velsen. She said that only Van Velsen alleged that there were errors or other important inadequacies in the reports. She saw no need for the recommendation about Facts and figures release 3. She would not forward the request to discuss the subject in the meeting of 9/6/08.

In spite of the “very good”, no action was taken with respect to an information system.

The denial of errors in the projects reports made Van Velsen quite angry. To end this “discussion” he sent Schouten a mail pointing out evident lies and misleading remarks in several projects reports.⁴¹ To avoid being misunderstood he noted that he didn’t want to suggest that absolutely nothing goes well. Only that uSG and the departmental representatives are not informed in such a way as to enable them to evaluate the situation reliably, and that there is no open communication about the inadequate information.⁴²

In the meeting of 9/6/08 DGHPS was represented by Erik Martijnse, the head of the section Management of the department HE, and deputy head of this department. He was kept informed by Van Velsen. As a consequence the minutes of the meeting of 9/6/08 show some realism. Acting DGHPS noted that the people managing projects need comprehensive progress reports. For a number of projects such reports are not available. Moreover, for some projects it isn’t clear who in the ministry is involved or responsible. The projects reports should give the names of the principal contact persons in ministry and IFC. The head of IFC agreed. It was decided that the ministry will make an inventory of its information requirements, and together with IFC make a proposal for the inclusion of this information in the project(s) reports. Martijnse will take part in this process as representative of the education DG’s. The possibility of exchange of project information by means of a shared hard disc will be studied.

As from one of the following projects reports names of contacts were mentioned, but none of the other decisions was carried out.

The next meeting of uSG with the top of IFC would take place 9/9/08.⁴³ At that date, almost three quarters of the year would have passed. If nothing was done in the summer months, this time would have passed without any improvement of the project(s) reports. Fearing that nothing would be done if the pressure wasn’t kept up, Van Velsen wrote Schouten a mail pointing once more to the instruction of uSG of 30/11/07 and to section 4.8 of the performance contract. He asked Schouten to collect the progress reports of all projects, and to pass them on to the contacts in the ministry. Because of the meeting of 9/9/08 he proposed to ask IFC to send the reports Friday 22/8/08 at the latest.⁴⁴

Everyone Van Velsen spoke about an information system for the IFC projects as sketched above was positive about it. He inquired into the technical possibilities.⁴⁵ He found out that a hard disc won’t do, because there was no hard disc shared by the ministry and IFC. So it had to be an intranet or internet application. From work on information management some years ago he knew that there was a government website where employees of all ministries could make and use “collaboration sites”.⁴⁶ A collaboration site is a collection of web pages that is accessible (only) for members: ministerial employees on a list made by the administrator of the space. The space is provided with applications

⁴⁰ The mail can be found in CorrCfl_Overig_2008.

⁴¹ In the directory of this chapter, under 20080613.

⁴² The mail had its intended effect: Schouten stopped claiming correctness of the projects reports.

⁴³ And the first one after that in November.

⁴⁴ Most ministerial project representatives had only seen the micro progress reports. Knowing the situation, this made it highly improbable that comprehensive reports existed for the projects of these contacts.

⁴⁵ The help of people from the information policy department is gratefully acknowledged.

⁴⁶ The ministries paid a yearly contribution for this.

which enable collaboration and information sharing. Members can place documents in the space and work on them. The application keeps track of who wrote or changed what and when. There are mail and agenda applications adapted for use by a group of collaborating people.

Both ministry and IFC had access to the system. To see whether it was not only a nice idea but useful in practice, Van Velsen made a trial space for IFC projects. For each project he made a directory. In the directories he copied the documents he could find. The conclusion of the test was positive: it could be done, and was relatively easy.

The chapter on the PPP has reported about the first part of a meeting of uSG with Van Velsen on 19/8/08.⁴⁷ The meeting took place after complaints by Van Velsen about the fixing of the plan for audit 3 of the PPP. When the discussion about the audit was finished, he drew attention to the management of IFC and the progress reports of the projects. Van Velsen told uSG that he had asked Schouten (who had just left the ministry) on 25/7/08 to collect the progress reports of all running IFC projects, and to do this in time for the meeting of uSG with IFC on 9/9/08. Schouten had replied that she would leave the request to be handled by her successor. Van Velsen reminded uSG of her instruction of 30/11/07 to adopt Prince2. He wasn't interested in the letter but the spirit. Because of the importance and clarity of Prince2 he had made the reports his spearhead. At his request a section on this subject had been inserted in the performance contract 2008. He noted that comprehensive reports are necessary to check the micro reports. uSG remarked that the projects reports were always too late. They should be timely; otherwise her meetings with IFC should be postponed for one or two weeks.

In this meeting of 19/8/08, uSG acted defensively. She tried to excuse herself. She was very critical of her meetings with the education DG's and the top of IFC. She said that her possibilities were very limited. She said she had difficulties with the distribution of duties between herself and the DG's. In case of problems, the DG's rarely reported them. If the DG's didn't report them, there was nothing she could do. This was obvious nonsense. Van Velsen noted that the minutes of the meeting of 11/2/08 show that the Education Supervisor asked for a progress report about the parent portal project.⁴⁸ The responsible DG, Kerstens, was present. But he said nothing. The minutes say that the staff of uSG will try to find out. Half a year later there was still no report.

The remarks of uSG about the distribution of duties between herself and the DG's contradict statements she made in her farewell interview with the magazine of the ministry.⁴⁹ She had been manager of the change program Apollo.⁵⁰ In that connection and together with SG Van der Steenhoven she had introduced the "SG-DG-model".⁵¹ According to the interview «[This clarified who is responsible for what](#)».

Roos had been uSG since february 2005. If responsibilities were not sufficiently clear, she could and should have done something about it.

The discussion of 19/8/08 incited uSG to order a meeting of representatives of the ministry and the contract manager of IFC, Frank van Loon. The meeting took place on 22/8/08.⁵² The resolutions of the meeting can be seen as implementation of the instruction of uSG of 30/11/07 and section 4.8 of the PC. They were supplemented by an agreement about the setup of an information system accessible for both ministry and IFC. The comprehensive monthly progress reports of the projects would be made available through this system. Until the system was working, IFC would send the reports to Bhim Mahabier for distribution in the ministry. A proposal for the digital system would be written by Van

⁴⁷ The only other person present was Nico Slooff, financial assistant of uSG. He filled the gap between the departure of Schouten and the arrival of her successor Faïrouz ben Salah.

⁴⁸ In the directory of this chapter, under 20080211.

⁴⁹ The magazine is called "Punt". The interview in "Punt.08.2009" can be found in the file with date 20090900 in the directory Integrity.

⁵⁰ In 2004.

⁵¹ The model is described in section 4 of the "100 days plan" of Van der Steenhoven, in the directory of this chapter under 20031210.

⁵² Minutes written by Bhim Mahabier can be found in the directory of this chapter, under 20080822. Mahabier worked in the financial department (of the ministry of education). Together with Slooff he was involved in the financing of IFC.

Velsen.

Some days before the meeting, Van Loon had sent the participants of the meeting the projects report of May-July 2008.⁵³ Beginning with this projects report some changes were introduced:

- the state of a project is summarized by three traffic lights: for quality, time and money;
- the names of the two main representatives are given: one for the ministry and one for IFC;
- it notes whether or not there is a more comprehensive monthly report for the project.

Although more comprehensive reports were submitted for only 9 out of 22 projects, and this only once, in all micro project reports except one it is said that there is a monthly progress report.

Sometimes it is said that the “frequency depends on developments”, or that it “will be made”. In both cases the micro report should have said: “No”. The exception is the micro report of UO Accounting. It promises: “As from September”.

In preparation of the meeting of 22/8/08 and the meeting of uSG with IFC of 9/9/08, Van Velsen called on all project contacts in the ministry. He asked them whether the micro project reports had been discussed and agreed with them, and whether they knew of more comprehensive reports. All contacts answered both questions in the negative. At least for a year they hadn’t seen anything more comprehensive. For this reason Van Velsen was quite astonished when in the meeting of the 22nd he heard Van Loon saying- without the least trace of uneasiness- that the micro reports had been discussed and agreed with the contacts, and that comprehensive reports were available for all projects. Because he found this lying unacceptable, and wished to talk about the information system, Van Velsen asked Van Loon after the meeting for a date to talk things over. Van Loon agreed.

This meeting under four eyes took place in the cafeteria of the IFC building in Zoetermeer (Netherlands), on 10/9/08. It was the day after the meeting of uSG with the top of IFC, including Van Loon. In the preparation for the meeting it had become clear that there were progress reports for at most 9 of more than 20 projects. In other words: in the meeting of the 22nd of August Van Loon lied about this, and thereby prevented discussion of the problem. Van Velsen told him that he had furthermore found out that the (micro) reports had not been discussed with the project contacts in the ministry. That Van Loon had lied about that too. Van Velsen said he hoped that this would not happen again. When Van Loon admitted his lies, no muscle in his face or change of color betrayed shame or anything special. He said that the missing reports would be made and sent as soon as possible. (They never came). Regarding the digital system for project information Van Velsen described his successful test with the collaboration sites on the government website. Van Loon had “only one point of doubt”: he was afraid that the documents would be seen by the wrong people. He wanted to guard access very carefully. He wasn’t able to motivate or specify this fear. Van Velsen didn’t understand. He noted that access was limited to selected people. This didn’t reassure Van Loon. But he said he would defer to the decision of uSG. He moreover wanted to discuss the proposal with Ben Salah, the successor of Schouten. His doubts were quite remarkable, because both Van Loon and Ben Salah were present at the meeting of uSG with IFC the day before. The system had been discussed and agreed on, and the minutes say nothing about doubts. Van Loon didn’t refer to the meeting of the day before in any way whatever. Regrettably, Van Velsen hadn’t seen the minutes.⁵⁴

The fear simulated by Van Loon contradicted the pretended efforts of IFC to become more transparent. These efforts are proclaimed in a special section “Transparency” in the preface of the performance contract 2008: [**«the transparency between ministry and IFC should be further improved and professionalized».**](#)⁵⁵

In the ministry, everybody was positive about the digital information system for the projects.⁵⁶ Except Ben Salah. She didn’t have any clear objections, but “found it difficult”. To allay fears of user(un)friendliness, Van Velsen proposed a demonstration. It was given on 3/12/08. (Time goes on!). It was attended by Ben Salah and Slooff. The demonstration convincingly showed how simple it was.

⁵³ Without the section about the financial situation. In the directory of this chapter under 20080828.

⁵⁴ He received them only much later. They can be found in the directory of this chapter, under 20080909. The minutes approved the format and contents of the projects report for May-July 2008. The report should have the approval of the project contacts of the ministry.

⁵⁵ The PC is in the directory of this chapter. Of course, the quoted sentence can also be interpreted cynically

⁵⁶ At least said so.

Neither Ben Salah nor Slooff voiced any problem. But Ben Salah still didn't know what to think of it. She promised to think about it. She never informed Van Velsen about the result of her thinking. And he stopped asking. In his opinion, the information system was primarily the responsibility of other people, who should translate their responsibilities in appropriate actions. He moreover realized that the system couldn't work if it wasn't actively supported by the management. Which it clearly wasn't.

Until the realization of the digital project information system, IFC had promised to send the comprehensive reports at least a week before the meetings uSG-IFC to Bhim Mahabier of the ministry.⁵⁷ This was done only once, and only partially at that. Namely for the meeting of 9/9/08. Van Loon sent them on the 4th, later than promised, and too late to be taken into account in the preparation of the meeting of the 9th. Van Velsen wrote to Ben Salah to record the main facts. He asked her to tell uSG that IFC had sent a comprehensive report for less than half of the projects, and later than promised. In the interest of management and transparency he advised uSG to request IFC to normalize the situation as soon as possible.

The minutes of the meeting of the 9th say nothing about the comprehensive reports.⁵⁸

3.4. The projects reports and the merger of IFC and IAG into NEA.

In 2009 the reporting about the projects changed. This was due to the merger of IAG with IFC. The merger was accompanied by changes in management, including procedures. The changes in the reporting can only be understood in the light of the merger. Apart from this, the merger can be seen as a project of a special kind, and as such a useful addition to the collection of projects reviewed in this chapter.

The earliest mention of the idea of a merger of IAG with IFC is found in documents from the beginning of 2007. On 11/4/07 the Supervisory Council of IAG is asked what it thinks about the relation between the renewal project and collaboration with IFC. «[The Council replies that cooperation should take place on the basis of choices](#)».^{59, 60}

In spite of the mutual respect, openness and transparency prescribed by the code of conduct of the ministry, the idea of a merger can at most have been discussed in a very small circle. It was never discussed with the people working with IAG or IFC on a regular basis.

The agreement about the (contractual) relations between ministry and IAG and IFC before the merger dates from 2003. At that time, SG Harm Bruins Slot replaced the centralized management of IAG and IFC by more decentralized management. The departments using the services and products of the agencies got a more prominent role and responsibility. In particular in the formulation of the performance contracts. For each department the PC got an appendix specifying the services and products to be delivered in the given year, and the budget which the ministry would make available for them. The projects were mentioned too, but only roughly. Details were left to specific project documents.

In general the departments were happy with this arrangement.⁶¹ They didn't want to return to the situation of before 2003, which was characterized by little contact between those doing the work and the people it is done for. And whatever one may think of the arrangement: the merger and management changes were not based on any evaluation. No evaluation has taken place. Reasons for the merger cannot be found in the documents. Sometimes one heard vague talk about a "Voigt advice". But the author has not been able to find a document that one could refer to by such a name.

⁵⁷ According to the minutes of 22/8/08, in the directory of this chapter, under 20080822.

⁵⁸ As noted before, the minutes can be found in the directory of this chapter, under 20080909.

⁵⁹ Rather cryptic indeed. Regrettably, that's how it is.

⁶⁰ The document can be found in the directory of the renewal project, under 20070411.

⁶¹ Up to and including 2007 the contacts of IAG and IFC in the ministry met periodically with the assistant of uSG for IAG and/or IFC. In one or more of these meetings the arrangement has been evaluated (informally). (A long time before the merger). Nobody saw a reason for change. The appendix of the PC of IFC for the department of HE was called "service agreement". When this service agreement had to be abolished in 2010, both HE and IFC saw this as a problem. It is simply convenient to have your agreements recorded somewhere for future reference. Trouble is much more likely if you don't have a document like a service agreement or PC.

He came closest with a section “Summary of Voigt advice” in a paper “Policy and implementation: follow up of the Voigt advice”.⁶² The summary only concerns the management of agencies by the ministry. Not the merger. There is no trace of argumentation or weighing of costs and benefits.

Both what can and cannot be found calls forth doubts about the wisdom of the merger and the other changes. No reasonable grounds can be found. No mention is made of problems to be solved.⁶³ Only minor efforts are made to show that a merger has benefits. The available documents show no trace of documents with substantial argumentation. Nothing contradicts the hypothesis that thinking only started at the end of 2008, and that up till then there was no more than the idea of a merger and the decision to merge IAG and IFC.

The situation can be inferred from a presentation given at a meeting on 4/12/08 of the management team of the ministry (MTM) with the management teams of IAG and IFC, and from the minutes of this meeting.⁶⁴ There was no discussion about the merger. The discussion was about the relation between the ministry and the merged agency. The merger was accepted as a matter of fact, as a premise. Beside the absence of any reference to inefficiencies or problems that could motivate a merger, one is surprised by the fact that “image building” is one of the six chapters of the presentation. As if the image is more important than reality. The minutes suggest that the presentation was based on no more than interviews. The absence of references to an evaluation is compatible with the hypothesis that no serious research was done, and no serious analysis made. In fact it would have been difficult to assert that IAG or IFC had not been functioning properly. That could not have been tallied with the appointments of for example Kerstens, Van Lochum and Van Loon in top positions of the New Education Agency (NEA). These people had long been responsible for IAG and IFC.

The conclusions of the meeting of 4/12/08 were discussed in the meeting of the MTM of 12/1/09. It decided that NEA will be an agency of the ministry, that its head will be a DG (“DGNEA”: Kerstens), and that as from 1/4/09 DGNEA will be a member of the MTM. The duties of uSG with respect to IAG and IFC will be split. The management part will go to the SG, and the policy part to the MTM. The periodic meetings of uSG with the top of IAG and IFC are replaced by a periodic discussion of one hour monthly by the MTM.⁶⁵

DGNEA was asked to develop a proposal for the practical implementation of the new relationship and procedures. He would be advised by Ruud Voigt (and as many other people as he wanted). The result was the paper “Policy and implementation: follow up of the Voigt advice” mentioned earlier. It was discussed by the management team of the ministry on 9/2/09.⁶⁶ The team was asked to approve:

- The first elaboration of the different subjects;
- The terms of reference for a set of working groups;
- The proposals for the process.

The team approved.⁶⁷

A following version should have been made, but could not be found.⁶⁸

In the meeting of the MTM on 6/4/09 Voigt gave a presentation about the different roles played and to be played with respect to NEA by people in the ministry.⁶⁹ Voigt presented the results of an inquiry that Bob Fuchs and he had made at the request of the MTM. The inquiry consisted of interviews with people in the ministry. Fuchs and Voigt found that much goes well, but that attention is given mainly to what doesn't. In the ministry, many people are involved in work of the agencies.

⁶² MTOCW 90114, included in the directory of this chapter, under 20090209.

⁶³ Of course there may have been unmentionable perceived problems, such as dysfunctional groups of people. Since dishonest people with proven management incompetence were placed in the top of the merged organization, and since the results show that the merger made things worse (in agreement with the first observation), it seems meaningless to try and rationalize the process. (In terms of accountable reasons that is).

⁶⁴ In the directory of this chapter, under 20081204.

⁶⁵ The MTM met weekly. In other words: in one meeting per month an hour is reserved for NEA.

⁶⁶ The minutes can be found under this date, 20090209, in the directory of this chapter.

⁶⁷ With one reservation: it requested DGNEA to clarify the role of the finance department of the ministry, and to make better use of the capacity and know how of this department.

⁶⁸ In particular, it was not found among the documents of the MTM.

⁶⁹ The following is abstracted from the minutes of this meeting. The minutes can be found in the directory of this chapter, under 20090406.

But their knowledge of the agencies is limited. They have serious doubts about price, quality and correctness of data provided by especially IFC.

The recommendations to improve the situation stress reciprocity: people in the ministry should learn more about the work of the agencies, and people in the agencies should learn about policy. The MTM assumes responsibility for this process.

Reciprocity should also characterize the improvement of the process leading to the work portfolio and the performance contract. For this subject there will be one contact on both sides.⁷⁰ NEA will get a director Policy and Implementation,⁷¹ and the ministry a program manager order portfolio. The last function was said to be needed for two years only. The manager order portfolio should professionalize the process, and make himself redundant, or at least reduce his job to such an extent that the remainder can easily be taken over by the SG. He should present a plan for his work to the MTM.

DGNEA is to improve the quality of the work of NEA. In the first place by quality improvement in the direct sense, and in the second place by harmonization (or simplification) of regulation within the given policy framework. He is to submit a plan for this to the MTM.

There is no indication for other support for the recommendations than opinions expressed in the interviews. Even though in the meeting of 4/12/08 it had been noted that «the picture presented is derived from opinions of participants. This should be a reason for carefulness. There is a dangerous risk of generating your own problem. Objective, empirically supported findings are not presented»⁷².

With regard to the relation between ministry and NEA, SG and MTM chose what can be called a revolutionary approach. The old ways were wrong and are thrown overboard. We know better, and replace everything with what we know to be good. In general, as in the present case, such claims are not supported in any reliable way. In general there is no reliable (empirically tested) theory to support the changes. Neither are there truly comparable situations where the changes work as supposed to. If no open discussion is permitted, as in this case, every set of proposals can be defended by simply ignoring costs and disadvantages, and by prohibiting comparison with other proposals.

The revolutionary approach is the opposite of the incremental approach, where relatively small changes are made on the basis of experience, reasoning and trial and error, and in such a way as to be able to modify or undo them at low cost.

We now show how the reorganization affected the reporting about projects.

Already in the performance contract (PC) for 2009 a section about project management or something similar is missing. Section 4.8 from the PC 2008 has been deleted. PC 2009 says the following about the reporting:

«3.1.5. Reports and (performance) indicators.

IFC reports about work done and performance. Performance is measured with the performance indicators mentioned below.

Until April 1, 2009 there are two lines of reporting:

- By projects reports: reports with highlights and exceptions. Beside current projects the reports present projects to be approved and proposed in 2009;
- By progress reports uSG: reports about the execution of the PC, in particular about expenditure.

As from April 1, 2009 the management model is changed. The SG will assume the role of formal commissioner for NEA. In practice the management part of the role formerly played by uSG will go to the SG, and the policy part to the MTM. Details and the way of reporting will be worked out by NEA in collaboration with the ministry.»⁷³

For IAG the changes were similar. As a consequence, the report of IAG about January-April 2009

⁷⁰ This may be presented as something new, but it wasn't. The new arrangement cannot work better, because the central contacts can only have (very) limited knowledge of often specialized and technical work being done for specific departments.

⁷¹ There was already such a functionary, Jacob Smit.

⁷² Minutes of the meeting of 4/12/08. In the dossier under 20081204.

⁷³ PC 2009 can be found under 20090324 in the directory of this chapter.

was the last one sent to the department of HE.⁷⁴ The last analogous report of IFC concerned October-December 2008. Nevertheless, the performance contracts for both IAG and IFC for 2009 still had departmental appendices. The reports were abolished on instructions from the SG.⁷⁵ A reason for the abolition of the reports wasn't given. The abolition is obviously incompatible with professional (good) management.

As from 2010 the two performance contracts (with IAG and IFC) were replaced by one management agreement (MA, with NEA). With respect to the reporting, the development begun in the PC's for 2009 was continued in the MA for 2010. Words like "project management" and "Prince" cannot be found in the MA. About the reports, p. 39 says the following:

«Reporting structure.

Between NEA and the ministry the following reports exist:⁷⁶

- Management reports
About the realization of the agreements in the MA. For the 4-monthly talks of DGNEA and the SG. The 3rd report is the annual report;
- Monthly reports for the MTM.
About the cooperation policy and implementation, exceptions in agreements and signals about the work of NEA.
- Specific information for policy departments.⁷⁷
There will no longer be reports about the work for specific policy departments. The same information elements will be made available in the format of information services.

Information disclosure.

Within the ministry the binding rule is that all information which should be supplied in case of an appeal to the law about the accessibility of public administration documents, is public. In other words: "information is public unless". NEA actively publishes information which is relevant for education, unless other agreements have been made.⁷⁸

In the list of types of reports the quarterly report about risky projects is missing. But they were still made, and submitted to the MTM.⁷⁹

In practice the third point meant that no information was given at all.

The abolition of the reports for the policy departments was coupled with the abolition of the periodic meetings department-agency about the realization of the PC. From 2009 on there were only ad hoc meetings, which obviously couldn't be supported by the reports.

The reality behind the "public unless" is very different from what the text suggests. The reality is that one could only see what one managed to find. Even after the introduction of the digital archiving system Edoc, there was no public hard disc and no transparency.⁸⁰ ("Public" and "transparency" in this case referring to the ministry only). For example the management reports of the first point were

⁷⁴ IAG sent three reports a year, each reviewing a period of four months. They were called the 4-month, 8-month and 12-month reports.

⁷⁵ This bit of information is based on informal communication with the present author. The abolition wasn't even formally communicated. People were surprised when the reports didn't come around the time they normally came.

⁷⁶ The rather strange language is adopted from the original.

⁷⁷ The concept "policy department" is somewhat wider than "education department". It includes for example the department of science policy and that of emancipation. These departments do not only make policy, but also laws, and they are also responsible for the financing of students and institutions such as schools and research institutes. They prepare the budget law.

⁷⁸ The MA 2010 can be found in the directory of this chapter, under 20091217. The MA was signed in 2009 before it was ready, because the SG wanted it to be signed in 2009. As a consequence it contained many ambiguities and errors, and had to be corrected in many places. SG should have started the process earlier, and managed the process more closely and better. (If he could).

⁷⁹ They can be found in the directory Project reports. The report about the 3rd quarter of 2009 is missing because I couldn't find it. I may never have received it, possibly because it was not made.

⁸⁰ Before Edoc, each of the departments had a separate disc (or partition) for its employees.

nowhere to be found.⁸¹

As noted earlier, from about the middle of 2009 one hour of one meeting of the MTM per month was devoted to NEA matters. The monthly progress report was a standard point of the agenda. In the beginning of a quarter the report about the risky projects in the preceding quarter was put on the agenda. The reports and the accompanying discussion papers went to the MTM via successive meetings of groups “information and implementation” at two levels. The low level “working group i+i” and the higher level “strategic council i+i”. The last was chaired by the SG. The groups could request changes in the reports and accompanying papers. Ultimately only the SG could be held responsible for the text submitted to the MTM.

3.5. Continuation of notes about specific projects.

Introduction. The program User Oriented Services 2.

This section gives an impressionistic picture of the evolution of selected projects, as it emerges from progress reports and other documents. The only criterion for the selection of a project was active involvement of the present author. The involvement may have been little more than a request to advise a DG or the uSG, and/or information of colleagues. In other words: no systematic study has been made of the progress of all (current) projects. Neither have the selected projects been studied in detail. The main purpose of the inquiry was to check the picture that had arisen from the policy portal project. Because his involvement was accidental, the author considers the selection representative. On 1/1/08 he became representative of HE for IFC, and on 1/8/11 he retired. These dates define the approximate boundaries of the timeframe of this section.

The project policy portals was part of the program User Oriented Services (UOS). UOS was followed by a program Rounding off UOS, shortly UOS2. As with many names in politics, the name of this program should not be misunderstood: there was customer orientation before UOS. And whatever its intentions, UOS2 didn’t round off or complete the projects of UOS. The policy portal project was far from completed. But it was not included in UOS2. The policy portal project moreover shows that the user orientation is not to be taken seriously.

In 2007 IFC had budget problems, and ideas for several new ICT projects. IFC told the ministry that these projects could realize the efficiency improvements needed for structural budget reductions.⁸² The reductions were imposed by the government, with approval of parliament. Even though they never checked whether IFC could accomplish its tasks properly with the given or less money. The paper of IFC about the financial problems and their solution, the *Notes of the mini-taskforce financial framework IFC*, suggests that UOS2 was meant to address the financial problems in the short as well as longer term. The budget for UOS2 was 9.5 M€. This was for 2 years,⁸³ and can be compared to IFC’s annual budget for “going concern”⁸⁴ of 48 M€.⁸⁵

The paper, an agreement of 13/11/07,⁸⁶ and the letter of uSG permitting IFC to carry out UOS2⁸⁷ assume that all products of the program will be completed in 2009. The letter asks IFC to submit the PID’s, i.e. more detailed plans, for UO Financing and UO Digitizing in resp. January and February 2008.⁸⁸ The letter does not mention UO Accounting explicitly.

⁸¹ Some colleagues thought that the changes in the reporting were made to get rid of the critical commentaries of the present author.

⁸² See the file “20070906_Notitie mini-taskforce financieel kader Cfl” in the directory of this chapter.

⁸³ 2008 and 2009, see the “Notitie mini-taskforce financieel kader Cfl” mentioned before.

⁸⁴ That is: excluding projects. For this classification of costs see PC 2009 p. 12. The PC can be found in the directory of this chapter, under 20090324.

⁸⁵ See PC 2009.

⁸⁶ See the file “9,5_M€voorSU_komende_jaren.htm” about the signing of this agreement (“convenant”).

⁸⁷ This is the file “20071113_Brief pSG aan HDCfl met opdracht voor SU2.pdf”, in the directory of this chapter.

⁸⁸ Reminder: PID= project initiation document.

The notes on the following pages frequently refer to reports submitted to meetings and to minutes of meetings. The reader may be surprised about the passivity of the meetings and their participants, and the lack of action where action is clearly required. Without suggesting that it explains or excuses the passivity, it should be noted that the meetings (the group of people present or represented) are never formally responsible. Only the SG (Van der Steenhoven) or uSG (Roos) is formally responsible. Informally the responsibilities of meetings and their participants may be considered proportional to the openness of SG and uSG; their receptiveness for criticism. In this regard, the situation under Van der Steenhoven and Roos was clear: they didn't accept criticism, even though they tried to create an appearance of openness. There was a repressive instead of open atmosphere. And if this doesn't excuse the inaction of other people, it certainly makes the SG much more responsible for what the ministry and its agencies did and did not.

In addition it should be kept in mind that the participants of all meetings mentioned in this chapter are more or less dependent on the chairperson and/or (u)SG. Both with respect to their work and their career.

Beside the meetings there is always a hierarchical line procedure. The line procedure was formally independent of the meetings (and conversely). Only in the line procedure documents are initialed; and only initials validate documents. There was no clear, let alone formal, coupling of the line procedure with meetings. No significance can be attached to the apparent agreement between opinions expressed in a meeting and the decision of (u)SG. In general people only express opinions which they think will be welcomed by (u)SG. The more so if SG and/or uSG have somehow shown that they have a dislike of certain types of remarks. Never make the mistake of thinking that decisions are taken democratically, or that a ministry is a democracy.

The roles of SG and uSG until and after 1/4/09 are described in section 2.2, Framework, of the PC 2009 of IFC.⁸⁹ It distinguishes three responsibilities:

- «Commissioner: only uSG is formally responsible for the activities of IFC and for the costs of its activities;
- Delegated commissioner: DGPS, DGHPE, uSG,⁹⁰ SG, and ES⁹¹. They are responsible for the contents of the activities of IFC and for the payment of the costs of these activities;
- Agency head: the head of IFC, responsible for the management of the agency and the financial results.

As from 1/4/09 the SG becomes commissioner for IFC. After 1/4/09 “uSG” should be read “SG”».

The distribution of responsibilities (duties) between (u)SG and DG's is therefore unclear. Although it is clear that the “delegated” implies that the (u)SG can always sidetrack the DG and assume full responsibility. It is furthermore clear that the DG's should keep themselves well-informed about the activities they are supposed to pay for. And shouldn't keep silent when these activities are not carried out properly.

Before the merger, IAG and IFC seem to have had a formally different status. This may explain the fact that the PC 2009 for IAG only mentions uSG, calls her the representative of the minister, and doesn't mention the SG, DG's and ES.

We now turn to some individual projects.

UO Financing.

The project proposal describes the purpose and goal as follows:

«The program⁹² financing under architecture implements user oriented financing of the sectors SE, PAE and HE. [...] The program realizes full adjustment of the components and the addition of extra functionality, so that regulation applicable to SE, PAE and HE can be implemented through the

⁸⁹ In the directory under 20090324.

⁹⁰ In those cases where there is no other delegated commissioner.

⁹¹ ES = Education Supervisor.

⁹² Sic. It would have been more consistent or correct to use the word “project”.

components».⁹³

In the course of the project four PID's were written. To wit: SE 28/4/08, SE additional 20/10/08, PAE 11/11/09, and HE 22/2/10.⁹⁴ The timetable of the letter of uSG was exceeded by more than a year. The PID for HE was not submitted in February 2008, but two years later. The PID's clarify purpose and result. Even though they do not- for example- sketch the initial situation, and describe what has to be done to realize the final situation. It is unclear how realization of the promised result can be verified. The PID doesn't include an acceptance procedure. A lot of testing has been done nevertheless. According to the documents the project produced well working systems.

The documents suggest that the project tried to rebuild (hard- and/or software) systems in a more logical, uniform and flexible way, and to adapt them to new and/or coming regulation.

UO Financing was managed in a far better way than all other projects known to the author. The project documentation was more clear and useful, and the informal delegated commissioner, Ron van der Meer, head of the section Finance of HE, hired external consultants to monitor the work of IFC critically. The consultants informed and advised him monthly.

UO Digitizing.

The proposal distinguishes three phases:

1. Digitizing information collection;
2. Digitizing execution;
3. Digitizing output.

For each phase some of the results are specified in more detail. Some seem to be verifiable. But only some, if only because the original situation is not described.

According to the proposal, phase 1 will be executed in 2008, phase 2 in 2009, while phase 3 should be completed in the summer of 2010. According to the financial section at the end of the proposal, the estimated total cost of the project is 3.5 M€.⁹⁵

The questions and comments in the following paragraphs come from a mail which Van Velsen sent to uSG assistant Ben Salah in answer to her request to comment on the projects report for October-December 2008.⁹⁶ He found the statements on UO Digitizing in this projects report puzzling, and tried to get more light by comparison with earlier projects reports and the project proposal.⁹⁷

The projects report about November-December 2007 reports that the project proposal has been approved. The projects report for October-December 2008 implies that a year later there still is no PID.⁹⁸ Are purpose and results still to be specified? Why does this take so long? Why is no mention made of contact persons in the ministry?

On p. 6 of the projects report about August-September 2008 one reads the following:

«The functionality of an electronic post office which can receive the e-forms is realized by extension of an existing solution. This should require a minimal effort.

The present authorization tool of IFC turns out not to be suitable for e-forms. IFC begins with a project to develop a new authorization tool. This development takes place in IFC.nl and therefore falls outside the scope of the project digitizing.

The training of the form makers and administrators has begun. After the training the development of the first two forms will be started in collaboration with ICTA.»^{99, 100}

This suggests that the project was begun without sufficient knowledge of what is to be done to

⁹³ From the proposal for UOS2, in the directory under 20071107.

⁹⁴ All of them in the directory, under the dates given.

⁹⁵ 20071107_Offerte afronden SU_def, p. 12 (timetable) and p. 17 (costs).

⁹⁶ The mail is dated 6/2/09, and part of CorrCfl_Overig_2009.

⁹⁷ All documents mentioned can be found in the directory of this chapter, or its subdirectories.

⁹⁸ P. 6 of the projects report October-December 2008, in the directory Project reports, under 20090206.

⁹⁹ ICTA= ICT Agency, a government agency. (= ICTU, ICT Uitvoeringsorganisatie).

¹⁰⁰ According to the project proposal, the project would be regauged 1/9/08. Why is the projects report for August-September 2008 silent about that? (This remark was included in the mail of Van Velsen to Ben Salah).

realize the desired goal.

On p. 6 of the report about October-December 2008, one reads:

«**Most requirements and wishes of the Program of requirements for the e-forms are fulfilled.** However, three requirements and eight wishes are not fulfilled yet. Solution of this problem is necessary for realization of the goal of the project. The findings have been submitted to ICTA for an answer.¹⁰¹ As a consequence the timetable has to be adapted. The reaction of ICTA will show whether we can go on with the e-forms and at what costs in terms of money and time.»

How is it possible that these problems were not discovered earlier? (Answer: Because no feasibility study had been made). How can the traffic light for finances show green if extra money is necessary, and the amount unknown?

The report continues:

«**ICTA answers 14/1/09. In the week of 23/1/09 the internal steering committee will be advised about the continuation of the project Digitizing.**

The projects report is dated 4/2/09. The problems and risks clearly are substantial. Why has the text of the micro report for this project not been supplemented by a summary of the answer of ICTA and IFC's conclusions? Discussion in the meeting of uSG with the top of IFC (on 11/2/09) seems to be necessary, but can only be meaningful if more information is provided.¹⁰²

Ben Salah didn't answer. Neither did she send the minutes of the meeting of uSG with the top of IFC for which the questions and comments were supplied.

The projects report about October-December 2008 was important for another reason as well. The agreements of August and September about the reporting seemed to have been forgotten already. In addition, two more formal documents, PC 2008 and the memorandum about Prince2, ask for monthly reporting about the projects. But on p. 3 of the projects report it is said that in the micro reports (in the projects report) it is indicated whether it has been agreed that a more detailed monthly report for this project will be made. As if one would be free to choose, and as if such an agreement had not been made already. The remark on p. 3 is no more than a misleading way of saying that the agreement about the reporting will be ignored.

The story of UO Digitizing is continued in a mail of half a year later, with a reaction on the progress report IFC for May-September 2009.¹⁰³ The mail reflects the regress in the information of the ministry in general and the policy departments in particular. The mail furthermore shows that the lack of supervision by the ministry has enabled NEA to swindle the tax payer out of an amount of 400 k€.

As representative of HE Van Velsen says to miss the reports about the execution of the parts of the PC concerning higher education and HE. These reports gave much more information than the new ones. He reminds Ben Salah of a promise she made in the beginning of 2009. She promised that the abolishment of the reports for the policy departments would be compensated by an expansion of other reports. But none of the present reports is more comprehensive or informative than those of a year ago. They don't solve the information problem. In Van Velsen's opinion, the information deficiency hampers the supervision of NEA by the ministry. Effecting timely changes becomes more difficult and sometimes impossible. He therefore asks Ben Salah to advise the SG to reconsider the ways of reporting.

The mail gives several examples of inadequate reporting. For the sake of brevity only two are mentioned. The first concerns a project "stabilizing components". According to p. 22 of PC 2009 it has a budget of 3.85 M€. Three sections of the report are devoted to this project. The sections on pp. 4 and 27 are short and almost identical. Appendix 3 gives more details. The texts are full of pretensions, but don't tell the reader what it is all about. They don't explain the significance for other IFC systems or activities. Nothing is said about the timetable and expenditures. The significance of the project could possibly be shown if IFC (or NEA) had a 4-year plan, and indicated the position of the project in that plan. In other words: the problem isn't restricted to this particular project, but concerns the

¹⁰¹ This cryptic sentence probably reflects truths which cannot be expressed without betraying gross errors.

¹⁰² The mail of Van Velsen to Ben Salah is dated 6/2/09. It can be found in CorrCfl_Overig_2009.

¹⁰³ In the directory under 20090929. The mail of Van Velsen is dated 13/10/09.

management of system maintenance and renewal in general.

The second example concerns the involvement of ICTA. It is discussed in the last part of the mail. This part dealt with UO Digitizing. It shows a contradiction in the documents about UO Digitizing. In appendix 4, Budget, of the proposal for Rounding off UOS¹⁰⁴ it is said:

«regarding the acquisition of an e-form provision we assume the ICTA solution. If this solution is not sufficient (yet), we will realize a temporary solution within the same budget (100 k€).»

The proposal doesn't mention any agreement with ICTA. It only says: "It is [several times] assumed that ICTA" etcetera. No mention is made of communication with ICTA, and no reason is given for believing that the assumption is realistic. The mail then asks how this state of affairs is to be tallied with the following paragraph on p. 31 of the present report:

«1. Due to the failure of ICTA to deliver a working solution as promised, IFC has to build [e-]forms itself. This causes a cost overrun of 500 k€ (already spent on ICTA).¹⁰⁵ ([The] Information [department] agrees with the contents of this proposal)¹⁰⁶

Van Velsen advised the SG not to approve the request for the additional 400 k€, to ask IFC when what agreements have been made with ICTA, and to submit documents to support the answers.

The mail concludes with a repetition of the request to let the sender know what has been done with his comments and those of his colleagues.

Ben Salah did not react.

The report about the risky projects for October-December 2009 is as vague as ever. Phase 1 doesn't seem to be completed:

«To relieve pressure on the organizations involved in the project it has been decided to distribute delivery of the digital forms over a number of releases. Delivery is adjusted to the natural dates for submission of these forms. The last set will be delivered 15/7/10».¹⁰⁷

Nothing is said about results of the phases 2 and 3. But 15/7/10 is still supposed to be the last day of the project. Under the heading "Money" the report states:

«In July 2009 a new PID has been approved. The costs of phase 1 of the project are 755 k€ higher than originally estimated. Partly due to extension of the scope, and partly because the ICTA e-form building block was not forthcoming».

The section about "I-principles" is the only one with a yellow traffic light (the others are green). The reason given is «that the UOS2 solutions may not be NEA-proof». This is explained as follows: «In order to make NEA sustainable, an agreement has to be made about the use of components which were used by the former IAG and the former IFC». In other words: the project had been designed without regard to circumstances before and after completion of the project. Of course, when uSG approved the proposal for UOS2 she (and those around her) knew that IAG and IFC were to be merged.

The report about the risky projects for April-June 2010¹⁰⁸ has a surprise: «Timetable: Phase 1 until 15/7/10. Preparations for phase 2 and 3 have begun». Even though the report about the 4th quarter of 2009 explicitly stated that the project would be finished 15/7/10 (in accordance with the original planning). The new report nevertheless says: «The project is executed in accordance with the agreed planning». And a little further on: «Phase 1 will be completed in June according to plan. These days the structure for administration and possible new e-forms is developed. The definition study for phase 2 will be discussed in June».¹⁰⁹

With regard to "Money" the report says that the «project is being executed within the agreed budget». But no financial account is given.

¹⁰⁴ Dated 7/11/07. The project proposal can be found in the directory of this chapter, under 20071107.

¹⁰⁵ The meaning of "(...)" is a mystery to me, i.e. the present author. The obvious interpretation, that this money has been paid to ICTA, seems impossible.

¹⁰⁶ There are more cost overruns; the total amounts to 1200 k€. See the same p. 31 of the progress report (Voortgangsrapportage PC) dated 20090929.

¹⁰⁷ See the directory Projects reports, under 20100118. The "organizations" probably include schools.

¹⁰⁸ To be found in the directory Projects reports, under 20100830.

¹⁰⁹ Note that an outside reader who gives the ministry the benefit of the doubt is completely cheated. The lesson is: never believe what you read, always check! The least you can do is compare.

The project is 2 years behind schedule. The report gives the impression that it is unclear for how long the (as yet hypothetical) results can be used. And therefore, whether benefits outweigh costs.

In the section about project supervision, the Information department requests transfer of the responsibility for the project to the department Concern Support (CS). This request is said to be motivated by the remark that in the phases 2 and 3 the internal organization of IFC plays a central role.

All traffic lights are green.

The report was discussed in the MTM of 30/8/10. In the minutes of this meeting nothing is said about UO Digitizing.¹¹⁰ This means that the proposals included in, or implied by, the report must be assumed to have been approved. This is confirmed by a remark in the section about the project UO Accounting in the report about risky projects for the 3rd quarter of 2010.¹¹¹ The remark asks attention for «the fact that the project Digitizing of UOS2 has stopped, and transferred to the line organization».

These are the last words about this project. In the meantime it is completely unclear what the last mentioned transfer means. To put it in perspective, it can be noted that IFC had tried to transfer the policy portals to the line organization at a time when the portals were still in the first stages of development, and completely useless.

UO Accounting.

The origin and beginning of this project in 2007 and the first months of 2008 have been sketched above. This section continues with June 2008, when Van Velsen and his colleagues of the other education departments were asked to comment on the projects report of IFC about March-April 2008.¹¹² In this report, the reports about UO Accounting and the closely related project SiSa were treated separately, without any indication of a relationship.¹¹³ The close relationship is clearly shown in the project proposal. On the basis of a suitable quote the comment of Van Velsen concluded that these projects and their financial aspects should be taken together.

Mails of Pio Tulp of IFC and of Schouten, both of 6/6/08, confirmed that SiSa HE is part of UO Accounting.

In the projects report about May-July 2008 SiSa isn't mentioned any more. It only mentions UO Accounting.¹¹⁴ The report says that in June the ministry has approved the PID. The PID is dated 4/7/08.¹¹⁵ It doesn't cover the whole project, but only the processing of annual accounts. The PID distinguishes four phases: Preparation, Design, Realization, and "Test and after-care".

The following quote from the projects report about the last quarter of 2008 is not only interesting in itself, but even more in comparison with reports of one and a half year later:

«Furthermore it has turned out that the release planning of components and the planning of the project don't fit any more. Everything is done to get realization as close as possible to the original planning (15/4/09). The impact will be discussed with the Steering committee.

In the OG-ON of 12/12/08 [that is: the meeting of uSG with the management of IFC] it has been agreed that [the department] Accounting organizes the process of getting the signatures of the education departments under the Requirements program (RP). The draft status of the RP is a risk for the project: every change may require extra work».¹¹⁶

The first paragraph shows that the project is delayed. But the report doesn't say by how much. From the second paragraph it follows that there is a (draft) RP, and that there is no agreement about it. Nevertheless the author of the paragraph doesn't want any more changes. He wants signatures. He doesn't say what the difference of opinion is about. And doesn't seem to understand that he doesn't show that the RP is right as it is. And that a lack of communicative abilities and an authoritarian

¹¹⁰ The minutes can be found in the directory of this chapter, under 20100830.

¹¹¹ This report can be found in the directory Projects reports, under 20101006.

¹¹² The report can be found in the directory Projects reports, under 20080602.

¹¹³ SiSa= Single information Single audit.

¹¹⁴ The report can be found in the directory Projects reports, under 20080828.

¹¹⁵ It can be found under that date in the directory of this chapter.

¹¹⁶ The report can be found in the directory Projects reports, under 20090206.

attitude towards users are important risks for a “user oriented” project.

The underlying problem was the lack of a description of the goals of the project in the PID. According to the delegated commissioner for the project, Anita Schilperoort, they would come in the RP. But they didn’t. It was completely unclear what was going to be done in this project. That’s why some departmental representatives didn’t agree.

The projects report for the 4th quarter of 2008 is the last report that gives the financial situation per project. It can be found in chapter 6 of the report. It says that of the 1864 k€ available for this project, 767 k€ was spent in 2008. It is useful to note the spending speed in order to evaluate the reliability of qualitative remarks about the financial situation in later documents.

According to the projects report about the 2nd quarter of 2009, there still was no agreement about the RP half a year later. The report tells of all kinds of changes in plans. It makes one wonder whether one knew what one wanted with this project when it was approved and started, and whether it is known by now. The last paragraph of the report reads as follows:

«The costs of the original project until the middle of 2009 are already about 1.2 M€. Large part of this has to be written off. However, part of the costs resulted in products which are also useful for the new approach. Only those costs will be charged to the project.»^{117, 118}

Even the information department notes that the text of the report is incompatible with the green traffic light under “I-principles”. IP concludes that one of the goals of the project, a sustainable accounting system, will not be realized. IP notes that there should have been a project start architecture (PSA, a document), and that this should be adjusted when necessary in the course of the project. For UO Accounting no such document had been made.

In this project the department of HE was represented by Pieter Veen. In a memorandum of 24/9/09 to the delegated commissioner of the project he sketched the history and problems of the project.^{119, 120} The memorandum was meant as a complaint, but also to inform the head of his section (Finance). The following gives an impression of the contents.

«In January-February 2009 the project was suspended because of insurmountable problems. The idea of the new architecture and use of components turned out to be infeasible. In August the sounding board group was approached about a revised project. On August 31 we have discussed the PID and part of the RP. Among other things, I noted lack of clarity about the products and finances of the project. I made suggestions for improvement. In the second meeting, last Tuesday September 15 [2009], I reiterated my objections, and indicated that more time is needed, for example to make a list of products. In reaction it was said, to my surprise, that product descriptions are being written. The next two hours were spent discussing the list of requirements in the RP. This cost a lot of time, but helped getting an idea of the list of products.

I see that a substantial effort has been made to keep track of changes in the RP and their motivation. Irrelevant requirements have been deleted, which is an improvement. At the same time a list of adjustments of the PID remains to be made. Together with other problems this problem seems to be structural.

The structural problem has the following elements, which I will explain below:

1. No mention of the products;
2. No picture of what will change in the relation between, and function of, systems;
3. The RP is a list of desirables which either have to be checked for feasibility, or are irrelevant;
4. The budget lacks substantiation;
5. There is no business case;
6. There is no sounding-board of education departments and no PSA;

¹¹⁷ The report can be found in the directory Projects reports, under 20090903.

¹¹⁸ Of course, everything is paid by the taxpayer. The suggestion that IFC pays something out of its own pocket is misleading nonsense.

¹¹⁹ The mail can be found in the directory of this chapter, under 20090924.

¹²⁰ “delegated commissioner”: delegated by, and representing, the Inspector-general (= the head) of the (organization for) Education Supervision.

7. The project is not XBRL-ready.^{121»}

The report about risky projects for April-June 2010 shows that the problems were not solved yet. It seems that the project was based on false pretensions, unfounded budget estimates, and, maybe mainly, the availability of money. The report says nothing about results. It does show that the project is in decay:

«On 29/6/10 the Steering Committee has decided that a new planning will be made. [...] The timetable is inelastic. The results may not be ready for the reporting about 2009.

Since the middle of May the project has a new NEA project leader. After a thorough evaluation, the new project leader has concluded that the project is on its way to exceed its planning by 4000 hours.¹²² This is caused by a number of factors, such as illness of the replaced project leader and incorrect estimates. In the Steering Committee of 30/7/10 NEA has indicated that the total calculated overrun for the project may amount to 8000 hours. By descoping phase 4 and tight project management the excess can be limited to 3400 hours. The costs will be fully born by NEA. [...]

Following the Steering Committee of 29/6/10 it has been decided together with NEA that the project will look for cooperation with UO Digitizing for elements touching that project. Talks with the commissioner and management of that project have started. A risk analysis for this scenario will be made. After approval by the commissioner on 3/8/10 phase 4 has been removed from the project. This means that some improvements for the reporting about 2010 will not be realized.»¹²³

The report about risky projects for April-June 2010 was discussed in the MTM of 30/8/10. The relevant section in the minutes reads as follows:

«UOS2 Accounting.

There have been thorough discussions with the Education Supervisor about this project.¹²⁴ Everything has been gauged anew. Some requirements have not been met, but agreements have been made about this. Frank van Loon (NEA) assures that the support of the education institutions remains ensured.»¹²⁵

In a formal note of 18/10/10 to the head of his department, Veen tells him that the project UO Accounting had been stopped in August.¹²⁶

Datawarehouse.

The beginning of this project was described at the end of Chapter 2, about the policy portal project (PPP). The most important goal of the PPP was to build a datawarehouse (DWH) that could be used by all kind of portals. The goal had not been realized. Even though the third audit had given a positive evaluation of the DWH.¹²⁷ The reality was that the portals were useless. But problems and/or errors had not been acknowledged, and there was no reason to assume that they had been corrected. It was therefore unclear why the next DWH project would be successful. And it wasn't.

For an informal plan of the new project the reader is referred to the document under 20090605 in the directory of this chapter. The document doesn't give a picture of the initial situation. It doesn't say what has to be done. It doesn't say how it can be determined whether the goal has been reached. But in some other respects it is quite clear. In the section "Results of the project" one reads for example:

«The datawarehouse is meant for once-only storage of all policy data of guaranteed quality. All policy information will be acquired from the datawarehouse.»

This is clear and seems ideal. But it is also déjà vu, and unbelievable. It is easy to use the word

¹²¹ This means: it is not sustainable. Probable developments will make it useless.

¹²² At a cost of about 100 € an hour.

¹²³ The report can be found in the directory Projects reports, under 20100830.

¹²⁴ ES acted as delegated commissioner.

¹²⁵ The minutes can be found in the directory of this chapter, under 20100830.

¹²⁶ The "nota" can be found in the directory of this chapter, under 20101018.

¹²⁷ See chapter 2.

“all”. But extremely difficult or impossible to realize.¹²⁸

A timetable isn’t given. Intermediate products aren’t mentioned. But the document concludes with a section:

«Planning of the results.

The project datawarehouse is planned in such a way as to produce a recognizable result every 3 months. IFC will submit a proposal for the planning of these results.»

This would mean that every quarterly report can report the passage of a milestone.

In the report about the risky projects for the 4th quarter of 2009 one can read:

«The planning is part of the PID. In the middle of November the PID has been approved by the Steering Committee DWH. The first part of the project concerns PAE (landing, enrichment, and making available). This part will take 3 months. Because of the time needed for organizing the project (including the users) and the Christmas holiday, completion of this part is expected in March 2010.»

In the report about the risky projects for the 1st quarter of 2010 one can read:

«The project DWH has produced a working prototype MVE.»¹²⁹, ¹³⁰

This remark is repeated in the report about the risky projects for the 2nd quarter of 2010.¹³¹ The new report also mentions a delay:

«The project will take longer than expected. NEA will make a new timetable. It will be discussed in the Steering Committee DWH. The delay has 2 causes:

1. An extra phase is necessary for flow data.¹³² Estimate: 3 months extra;
2. Necessary resources became available later than planned. This has resulted in a delay of 2 months;
3. More time is needed for coordination with NEA users. For PAE the available time was only just sufficient. For SE and HE the processes are more complex. NEA is trying to find out if 3 months is enough for each of these sectors.»

In addition, it is expected that the costs too will exceed the planning. No indication is given of the amount.

In the report about the risky projects for the 3rd quarter of 2010 one can read:

«The first milestone (delivery of MVE) was passed October 1, in agreement with the new planning».¹³³

At another point, this same report calls this milestone “prototype”. So it isn’t clear what has been realized. Furthermore, MVE is only a part of PAE. PAE should have taken 3 months. But as we see, already a part of PAE took 9 months.

The project may go slower than expected, but the speed of money spending exceeds the estimates:

«In the MVE phase the budget was exceeded by 200 k€. An audit has tried to find the causes. On this basis an action plan has been made for tighter project management. This resulted in stricter planning. Up to now progress is according to plan. The budget overrun is expected to remain restricted to MVE. [...] In the program Infrastructure this has been taken into account. For this program a budget of 4.5 M€ is requested for 2011. In the motivation it will be indicated what additional budget is necessary.»¹³⁴

The text doesn’t say what has been spent in 2009 and 2010. Is the originally requested budget of

¹²⁸ One might object that the text should be taken with a grain of salt. But if “all” doesn’t mean all, what does it mean?

¹²⁹ MVE= Mid-level vocational education, a part of PAE.

¹³⁰ The report about the risky projects for the 1st quarter of 2010 can be found under 20100414 in the directory Projects reports.

¹³¹ In the directory Projects reports, under 20100830.

¹³² Flow data describe the transition from the situation at one moment to the next. At any given moment, people are at certain places in the education system (in certain schools or type of education, and at certain levels). At different times they are at the same or different places. A collection of data describing the transitions is called flow data. For more on this subject see below, in the section about PIEN-flows.

¹³³ The report can be found in the directory Projects reports, under 20101006.

¹³⁴ We’re still quoting from the report under 20101006.

2.3 M€ already exhausted? Furthermore it remains unclear where the 4.5 M€ comes from. According to the MTM documents of 2/4/09¹³⁵ the budget for DWH in 2011 is 2.3 M€ minus what was spent in 2009 and 2010.

The report about the risky projects for the 3rd quarter of 2010 was discussed in the MTM of 25/10/10. The minutes of the meeting contain the following paragraph:

«DGHPS has questions about the DWH in the report about risky projects, where a budget overrun of 300 thousand euro's is reported. Marianne Bos explains the overrun, and the decision making about it in the Steering Committee. It is agreed to discuss this subject more fully next time, and also the question how to finance this type of budget overrun.»

The minutes of the three following meetings of the MTM make no mention of the DWH. Perhaps “next time” should be interpreted as the next MTM meeting with a NEA block. In other words: next month. Or the meeting with the next report on the risky projects. But in none of the minutes of these meetings could anything related be found. Neither is there any sign of results of a discussion as requested by DGHPS.

The report about the risky projects for the 4th quarter of 2010¹³⁶ continues:

«After a prototype the project DWH has produced a working production MVE. SE is ready to be taken into production».

Under “Implementation” the report notes:

«Employees of NEA/IP¹³⁷ are becoming more and more enthusiastic about the project, because the results become visible».

Even visible! Wow! But the remark is incomprehensible if the assertions of the top of IFC and the report of audit 3 would be correct. If they were, the datawarehouse was already fully operational two years ago, in 2008. So at least one of the remarks is untrue.

Under “I-principles”, “Risks”, the report notes:

«The architecture of DWH is not compatible with ROSA of the enterprise architecture of NEA».

In other words: the project was begun without proper thinking, and will have to be redone in a different way.

And under “Remarks”:

«The datawarehouse must be made accessible. This is arranged in the project Public Portal, which should be completed in 2011. Attention will have to be paid to the coupling of DWH and this portal».

In other words: whatever the DWH may be, it is useless without an additional project and additional money.

By way of intermezzo we give an example of the exertion of pressure by the management to bend the truth.

The chapter about the implementation of the renewal plan reports about a discussion about an inquiry by Ernst & Young into the causes of the failure of the implementation of this plan. In this discussion, one of the investigators notes that on their way to the top traffic lights have a tendency to become greener. The present chapter shows that this is no different in the ministry. In general the mechanisms responsible for the change in color are invisible. The following quote is an exception. It shows the SG as a source of pressure for greening. He even seems to order changing the color, by euphemistic (false) use of the word “propose”:

«6. Reports about risky projects (Appendices 11 and 12)

Summary of this item: every quarter MTM gets a report about projects marked as risky. The report pays special attention to risks. Renewal System Studyfinancing and Public Portal have been added to the report. Points requiring special attention are listed in the accompanying memorandum. The chairman proposes that in the next meeting all red lights have changed to green. IP has the lead in this. Risks outside the domain of the ministry should be escalated to find a solution. The report goes to the MTM».

¹³⁵ Which can be found under this date in the directory of this chapter, under 20110125.

¹³⁶ In the directory Projects reports under 20110125.

¹³⁷ IP= information products, the name of a department of NEA.

The quote is from the minutes of the strategic i+i council of 14/4/10.¹³⁸ It is the report of the discussion in this “council” of the report about the risky projects for the first quarter of 2010. The chairman was SG Koos van der Steenhoven. The quote is unabridged. It clearly says nothing about an interest in, or discussion about, the causes of the red lights. How can anybody in the council or MTM know that these problems can be solved within a month? It looks as if the SG is irritated by the red lights, and wants it to be understood that he doesn’t want to see them again.

About the other projects the present author has only little more information than the projects reports and a few haphazard other documents. The “little more information” was provided by people who were personally involved in the projects. The information gives additional support to, and shows nothing incompatible with, the conclusion that the misconduct shown above is widespread and structural. Even if it would show nothing new, it is important as a check.

PIEN-flows.

“PIEN” stands for: policy information education number. The education number is a personal number. By coupling educational data with the education number, information can be obtained about the education history of a person. This was not entirely new. Flow data can also be obtained without a personal number. The Dutch Statistics Office had done so for decades. However, putting the basic data in a computer system can greatly enhance their usability. They may for example be coupled with other digital personal data.¹³⁹ Due to the availability of computer systems and storage capacity, much more personal data are collected and stored than before. Since data are very portable and transferable, many new kinds of analysis can be made. In principle such analyses can be used to improve the education system.¹⁴⁰

People “move” through the education system. They go from one grade to the next, from one school(type) to another etcetera. At a given moment, someone is in a certain place (in a certain school or type of education, at a certain level). At different times one is at the same or another place. The series of data about a person at successive times defines his education history (in terms of these data). And the set of such data for a group of people defines education flows. An example of a specific kind of such data is the education matrix. The two axes of the matrix enumerate the different levels or types of education. Let A and B be items on the X and Y axis resp. Then the cell (A,B) of the education matrix contains the number, or percentage, of people who last year were in A, and are in B this year.

For several reasons it isn’t always possible to define education flows both unambiguously and measurably. For example because the “places” aren’t defined unambiguously, because the system is different in different parts of the country, or because it has changed frequently. At any one time, there may be more than one relevant system of places. For statistical (and policy) purposes this can be a real problem. A problem that often can only be “solved” at the cost of reliability.¹⁴¹

The purpose of the project PIEN-flows was to define a useful collection flow-variables, and make a basic flow dataset. The project was part of the portfolio of DGPS Kerstens. The principal contacts for the project were Erik Smits of IFC and Kasper Weekenborg of the ministry. The original budget was 360 k€.¹⁴² The project did not produce what was intended. In July 2008 a report with the “final results”

¹³⁸ In the directory of the present chapter, under 20100414.

¹³⁹ At least much more easily. Or so much more easy that what was practically impossible “by hand” can be done easily with computers. But don’t forget that what is possible in principle cannot always be done in practice. Not even with computers. One needs competent people, and these people need time and other facilities to do their work properly.

¹⁴⁰ The “can be” should be stressed. Improvement is not logical. On the contrary. Chapter 9 shows why governments and politicians have reasons to avoid the improvements which would most benefit other people.

¹⁴¹ That is: it cannot really be solved, and what is done to produce the published numbers increases the uncertainty, or error margin. Note that if the flow data are important, then stability of the education system is important too. Without stability there are no (detailed, reliable) flow data.

¹⁴² This is the IFC budget. Costs made by the ministry usually are substantial but ignored. If a project runs well and needs little attention, the costs of the ministry are small. But if not, (very) much attention and discussions may be necessary. This can easily cost several fte’s, at more than 50 k€ each.

was distributed all the same. It would be discussed in a meeting of 17/9/08. The representative of the department of HE for this project, Martine Warmerdam, was prevented from going, and asked Van Velsen to go in her stead. That's why the author has studied various documents of this project. He concluded that the "results" were defective, and that a lot of work remained to be done. The relation between the "results" and the original plan was very weak. The documents lacked logic and consistent terminology. Which are quite important for definitions which have to form the basis for data collection and analysis. The more so if they have to be reproducible by different people. The discussion of 17/9/08 confirmed these observations. All participants called the report unfinished, even though some said to find it a beautiful piece of work already. It was concluded that there should be a sequel.¹⁴³

The following nicely typifies the meeting. The representative of the department of SE, Jaap de Hoog, asked to use the same definitions in all working groups of the project. The IFC representatives,¹⁴⁴ Erik Fleur and Frans Verboon, didn't agree. Each of the working groups kept using its own definitions.

The micro report about this project in the projects report about the 4th quarter of 2008 says simply: «This project is completely finished». ¹⁴⁵ Nothing else. This was simply untrue. Which also can be concluded from the fact that p. 39 of the performance contract 2009 for IFC mentions a follow-up project. Requiring 1000 hours at 100 € an hour, in other words a budget of 100 k€. This continuation was not declared risky. Therefore it does not appear in the reports which remained after the merger/reorganization.

The meeting of the working group PIEN of 17/2/09 discussed the follow-up. The minutes of the meeting say: «The platform policy information is a continuation of the Steering committee PIEN, and will occupy itself with general flow information (cohorts)». ¹⁴⁶ "General flow information" was the subject of PIEN-flows. Somewhat further in the report, the text under the heading «Cohort: towards a new IFC project» clearly shows that PIEN-flows was unfinished. The items listed under this heading should already have been completed in the earlier project.

Information bank.

The purpose of this project is outlined in the projects report about November-December 2007:¹⁴⁷

«IFC realizes (a first phase of) an information bank with consistent answers to questions of ICE.¹⁴⁸ The information bank will be accessible, through the intranet of IFC, for all employees of IFC, the ministry and the Education Supervisor [ES]. The information bank contains information about pupil-dependent financing [of schools], examinations, and matters related to the cost of personnel».

The report continues with a summary of the actual state of the project:

«The technical part of the bank has been realized. A large part of the contents has been stored in the bank. Adaptation and supplementation are continuous processes. The ministry has been connected to the bank. With the ES there are still technical problems. It works temporarily with a CD ROM of the bank.»

The report concludes with a remark about an informal evaluation and its follow-up:

«Reactions on the information bank have been evaluated. In February 2008 the results and an advice about a possible continuation will be submitted to the Strategic i+i council.»

The information bank was a relatively simple and small project. In principle it was no more than making a (internal) website for the publication of a relatively small number of existing texts. It was part of the portfolio of uSG.

¹⁴³ Without giving a reason, Weekenborg was absent. According to Warmerdam this was rule rather than exception.

¹⁴⁴ That is, the representatives of the people actually doing the project.

¹⁴⁵ The report can be found in the directory Projects reports under 20090206.

¹⁴⁶ The minutes can be found in the directory of this chapter, under 20090217.

¹⁴⁷ The report can be found in the directory Projects reports under 20080207.

¹⁴⁸ ICE= Information center education, part of IFC/ NEA.

The report about the financial situation of the projects in January-February 2008¹⁴⁹ states:

- That the budget was 65 k€;
- That the budget had been spent.

A professional and reliable approach requires that a product is evaluated by people who are independent of its production. The project information bank however was evaluated by people who worked on the project. Their report was positive, and advocated continuation. (Even though it was not made clear why continuation was needed or useful). The report was obviously biased. Critical remarks were dismissed with false arguments.¹⁵⁰ The projects report May-July 2008 says the following about the evaluation:

«IFC has evaluated the pilot of the information bank. The Strategic i+i council has discussed the evaluation and the recommendation to continue. There have been talks about the size and publicity of the continuation. [...] it has been decided to continue with the technique of the pilot, except for some minor improvements, to expand the contents, and with stronger involvement of the people in the ministry and ES. In the beginning of September this proposal will be submitted to the Strategic i+i council for approval.»

Note that the bank is only called a pilot in the context of a request for continuation, and that the “pilot” has not been defined.

The last projects report, about October-December 2008, says the following about the project:

«In October IFC was requested to implement the project Continuation Information Bank, in agreement with the proposed PID. The project is the sequel of the pilot done in 2007-08. It will fill the bank, make it available to the ministry and ES, and adjust the texts in agreement with the policy departments and ES. For this purpose a process plan will be made, which will also be used for keeping the bank up to date. The involvement of the policy departments and ES will be strengthened by publications on intranet, presentations and meetings in different places about the contents».¹⁵¹

The budget for the sequel is 181 k€. This is rather amazing, for almost three times the cost of the first phase, which according to the projects reports of November-December 2007 had produced an almost finished information bank. The relatively high costs may be caused by the problems with ES. But if so, that should have been noted, if only because it remains a risk until solved.

From parent portals to connection points.

The author couldn't find a description of the original purpose of this project. It must have been something like the publication, through a public website, of information which is of interest to parents. For example when they have to choose a school for one of their children. Such as information about success rates, proportion of pupils going to different forms of higher education, the proportion of (un)qualified teachers and so on.

The project was part of the portfolio of DGPS Kerstens.

On 23/1/07 the decision to build a parent portal was communicated to, or taken by, the CCIPE.¹⁵² According to the minutes of the meeting:

«DGPS announces that a parent portal will be built, and that the backside (such as the findability by search engines) will be arranged properly. The CCIPE approves this proposal.»¹⁵³

The necessary data should be stored in, and retrieved from, the one and only DWH. Since the portal was to be public, there could be no doubt about the applicability of the web directives of the government.

¹⁴⁹ The report can be found in the directory Projects reports under 20080407.

¹⁵⁰ Source: statements of people personally involved.

¹⁵¹ The projects report October-December 2008 can be found under 20090206 in the directory Projects reports.

¹⁵² CCIPE= Central Committee Information Policy Education.

¹⁵³ The minutes of the meeting can be found in the directory of the present chapter, under 20070123.

In connection with the projects report about January-February 2007,¹⁵⁴ and the preparation of the periodic meeting of uSG with the top of IFC on 27/3/07, Edwin Streefkerk of the department of PE sent his DGPS a memorandum¹⁵⁵ with the following conclusion:

«Questions.

In the projects report IFC suggests that no clear choice has been made about the organization which will host this portal. As indicated above, the working group has reached agreement about this.

Questions you could ask are:

- Why has IFC not begun writing a PID?
- What ideas does IFC have about the integration in the PID of the decisions made by the working group about hosting by Infonet, and input from ES and IFC?
- Can IFC make an estimate of the additional costs due to participation of Infonet?»

In the minutes of the meeting of 27/3/07¹⁵⁶ one can read:

«Parent portal (4.1.1.): It is not clear how this project is to be continued. The department of PE chairs the working group. Conclusion: together with the department of PE DGPS organizes a meeting with the heads of IFC and ES to bring about progress in this project».

The projects report about May-July 2007¹⁵⁷ devotes two paragraphs to the parent portal:

«Parent portal: DGPS has stopped the project for the time being. DIP,¹⁵⁸ IFC and the departments of PE and SE will collaborate in writing a memorandum for DGPS and MTM. The memorandum will make proposals for choices related to the disclosure of public information and for choices about the infrastructure and instruments (the datawarehouse).

[...]

At the request of PE and as part of its public information policy IFC has made preparations for building a parent portal that should have been ready on 1/11/07. Together with PE talks have been held with organizations of parents. An inventory has been made of requirements and wishes for the portal. [...] However, the ministry was not yet sure about the desirability of a parent portal. After discussions with PE and DIP, DGPS has decided to stop the preparations as yet. DIP has been asked to prepare, in agreement with IFC, a memorandum for the MTM of 10/9/07 about the vision on the desired future datawarehouse of IFC.

It is expected that in autumn a decision about building a parent portal can be taken by the MTM. Of course, if this portal is to be built, realization can take place in spring 2008 at the earliest».

These paragraphs clearly show that the people in the CCIPE of January, first of all DGPS, didn't know what they were talking about. They show how the top management of the ministry works. Irresponsibly.

Note that the datawarehouse seems to play a central role in the problem. A vision on the DWH should be developed in the framework of the parent portal. At the same time it had been said for years that most of the money for the policy portals went to building the DWH, and that this DWH could then be used for other portals as well. The members of the CCIPE knew this.¹⁵⁹ Moreover, at this time the PPP was still running.

At the time of writing, nothing could be found any more of the meeting of the MTM of 10/9/07. The conclusions of the MTM of 8/10/07 specify some of the problems with the parent portal:

«Progress Information Policy Public (70796)

¹⁵⁴ The report can be found in the directory Projects reports under 20070323. The following concerns sec. 4.1.1 on p. 8.

¹⁵⁵ In the directory of this chapter, under 20070326.

¹⁵⁶ In the directory of this chapter, under 20070327.

¹⁵⁷ In the directory Projects reports, under 20070829.

¹⁵⁸ DIP= department of information policy.

¹⁵⁹ Could know and should know. They had been informed, and pretended to be competent to take decisions related to it.

The second phase of the program Information Policy Public is almost completed. The purpose was to make as much information public as possible. Apart from some minor problems progress is good. Because of problems of availability and performance the parent portal is delayed. An improved public database will be delivered at the end of October, two months later than planned. At the end of October MTM will receive a proposal for the third phase of the project.»¹⁶⁰

What the “availability problems” are is unclear. The “performance problems” remind one of the policy portals. Note that “performance problems” can mean that the portal simply doesn’t work, or too badly to be of use.

The last part of section 2.1.13 of the projects report about August-October 2007 reads as follows:

«On 25/7/07 DGPS, advised by DIP, decided not to request IFC to build a parent portal. Of the 240 k€ ES had made available for this project only 50 k€ were spent. The remaining 190 k€ is still in the IFC account. ES has great problems with the decision, because without the portal parents do not have an adequate source of information. ES feels forced to spend extra money for improvements of the ES website.»

The “problems of availability and performance” are not mentioned any more, but seem to be considered unsolvable. The text furthermore gives the idea that ES has been kept outside the decision making process. Which is rather strange, given its great interest in the project, and the (related) conclusion of the meeting of 27/3/07 with uSG quoted above.

The lesson isn’t learnt. The communication with ES remains insufficient. Witness the minutes of the meeting of 11/2/08 of uSG with the top of IFC:

«8. Final round of questions.

ES asks for the state of affairs in the parent portal project. The status of this project is “on hold”.

Via DIP an inquiry is made. The staff of uSG will ask DIP for the state of affairs, and report to ES».¹⁶¹

It took months before this was done. Van Velsen reminded Schouten of this promise in a mail of 13/6/08.¹⁶² After the above quote from the minutes of 11/2/08, he quotes from the minutes of a similar meeting on 14/4/08:

«Action 15: Find out state of affairs parent portal, and report to ES. The staff of uSG has not heard from DIP. It expects DIP information soon».¹⁶³

Van Velsen asks why this takes so long. Why could the information not be given immediately? Why couldn’t DGPS or DGNEA (or their representatives) give a decisive answer either 11/2 or 14/4? The project is on hold for more than 4 months, and nobody in this meeting knows why? What reasons have uSG and the management of IFC to believe that the obviously serious problems are dealt with adequately? Schouten did not reply.

Sometimes Schouten sent the minutes of a meeting of uSG with the top of IFC, but often she did not. When Van Velsen wrote his mail of 13/6/08 he didn’t know that in the meeting of 9/6/08 something had been said about the parent portal:

«Action 9: The Education Supervisor says that the scope of the project parent portal depends on the extent to which the ministry facilitates the sector. After this summer the scope will be determined on the basis of the information policy plan».¹⁶⁴

Things turned out differently. The minutes of the next meeting of uSG with the top of IFC, on 9/9/08, say the following:

«At the moment this [parent portal] project is inactive because continuation depends on decision

¹⁶⁰ The minutes of this meeting could not be found either. The quote is copied from a mail of 20080613 of Van Velsen to Schouten. Note that “as much information as possible” clearly cannot be taken literally. But at the same time it is completely unclear what information is meant. In the PPP similar promises had been made.

¹⁶¹ The minutes can be found in the directory of this chapter, under 20080211.

¹⁶² This was the mail that was written in reaction to Schouten’s assertion that she had not received any notice about problems with other projects than the PPP. It can be found in the directory of this chapter under 20080613.

¹⁶³ The minutes can be found in the directory of this chapter, under 20080414.

¹⁶⁴ The minutes can be found in the directory of this chapter, under 20080609.

making about the project Information Policy Public in the next CCIPE. For 2008 no new activities in the project parent portal are expected. If possible ES proposes to reprioritize the remaining budget for other ES projects.

Conclusion: Parent portal will be put on the agenda of the next CCIPE.»¹⁶⁵

On 20/10/08 the working group parent portal sent a draft memorandum to the working group i+i for forwarding to the strategic i+i council.¹⁶⁶ The memorandum proposed to offer a prize for suggestions for innovative use of education information. The reason given was the lack of ideas for spending the remainder of the budget ES had paid for the parent portal project. In preparation of the meeting of the strategic i+i council the draft was discussed in the working group i+i of 22/10/08. The working group rewrote the proposal as follows:

«Regarding the publication of education data of the ministry a policy of restraint has been agreed upon (see the criteria in the plan for the program i). Market and education institutions are much better than the government in reaching target groups. Still, the ministry will have to make its data available as complete, reliable and up to date as possible.»

The revised memorandum¹⁶⁷ concludes:

«Points for discussion

- What (dis)advantages does the strategic i+i council see in extra stimulation of the market for education data? Does the council share the line to organize a prize contest if necessary?
- Does the council approve of the use of the remainder of the ES budget for making the ES quality cards and reports better readable, understandable and findable (in a way which respects the architecture requirements)?»

The minutes of the council meeting could not be found, and the answers to these questions are unknown. They don't matter much, for texts such as those quoted clearly show wide support for the idea that the money which ES had made available for a specific purpose should be spent anyway, on a contest if necessary. It is clear that ES is not free to dispose of its money anymore.

In order to shed even more light on the way projects are born and die in this ministry, we go back in time a little. The following is a quote from chapter 3, Projects in the phase of proposal, of the projects report about January-February 2008:

«3.2.2. Windows for Accounting (was Horizontal accounting)

The project Windows for Accounting started in December 2007. It concerns a project for the SE council.¹⁶⁸ For IFC the development of central indicators, derived from data managed by IFC, is the most important part of the project. [...] In the beginning of March there was a first meeting of a working group with representatives of schools and managers. This group is supported by experts from IFC, ES and other organizations. Prof. Dr. R.J. Bosker of the Groningen Institute for Education Science gives scientific support. IFC was present at the first meeting of the working group. Further contributions of IFC still have to be decided upon. The purpose is to have the definitions of the central indicators ready and published on the website by the middle of 2008.

IFC has not yet been requested to make human resources available for this project».

Note that earlier reports and meetings about the parent portal do not mention Windows for Accounting (WfA).¹⁶⁹

In the following projects report WfA is still listed as a project in the phase of proposal. The text nevertheless implies that the project has started. About a formal request (order) or budget nothing is said.

In the first report about risky projects, the one about the 2nd quarter of 2009, one finds the following description of the goal of WfA:

¹⁶⁵ The minutes can be found in the directory of this chapter, under 20080909.

¹⁶⁶ In the directory of this chapter, under 20081020.

¹⁶⁷ The memorandum of the working group i+i to the strategic i+i council can be found in the directory of this chapter, under 20081023.

¹⁶⁸ The SE council consists of representatives of the schools providing secondary education.

¹⁶⁹ These "windows" have nothing to do with Microsoft.

«[The project intends to] Facilitate horizontal accounting by schools, by making available indicators about school performance and corresponding benchmarking. The indicators can also be used in the management of the school.»

Indicators about school performance and corresponding benchmarks are of prime interest for parents. So clearly the new project overlaps with the parent portal project. If that still exists. It probably doesn't. It isn't mentioned in the risky projects reports at any rate.

As regards financial aspects, the report says that the first phase has been completed within the budget, and that 4 M€ has been requested for the sequel. A (positive) decision (advice) is in the line.¹⁷⁰

The report about risky projects in the 2nd quarter of 2010, a year later, is more specific:

«1.2 M€ 1st phase (paid and spent)
4 M€ 2nd phase (approved for present phase)
3.7 M€ transition phase (budget requested for 2011).»¹⁷¹

The last mentioned amount may include 0.5 M€ of the parent portal project. This may be inferred from a remark of DIP at the end of the report about WfA in the risky projects report about the 1st quarter of 2010:

«A decision has still to be made about a parent portal requested by the SE council, and for which an additional subsidy of 0.5 M€ is requested. DIP has set conditions regarding portal policy and I-principles, so that the portal will be generic and reusable.¹⁷² A definitive proposal for the subsidy will follow, but the amount has already been included in the budget notification of SE to the SE council.»

The report about risky projects in the 3rd quarter of 2010 shows that the project WfA has run into difficulties with respect to both contents and management. The difficulties are due to interference with a new project “Connection point Sector” of DIP.¹⁷³ At the end of the report DIP explains its new (additional) conditions as follows:

«The purpose of the coupling of WfA and the connection point sector is to ensure that after completion of the project WfA the structural administration is facilitated by a connection point sector. The proposal of the SE council for an administrative organization for WfA is being adapted, whereby DIP advises about boundary conditions and subsequent steps. The adaptation is somewhat delayed, but for the time being this doesn't cause risks»^{174, 175}.

The connection point sector was an idea of DIP. DIP was unable to explain what it was and what it was good for. Outside DIP nobody saw the use. See for example the report about risky projects in the 3rd quarter of 2010.¹⁷⁶ For this reason coupling of WfA to the connection point causes serious risks for WfA.

3.6. Accounting for the maintenance costs of Studylink by IAG/NEA.

¹⁷⁰ Meaning that someone at the base of the hierarchical organization has written a draft decision (letter to IFC, to be signed by the SG), and that the draft is on its way through the hierarchy to the SG. Via the head of the employee, his head of department, the DG and possibly via others, such as the head of DIP. All these people have to initial the advice, to show they have seen it and agree with it. (I'm calling it a draft because it may be changed by anyone along the way).

¹⁷¹ This concerns WfA. The report can be found under 20100830 in the directory Project reports.

¹⁷² These conditions are part of the web directives of the Dutch government.

¹⁷³ According to the report about risky projects in the 4th quarter of 2009 the connection point sector has the following goal: «The connection point sector contributes to an effective and efficient exchange of information in the education chain by means of agreements about a shared infrastructure, concepts and standards. The connection point is the natural landing ground for ICT projects in the education sector». According to this report the budget is 5.5 M€. The lack of support for the proposal wasn't due to the purpose, but to the budget and the “landing ground”, which made everybody suspicious. Why couldn't the goal, a set of agreements, be realized without any additional money?

¹⁷⁴ Report risky projects 2010 Q3. In the directory Project reports under 20101006.

¹⁷⁵ I-principles are rules for ICT-systems or applications.

¹⁷⁶ In the directory Projects reports, under 20101006.

Summary and conclusions.

1. The management of IAG/NEA claimed money for the maintenance of a Studylink system without having the slightest idea of the character and amount of the required maintenance work. It had no plan for system development, and no plan for the transition period from old to new. There is nothing that proves that it had thought seriously about all this. The claims for compensation lacked even the least argumentation. In particular they are not founded on any calculation;
2. Some argumentation was obtained once and only once, for 2008: after more than a year and after credibly threatening with non payment in the beginning of 2009;
3. The information about the Studylink-related activities in 2008 showed that the management of IAG/NEA had no plan for what had to be done;
4. IAG/NEA had asserted that the claim was for structural (= permanent) work. The information showed that large part of the work was not structural but incidental (= temporary);
5. Until at least mid 2011 IAG/NEA refused to account for its claims and expenditure. It refused to give insight in the changes in its activities due to Studylink, and to justify its claims in an understandable manner;
6. The ministry nevertheless kept paying what IAG/NEA claimed;
7. Even though it is very well possible that the costs have not risen but fallen, or would have fallen if IAG/NEA had adapted its activities to Studylink competently;
8. IAG/NEA didn't stand by the relevant agreements in the performance contract,¹⁷⁷ and didn't keep promises made in meetings on the subject;¹⁷⁸
9. The deadlock in the talks ministry-IAG/NEA aren't solved because IAG/NEA sticks to its refusal to describe and explain the changes due to Studylink, and because IAG/NEA knows from experience that the top of the ministry will always pay;
10. The management of IAG/NEA lacks integrity. It submits unfounded financial claims, refuses to provide supporting argumentation, and gives incorrect essential information about the character of activities. It behaves as if it were accountable to no one;
11. The management of IAG/NEA is incompetent. It has insufficient knowledge of its own organization, and is, partly for that reason, unable to plan;
12. The management of the ministry knows that IAG/NEA doesn't comply with imperative and generally accepted professional and integrity norms. But the ministry doesn't do anything about it;
13. IAG/NEA has shown that one cannot cooperate with it on the basis of ("high") trust. Claims of IAG/NEA should not be believed at face value;
14. The ministry behaves as if money rains from the sky, and as if it is accountable to no one;
15. Benefits (services rendered by IAG/NEA) remained the same, costs have (substantially) increased;
16. The case therefore shows a mechanism for decreasing efficiency;
17. If it is true that reasonable people (can) solve problems by talking, then vital positions of ministry and IAG/NEA are occupied by unreasonable people.

Introduction.

The history of the justification of the claims of IAG for compensation of costs due to Studylink answers several important questions which are answered nowhere else in this study. There is no overlap with any of the other cases in the study. It is really supplementary. For these reasons it is described in some detail. Nevertheless, like most individual cases, this case is not necessary for drawing the conclusions of the study. So if that is the only or main thing you are interested in, you may skip this section without causing an essential gap in the argument.

Studylink is a system which connects student administrations of institutions for higher education with IAG. For communication it uses the internet. It supports information exchange between student and institution, between student and IAG, and between institutions as regards application and

¹⁷⁷ Another example: It didn't monitor the costs due to changes in activities due to Studylink, as it had promised.

¹⁷⁸ Sometimes it is hard or impossible in talks to deny a reasonable argumentation or say no to a reasonable proposal. The trick is to forget everything you don't like (for reasons you cannot make public, and account for).

registration of students. It is a system of the education institutions, and maintained by them. The system provides services formerly provided by the student administrations of the institutions.

Studylink is also the name of the organization which manages the system. This organization is independent of the ministry of education, IFC or IAG.

Before the introduction of Studylink, students sent their application to IAG, and registered at one or more institutions. IAG informed institutions of the applications, and the institutions sent information about the registered students to IAG. Now students communicate only with Studylink about their (application and) registration.¹⁷⁹ It is therefore clear that the corresponding processes of IAG have to change. Change costs money. The “incidental” costs of IAG were compensated by the ministry.¹⁸⁰ The department of HE thought that the structural costs of IAG after adaptation of the systems would be less than they were before Studylink. This was a reasonable assumption because Studylink took over work without causing new work. IAG nevertheless claimed that its costs increased.

At the end of 2007 Studylink had not yet been completed. Several new releases had been planned. The planning extended to beyond 2008.

December 2007.

On 12/12/07 representatives of the department of HE and IAG discussed the HE part of the (draft) performance contract for 2008. The representative of IAG, Jacob Smit, asked an increase of the yearly budget with 400 k€ for the maintenance of Studylink. This extra budget was to cover structural costs.¹⁸¹ The representative of HE, Van Velsen, replied that he could not believe without further arguments or proof that Studylink causes net additional costs. It was clear that the activities of IAG had to change because of Studylink. But as far as HE understood, Studylink should reduce the (net) workload of IAG. The costs should decrease instead of increase. In his opinion, IAG should try to describe the changes in an understandable manner, and make a plan for the changes needed in 2008. He said that he could not agree with the requested budget increase without insight in the changes in IAG activities due to Studylink. IAG should show that the changes add up to an increase in the workload equivalent to 400 k€. Smit accepted this request as being reasonable.

2008.

The discussion of 12/12/07 resulted in the following paragraph in the proposal of IAG for the PC 2008:

«3. Studylink

Since release 2.3 [of Studylink] IAG has maintenance costs for Studylink. At this moment 3.5 fte have been budgeted for process management. This is equivalent to 400 k€. The costs of the departments ES [Education service] and I&O [Infrastructure and operation] have not yet been clarified. Clarification is difficult due to obscurity about the procedure for drawing lots [for courses with a restricted number of students]. Release 2.4 will further increase management and I&O costs. IAG will monitor both savings and extra costs due to Studylink. IAG will give HE insight in the changes in the workprocesses due to transfer from the AS-application¹⁸² to Studylink».¹⁸³

This is how IAG told HE that the 400 k€ was not all. Supposedly the costs made or to be made by ES and I&O were not included in the 400 k€.

On 7/3/08 HE received a memorandum with a specification of activities of I&O.¹⁸⁴ The cost of

¹⁷⁹ It is possible that students still have to send their application to IAG. Maybe only in some cases. For example when the number of new students in a course in a given institution is restricted. The documents don't provide a decisive answer. The lack of clarity may be related to legal regulations, and to the fact that the change of address for application would mean loss of a job and loss of jobs for IAG.

¹⁸⁰ Out of the regular budget for system development. Amounts spent can be found in the progress reports, collected in the directory Progress reports IAG (Voortgangsrapportages IBG).

¹⁸¹ To be paid yearly, and to be distinguished from incidental costs, which have to be paid once only.

¹⁸² AS= Application and selection. This is a department of IAG.

¹⁸³ See the directory Maintenance Studylink, under 20080114.

¹⁸⁴ In the directory Maintenance Studylink, under 20080307.

these activities had been calculated with a model, as a percentage of the “basic” amount of 400 k€. In other words: they were not based on specified or described changes in activities. The calculated costs were 81 k€. Even if the model were correct, the basic amount of 400 k€ remained unfounded. IAG didn’t say what the 3,5 fte which were paid by these 400 k€ were doing or going to do. HE could only conclude that IAG tried to pull in as much money as it could.

Between 4 and 11/4/08 IAG announced that the costs of the line departments amounted to 95 k€. This brought the total amount to 576 k€.

Because time went by and because uSG wanted to finish the PC 2008, the ministry decided to agree conditionally. The following text of the PC was approved by both parties:

5. «The costs of the diplomabank, code of conduct and Studylink are covered by the means which have been explicitly marked as “item to be monitored”. The year after stabilization of the costs, the item will be transferred to the basic funding;
6. The amount listed for Studylink [576 k€] covers the maintenance costs up to release 2.3. Costs to be made due to later releases will be additional;
7. IAG monitors both savings and extra costs due to the introduction of Studylink;
8. IAG makes a plan that clarifies the changes in the activities of IAG as a consequence of the introduction of Studylink in 2008 and following years. The plan gives a well-substantiated estimate of the savings and extra costs. The plan will also describe the situation when Studylink operates as intended. This plan will be sent to HE in July 2008 at the latest. The plan will serve as basis for the discussion about the PC 2009».¹⁸⁵

There was voluntary agreement about this text. Nothing was dictated, and there was no trade-off. IAG nevertheless wasn’t able or willing to do what had it promised. In a mail dated 18/7/08 Smit gives a list of facts and remarks which according to him explain why the plan cannot be made. In a reaction of 25/7/08 Van Velsen shows that the conclusion doesn’t follow from the facts and remarks listed.¹⁸⁶ Moreover, Smit contradicts himself:

«When we try to map the costs for 2008 and later, we meet with the following difficulties:

[Follow five remarks which do not show that a plan as promised cannot be made].

In fact we don’t have a good picture of the effect of Studylink on the activities of IAG, certainly not for 2009 and later».

So after this mail of Smit it was more of a mystery than ever how IAG could have presented a precise amount in December 2007.¹⁸⁷ Van Velsen concluded that HE will probably not agree with the additional 576 k€ unless IAG gives the insight requested in the PC 2008. He didn’t understand how a meaningful discussion and advice about the PC 2009 would be possible without much more and better information. He furthermore noted that the cost monitoring in the 4-monthly progress reports had hitherto given very little useful information.

The most important characteristic of structural costs is that they come back every year. And that once approved, it is very hard to get rid of them. In other words: the costs claimed by IAG amounted to a lot of money. It was important not to acknowledge them until they had been properly described and accounted for. HE had no people who could check and evaluate the assertions of IAG about Studylink-related activities in past, present and future. For this type of work the ministry had an audit department (AD). However, AD claimed that it had no staff available. Priorities had been fixed by uSG, and only she could change them.¹⁸⁸ Therefore HE formally asked uSG to order AD to make the inquiry as indicated.¹⁸⁹ Such a request was a rather unconventional and surprising. It didn’t have the desired effect. AD simply didn’t want to cooperate. In a discussion with Van Velsen on 22/7/08, the head of the section Inquiries of AD, Femke Aarts MBA,¹⁹⁰ play-acted as if she didn’t understand what

¹⁸⁵ See the directory Maintenance Studylink, under 20080516, part 2.

¹⁸⁶ Both mails can be found in Corresp_PPC2008_IBG.

¹⁸⁷ It could have said that it was an estimate only, and could have offered to monitor activities and costs. Instead it didn’t show any doubt.

¹⁸⁸ In other words: AD didn’t want to cooperate. For what reason wasn’t clear.

¹⁸⁹ See the documents under 20080716 in the directory Maintenance Studylink.

¹⁹⁰ She always put “MBA” behind her name, even though the ministry (of education!...) didn’t use titles. Not on the nameplates of rooms, not in attendance lists or wherever.

HE wanted.¹⁹¹ She said that AD made three types of inquiry. What HE wanted didn't fit any. Aarts used all inventiveness she could muster to prove that HE should not ask AD but somebody else. With the help of examples and a lot of patience Van Velsen showed that AD had adequate expertise, and had done similar inquiries. It was only natural that HE would call on AD and that AD should help HE to take an accountable decision about acceptance of the claims of IAG. Given the knowledge of AD of the ministry and IAG, help of AD would be much more efficient than that of an outside consultancy firm.

After a very long talk HE promised to forward the plan of IAG to Aarts immediately upon receipt. After having studied the plan, HE and AD would discuss what to do.

The plan never came, and the contact with the AD got no follow up.

Time went on, and by the end of 2008 the PC for 2009 would have to be written and discussed. For this purpose IAG sent HE at the end of November a memorandum about "HE items to be monitored in 2009".¹⁹² The memorandum claimed that the maintenance costs for Studylink in 2009 would amount to 790 k€. While the mail of Smit discussed above, and the 4-monthly progress reports, clearly showed that IAG had only the vaguest possible idea of the changes in work due to Studylink.

The talks of the education departments of the ministry with IAG about the PC 2009 were coordinated by Alice van Gent, assistant of uSG for IAG. She asked the departmental contacts for their comments on the documents sent by IAG. Speaking for HE, Van Velsen replied that Studylink is the only difficult subject. And that it had already been extensively discussed. But that as regards the 579 k€ IAG had not submitted the argumentation which had been promised. Neither has adequate argumentation been provided for the 790 k€ of 2009. IAG asks HE for blind faith. HE is the wrong place to ask for that. Van Velsen said that for a year he had asked the questions every good civil servant should ask. He promised to ask his department what it wants, but that he would advise it to protest to uSG against the failure of IAG to send the promised plan, and against continuation of payment of the claims related to Studylink.¹⁹³

2009.

The ministry rejected the proposal of IAG. The PC 2009 mentioned no budget for Studylink. The text of the PC says the following:

«Before the 4-monthly meeting of April 1, 2009, IAG will provide insight in the savings and extra costs of the processes of central application, the drawing of lots, and selection, in the calendar year 2008 due to the introduction of Studylink. IAG will also explain the savings and extra costs in 2009. In the meeting of April, ministry and IAG will discuss the size of the budget which is to be made available for these processes in 2009».¹⁹⁴

This text was imposed by Van Gent and/or IAG without voluntary agreement of HE. HE disagreed because more processes could be affected than those mentioned, because it wanted to know what it could expect in the coming years, and because it wanted IAG to think seriously about the organization of its activities and about their planning. HE saw no convincing reason to deviate from the text in the PC 2008.

Nothing would be paid to IAG in relation with Studylink until it had explained how the money of 2008 had been spent, and how the requested budget would be spent in 2009. The threat was convincing. On 16/3/09 HE received a memorandum with a rather clear accounting for 2008 and a corresponding estimate for 2009.¹⁹⁵ It mentions total costs of 416 k€. Among other things, the memorandum shows that at the end of 2007 IAG had not seen some sizable cost sources, and, even more important, that many costs were incidental instead of structural. It was completely unclear what the structural costs would turn out to be in the end (if any). The memorandum gave rise to the suspicion that IAG tried to create a new source of money beside the fixed and booked up budget for

¹⁹¹ There is a short report of the discussion in Corresp_PC2008_IBG.

¹⁹² In the directory Maintenance Studylink, under 20081128.

¹⁹³ The mail is dated 3/12/08, and can be found in Corresp_PC2008_IBG.

¹⁹⁴ See the PC 2009 for IAG (= IBG), in the directory Maintenance Studylink under 20090218.

¹⁹⁵ In the directory Maintenance Studylink, under 20090316.

system development.

The next periodic meeting of HE with IAG was at 26/3/09. Two weeks after that meeting, Van Velsen wrote his counterpart Smit a mail thanking him for the memorandum with information about activities of IAG connected with Studylink. According to Van Velsen the memorandum was a useful basis for the discussion about the budget changes in the PC 2009. He noted that the meeting had shown that both IAG and HE believe that 2009 will be quite different from 2008. Problems solved in 2008 need not be solved again, but new problems may arise. The costs are hard to foresee. It is obvious that they have to be monitored. December 2009 or January 2010 a report should be made similar to that of 16/3/09. We agreed, the mail reminded Smit, that the realization 2008 is the best estimate for 2009.

As an appendix to the mail, Van Velsen sent a copy of the memorandum of 16/3/09 annotated with corrections, questions, suggestions and remarks. He asked for example for an additional section (roughly) describing the changes in IAG activities due to Studylink in 2008, and those expected in 2009. This may help relative outsiders understanding some of the information in the memorandum.¹⁹⁶

Smit promised to have the memorandum corrected and supplemented. But no more was heard of it.

14/12/09 IAG sent HE a memorandum about the costs for Studylink in 2009.¹⁹⁷ Its format was very different from that about the costs in 2008. It doesn't give insight in processes and changes, and it cannot be considered as an accounting for the costs. It doesn't show what is incidental and what is structural.

2010.

Beginning with 2010 the performance contracts with IAG and IFC were replaced by a single management agreement (MA) with the merged NEA. Van Velsen had been sidetracked, but was frequently asked for information and advice. The following shows how the ministry dealt with the NEA claims for Studylink under his successors.

In a mail of 14/12/09 Ron van der Meer, head of the section Finance of HE, asks Smit to account for 2009 and the estimates for 2010. He wants NEA to explain why Studylink causes cost increase instead of decrease.

Smit answers the same day. He gives no argumentation whatsoever. He says that NEA estimates that the costs in 2010 will be 800 k€. He wants this money to be marked as structural, and to make it part of the (structural) basic funding. He says there will be no savings, and that the 800 k€ is the sum of savings and extra costs.

On 19/1/10 Van der Meer replies that HE refuses to treat the costs for Studylink as structural. He wants to have the argumentation of NEA checked. Before long there will be a meeting of Van der Meer, Smit and the head of Studylink about costs and savings due to Studylink. After this meeting we may resume the discussion about structural costs.

In response to a request of Van der Meer, Van Velsen sent him a summary of the history of the IAG/NEA claims as given above. He advised:

- To ask NEA to remain monitoring and accounting for the costs until it has become clear that the work processes have stabilized;
- To remind NEA of the promise to account for the costs in 2009 in the same way as for the costs in 2008 (so that it provides some understanding).

The MA 2010 does not have appendices per policy department. The MA is sketchy, and rarely specifies. It mentions an item "Extra work Studylink", with the explanation: "Equal to forecast 2009".

¹⁹⁶ The mail ended with a paragraph about another financial claim of IAG. Namely a financial claim for the "helpdesk function". Van Velsen replied with a reference to a letter of IAG explicitly stating that there would not be costs for the taxpayer, and that there is no financial risk. The letter requested permission for the helpdesk function. Permission was granted under this condition. The claim will therefore not be honored. IAG did not refute Van Velsen's observation, but kept claiming nevertheless.

¹⁹⁷ It can be found in the directory Maintenance Studylink, under this date, 20091214.

Such a forecast was not known in HE, unless NEA meant the conclusion of the memorandum of 14/12/09. In March 2009 it had been agreed however that the realization 2008 would be used as forecast for 2009. Another forecast had never been discussed or accepted.

By the end of 2010 there still was no agreement between HE and NEA. Bhim Mahabier of the Finance department had begun with the preparations for the MA 2011, and needed clarity. On 20/10/10 he asked Smit and Van Velsen to provide it. Van Velsen forwarded the mail to his successor, Ber van Zanen.¹⁹⁸ Van Zanen reminded Smit on 2/11/10 of his (Smit's) promise to send a memorandum explaining matters. Van der Meer and Van Zanen had told Smit that they didn't understand what was happening at NEA. Referring to the request of Mahabier, Van Zanen asked Smit when he could expect the promised memorandum.

Smit replied the same day with a promise to discuss the question with financial people, and let Van Zanen subsequently know when to expect the answers. Having heard nothing for two weeks, Van Zanen sent Smit a reminder on 16/11/10. Smit replied by mail on 25/11/10.¹⁹⁹ Before Studylink, and towards the present author, Smit had always seemed to be polite, kind and forthcoming. This mail however was simply rude. It was hardly more than a string of assertions without explanation. Several of the assertions moreover were untrue. Costs had not been (acceptably) accounted for every year. Approval of an aggregated annual account does not imply approval of the separate accounts of all underlying activities. Even formally this isn't true, but practically it is complete nonsense.²⁰⁰ The mail made no effort to inform, explain or argue. HE simply had to believe that in 2010 the extra costs had grown to 1000 k€ (1 M€).²⁰¹ HE should stop arguing. The mail concluded that the decision making should be escalated to the DG's and SG as soon as possible.

On 30/11/10 Van Zanen replied by asking for the document with the formal agreement HE-IAG about the work of NEA for Studylink. Smit didn't send such a document, but sketched the history of Studylink as a project.²⁰² He said that the ministry had ordered IAG to cooperate. Costs for system development were to be paid from the regular budget for system development, and the costs for regular use of the new system (initially) via items to be monitored. In response to a question of Van Zanen Smit remarked that NEA would very much like to include the costs structurally in the basic funding, thereby ending the discussion.²⁰³

This didn't address the real problem, which was the explanation of a supposedly large net increase of the (structural) costs. In addition, it was clear that an unknown part of the present costs and those of recent years were incidental. Without substantially better information and explanation, present costs said nothing about future structural costs. It would be totally irresponsible for HE to transfer the present costs to the basic funding.

In the evaluation of discussions like this, one should keep in mind that they are part of the yearly cycle of the performance contract or management agreement. In other words, that there is the pressure of time, and that there may be a shortage of time and practical possibilities.

HE didn't know what to do. A month had gone by, quite a few mails had been exchanged, but Mahabier was none the wiser. Van Zanen told Mahabier that the costs of Studylink should be paid from the basic budget. Mahabier didn't agree, because there was no reliable forecast of the costs in the coming years. He wanted to include Studylink in a table under the heading: "Other work". Paul van

¹⁹⁸ Successor of Van Velsen as representative of HE for NEA. This job was possibly transferred for more than one reason, but an important one was ensuring a smooth transition. Van Velsen would leave the ministry 31/7/11. Van Velsen himself had taken the initiative for the timely transfer of his duties.

¹⁹⁹ The mail was addressed to Van Zanen and Mahabier.

²⁰⁰ Formally, acceptance of an annual account only means that the accounting is numerically correct, that no money has vanished. It doesn't mean that the money was spent well, effectively or efficiently.

²⁰¹ The mail implied that there were still incidental costs, and that a stationary state had not been reached.

²⁰² In a mail of 30/11/10.

²⁰³ From 2008 to 2010 the claims increased steadily. There is no end in sight, so it is highly improbable that agreement now will end the discussion. The more so since HE has shown to accept everything, if only after a lot of protesting.

Capelleveen, the acting head of Van Zanen's section, protested.²⁰⁴ Studylink does not introduce a new task, but another way of doing the same task. A task prescribed by law. Due to lack of information and explanation HE cannot judge whether the new way costs more or less. HE therefore sees Studylink as part of the activities which have to be paid out of the (unchanged) basic budget. If Mahabier saw things differently, DGNEA should be asked to send a mail to the ministry²⁰⁵ with the NEA point of view.

A few days later, 7/12/10, Van Capelleveen sent Smit a mail with the views discussed with Van Zanen. Including the suggestion to ask DGNEA to put the NEA viewpoint in writing. Smit answered the same day. Apart from a repetition of remarks from earlier mails, he showed by "logical reasoning" that Van Capelleveen's ideas lead to ridiculous conclusions:

«At the time the ministry ordered IAG to use Studylink in the application process. If we had been allowed to set priorities by ourselves, I don't know whether we would have chosen to get our data from Studylink.

In several reports we have explained that there are extra costs for NEA. In your opinion this seems to be insufficient, and that's why you conclude that you cannot determine whether there is more or less work. In 2008 the explanation has resulted in payment of the costs, and in 2009 in a claim which was approved by a chartered accountant.

From your reaction I infer:

- The claim for 2009 will not be paid;
- The costs in 2010 and following years will not be paid.

If this is the conclusion, not much can be done except asking DGNEA to send a letter to the SG explaining the problem. And are you saying that NEA is completely free to set its own priorities, and to determine its relation with Studylink?

Did I understand you correctly?»

Of course not. In a mail of less than an hour later, Van Capelleveen and Van Zanen gave further explanation:

«Independent of the choice for Studylink in 2008 and the corresponding incidental costs paid in 2008, it remains important for the MA 2011 to know how the savings and extra costs in the going concern [= basic budget] add up.

Maybe Studylink causes extra costs- although we find the amount mentioned by NEA quite implausible- but on the other hand there are cost developments in other areas around application and selection: savings and extra costs. The integral cost development and its causes have not been explained satisfactorily.

The request to increase the basic budget because of Studylink can only be answered after clarification of the integral picture. If this is done for 2011, it should by inference be possible to find out whether the costs for 2009 and 2010 are structural or incidental, and do or do not pay themselves back in other areas [...].

We would be grateful if we could comment on the draft letter of DGNEA about the entirety of savings and extra costs. After all, the requested clarity benefits everyone ministry-wide».

Smit mailed a thank you for this reaction.

The author has no information about the continuation of the discussion, only about its results as witnessed by MA 2011, dated 5/1/11.²⁰⁶ In a table on p. 57 one reads:

«To be covered: 800 k€.

Explanation: Other work ministry 2010 added to Basic Contract (not covered in budget estimates)».

This is explained (to some extent) on p. 58:

«3.4 Other work ministry

²⁰⁴ By a mail to Mahabier of 7/12/10.

²⁰⁵ This is formally incorrect, since NEA is part of the ministry. The mail could be addressed to the SG, or to HE's DGHPE.

²⁰⁶ The text of the Dutch original contains a lot of strange word sequences. An effort has been made to make the text a bit more understandable while keeping the style intact. Assuming of course that the present author understood the text sufficiently to be able to do this.

As from this management agreement the following Other work Ministry from 2010 is structurally added to the Basic contract. In 2010 they were still monitored, per 2011 NEA considers them sufficiently stable to be included in the Basic contract. [...] It concerns [list of items]. Per 2011 Studylink too is a structural part of scope Basic contract. Where it is understood that the costs for Studylink (800 k€) have to be paid additionally».

And confirmed on p. 64:

«The basic budget ministry is 170.4 M€. Of this budget, 162.6 M€ is covered by the budget estimates 2011²⁰⁷ [...] plus 7.8 M€ still to be covered [“found”]. The 7.8 M€ consists of several items which have to be covered incidentally or are not yet included in the long term budget estimates for NEA. This concerns:

[...]

0.8 M€ Studylink (HE) NEA wants structurally in Basic contract 2011, covered incidentally for 2011 and following. Studylink has been an item to be monitored. NEA refers to the PC’s of 2008 and 2009.

Because of their nature, these 7.8 M€ still to be covered Basic contract 2011 belong to the structural covering Basic contract».

It follows that NEA has succeeded in getting a structural budget increase of 0.8 M€ because of Studylink. For work which at least in part is temporary. And without providing an understandable account of what is done for this money.²⁰⁸

3.8. To conclude. The General Accounting Office evaluates the consequences of its ICT-reports.

This section consists of quotes from a report of the Dutch General Accounting Office and remarks about them.²⁰⁹ The report is entitled *How the government deals with ICT 2012- Lessons learned*. The report evaluates the effects of recommendations in earlier reports. The report was submitted to the chairman of the Tweede Kamer of Dutch Parliament by letter of 28/3/13.²¹⁰

«1. ABOUT THIS INQUIRY.

[...]

Partly in response to our inquiries of 2007 and 2008 the minister of Internal Affairs has announced measures for the development and execution of ICT projects. Such as the employment of various instruments for managing and accounting: the introduction of chief information officers (CIO’s), project portfolio management, ICT feasibility tests, a framework for weighing sourcing, business cases, the ICT dashboard, and Gateway Reviews. The present inquiry intends to give an overview of the way government organizations dealt with ICT in 2012. In particular we want to find out whether the lessons of our earlier inquiries have been used in the management of ICT projects

[...]

Framework of the inquiry.

The purpose of this inquiry is to contribute to an efficient approach to ICT by the government. The central question we want to answer is: “To what extent does the present approach of ICT by government organizations guarantee efficient ICT management in the government?”. In our effort to

²⁰⁷ Probably the budget estimates of the Dutch central government, the Rijksbegroting 2011. See p. 177 and following of the Begroting OCW 2011, Memorie van Toelichting, Kamerstuk 148632. The “162.6” (162,6 in Dutch notation) could not be found. It probably has another source, because this publication only uses rounded numbers. But 161 could not be found either. It didn’t seem worth while to investigate.

²⁰⁸ And the “chartered accountants” did indeed approve. This is relevant in connection with chapters 7 and 8, and should therefore be kept in mind.

²⁰⁹ The quotes are slightly abbreviated by dropping irrelevant words which hinder readability. The full original text is in the dossier. As always, omitted clauses and sentences are indicated by [...].

²¹⁰ The title of the report is “Aanpak van ICT door het Rijk 2012- Lessons learned”. It can be found in the directory of this chapter, under 20130328. The letter is printed on the first page of the report. The reports of the inquiries of 2007 and 2008 are included in the PPP directory, under 20071129 and 20080701.

find an answer to this question we will focus on the management of ICT projects».²¹¹

«2. CONCLUSIONS AND RECOMMENDATIONS

[...] For the management of these [ICT] projects several instruments are available. Although these instruments don't guarantee flawless progress of ICT projects, they can reduce the risk of failure, and help timely adjustments. We therefore evaluated how government organizations adapted and implemented some important management tools. This resulted in the following picture.

If we compare the present approach to ICT projects with the situation at the time of our inquiries of 2007 and 2008 we conclude that the government organizations have given an important impulse to efficient management of ICT projects. However, we conclude also that optimal management has not been realized by far».²¹²

«APPENDIX 2. METHODOLOGICAL JUSTIFICATION

[...] This appendix describes the method of inquiry.

[...]

Norms

Because of the “lessons learned” character of the inquiry, we apply the norm that organizations have learned from the lessons of earlier inquiries».²¹³

«Method of inquiry

To answer the questions of this inquiry, we began by studying the application of instruments for managing and accounting with the help of available documentation. For this purpose we also used reports of other inquiries, including reports from foreign sister organizations.

In addition to the study of the documentation, we held interviews with:

- the department of information policy government- chief information officer government;
- 11 ministerial CIO's/ CIO offices;
- 16 project managers of large or high risk projects;
- the head of the Gateway Office;
- IT auditors Audit Service Government.

For the interviews of project managers we focused on managers of large or risky projects which started after 1/1/09, because the instruments following from our inquiries of 2007 and 2008 may be applicable to these projects. We investigated which instruments were applied and how. Where possible we have performed this analysis for all the large and risky projects of the *Annual report management government 2011*.²¹⁴ Where this wasn't possible, the questions about the application of instruments were asked in the interviews. In this way an overview was obtained of the application of the instruments. Next the added value of the application of the instruments was evaluated, against the background of the lessons from ICT projects which we formulated in the past.

After verification of the findings we submitted the draft report of the inquiry to the minister for Housing and Government Organisation, for his administrative comment.²¹⁵ His comment and our reaction on it were assimilated in the report».²¹⁶

P. 62 of the report gives an idea of the kind of results obtained from the interviews:

«Our interviews with both the CIO's and the leaders of the large and risky projects show a preponderantly positive picture of the Gateway Reviews. [...] The CIO's mention some specific attributes of the instruments as most important explanation of their positive experiences:

- the employment of outsiders gives fresh insights, and their scrutiny has a relatively large

²¹¹ Aanpak van ICT door het Rijk 2012, p. 7.

²¹² Aanpak van ICT door het Rijk 2012, p. 10.

²¹³ Aanpak van ICT door het Rijk 2012, p. 67.

²¹⁴ Jaarrapportage Bedrijfsvoering Rijk 2011. (Not in the dossier).

²¹⁵ The formulation in the report, “bestuurlijk wederhoor”, is very vague, or even undefined.

²¹⁶ Aanpak van ICT door het Rijk 2012, p. 68.

- influence;
- the confidentiality of an instrument stimulates open and safe exchange of information and insights;
- a short application time yields quick results;
- a review team consisting of peers [...] means that situations are recognized, that much knowledge and expertise is available, and that the probability of acceptance is high;
- the fact that the Gateway reviews do not threaten personal interests contributes to a constructive and helpful atmosphere, in which people can learn from one another».

Remarks.

1. The inquiry was held in 2012. It investigates only larger and risky projects which started after 1/1/09.²¹⁷ Theoretically it might cover some of the projects described in this study. But it certainly doesn't cover all of them. However that may be, the question whether some of the projects studied above satisfied the selection criteria of the DGAO is practically meaningless. For it is obvious from the project descriptions in this and the previous chapter that the DGAO report doesn't give a reliable picture of the project management in government organizations. Even if the (comparative) conclusions would be formally correct, they mislead by hiding a much more relevant truth.^{218, 219}
2. Here as well as in the inquiry of integrity to be described in the following chapter, DGAO only looks at the application of instruments. DGAO asks whether an instrument has been applied, not whether there is a noticeable or measurable (positive) effect on the project results. The results of the application on projects are not studied.²²⁰
3. It is evident that the DGAO reports of 2007 and 2008 gave no positive "impulse" to the management of the projects of the ministry of education and its agencies. The reason is simple: the reports were completely or almost completely ignored.²²¹ Where the "almost" refers to the fact that as from a given date uSG got the additional title of CIO. It didn't change her ways in the least.²²²
4. Why didn't DGAO look for improvements in projects which started before 1/1/09? Since DGAO had studied them before it would have been relatively easy. Are these projects running better due to application of new instruments? Much money is spent on them, and they should perform important functions. So why ignore them?²²³
5. Was there anything new in what the CIO's told the Accounting Office about positive characteristics of Gateway reviews? Isn't what the CIO's do much more important than what they say? P. 63 of the report says that the project leaders assert that «[the recommendations of the Gateway](#)

²¹⁷ The definitions of "large" and "risky" should be checked, as well as the way projects were identified and selected. Did the DGAO select, or the government organization?

²¹⁸ In making this remark a generalization is made from the ministry of education and its agencies to government organizations in general. This is justified by the analyses in a later chapter. Put simply: the same (fundamental) mechanisms cannot but have the same (or very similar) effects in different places. The analyses uncover the mechanisms.

²¹⁹ Improvement need not result in something that is good or adequate. Something can still be insufficient after improvement. Lesson: especially when a politician or manager says that things have improved, ask whether they have sufficiently improved. And what reasons (s)he has for this opinion.

²²⁰ Note that both the "instruments" and their "application" are vague and elastic. "Elastic" meaning that application of an instrument may be effective, have no positive effect(s), have negative effect(s), or everything in between.

²²¹ Why should it be otherwise?

²²² In Dutch the saying is: A monkey may don a golden ring, it still remains an ugly thing.

²²³ DGAO seems to assume implicitly that for project managers to act professionally, it is sufficient for DGAO to tell them how that is to be done. DGAO seems to assume implicitly that its advice is followed up. Isn't this irresponsible nonsense?

[reviews are acted upon»](#). Shouldn't this be checked?²²⁴

6. The report says nothing about checks of what people told in the interviews. It doesn't discuss the interview as a method of acquiring information. It seems to assume that the people they interview speak the (complete relevant) truth. Even when it should know that they have an interest in giving a rosy picture. Moreover, people may not only lie and tell half truths, but make mistakes as well.
7. What is meant by "verification of the findings"?
8. In connection with other "inquiries", it is noted²²⁵ that only people high in the hierarchy were interviewed.
9. The DGAO does not explain how the central question of the inquiry can be answered by the method used. Furthermore, the conclusion of the DGAO gives no estimate of the extent to which the present approach guarantees efficient ICT management. It only says that the situation is better than it was, and that it is far from optimal. It doesn't say for example that the project management has improved sufficiently, or that it is still insufficient.²²⁶ Does it know or doesn't it? Wouldn't that be the most relevant thing to tell?
10. The report shows that the General Accounting Office is part of the problem.

²²⁴ And even if it were true, what does it mean?

²²⁵ By the present author.

²²⁶ Even though both assertions are (logically) compatible with what DGAO does say. Of course, the political formulations suggest that the project management is still very inadequate.

Chapter 4.

Integrity in the Dutch ministry of education, and government.

Table of contents of this chapter.

1. Summary and conclusions.
2. Introduction.
3. Definition of “integrity”.
4. Codes and integrity management put to the test: the three audits of the policy portal project.
 - a. 2007, autumn. An appeal to the SG. The first audit.
 - b. 2008, spring. The second audit.
 - c. 2008, autumn. The third audit and its consequences.
 - d. 2009. Round up.
5. Words of SG and uSG.
6. Quotes from the Code of conduct of the ministry of education.
7. Reality check: some facts of the case Spijkers.
8. Improving integrity in public administration: OPIPA and DGAO.

4.1. Summary and conclusions.

1. In the policy portal project, the SG was asked personally and explicitly to enforce the Code of conduct of the ministry. According to the Code «[Our conduct with respect to each other and the outside world should be open, service-oriented, respectful, impartial, and reliable. In a single word, honorable](#)». Initially the SG procrastinated by claiming a need for inquiries; later on by a combination of denial, pretexts, and a trumped up inquiry.¹
2. There were three formal inquiries of the PPP. The first was a defective quick scan. The second may have been better, but its report was kept secret. The third was an exercise in cunning and deceit.
3. Cunning and deceit by auditors supposed to respect not only the code of conduct of the ministry, but also their professional code. This was pointed out to the SG. He did nothing.
4. SG and uSG lie systematically.
5. The SG preaches integrity. He personally signed the Code of conduct. But he doesn't live up to it, and doesn't combat violations.
6. IFC, DGPS, DGHPE, SG and uSG are the opposite of “open, service-oriented, respectful, impartial, and reliable.”²
7. In combination with shows of indignation given by politicians when someone dares to cast doubt on their integrity, the code of conduct of the Dutch ministry of education can only be meant to give outsiders the idea that the integrity of the ministry is beyond doubt. In other words: it is intended to mislead.

¹ In this chapter, “Code” with a capital refers to the code of conduct of the ministry of education. SG means secretary-general, the highest officer in a ministry. He is only responsible to the minister, the political head(s) of the ministry. “uSG” stands for under secretary-general. In the ministry of education there was only one uSG.

² DG= director general. A director-general is responsible to the SG and/or uSG, and is head of a number of departments. For the other abbreviations see chapter 2. (The precise meaning does not really matter in the present chapter).

8. In the case Spijkers:
 - a. For over 20 (twenty) years Fred Spijkers was terrorized by government officials and accomplices for refusing to collaborate with structural deceit by the Dutch ministry of defense;
 - b. For most people in and around the Dutch government “Befehl ist Befehl” is decisively more important than integrity;³
 - c. Nobody has been punished for misconduct or crimes;
 - d. In spite of codes of conduct and the fact that many people who must have known of serious violations of codes and laws, nobody but Spijkers blew a whistle;
 - e. No member of the government or parliament judged the events sufficiently unacceptable to stubbornly request correction, or to refuse to cooperate any longer with colleague(s) who contributed to the violations, or condoned them;
 - f. Government and parliament have made documentary evidence inaccessible. So that none of their members and their accomplices can be prosecuted, and justice cannot be done.
9. The publications of the Office for the promotion of integrity in public administration (OPIPA)⁴ and of the General accounting Office (GAO) suggest that in the Dutch government integrity violations are marginal and unimportant, and that everything possible is being done to ensure integrity. They do not warn of a serious integrity problem.
10. Nothing in the publications of OPIPA and DGAO shows understanding (if knowledge) of the reality shown in the case reports of this study. There is no trace of an analysis of the case Spijkers. They ignore the alarming paper of Van der Vliet in the magazine Public Management about this case.
11. Neither OPIPA nor DGAO informs readers about the limitations of their publications and inquiries.
12. OPIPA and DGAO are part of the problem.

4.2. Introduction.

“Integrity” is one of the most important concepts in this report. The dictionary definitions are too vague for unambiguous and meaningful discussion of some of the main topics of this report. Therefore the chapter begins with a section about the definition of concepts related to integrity.

The following section describes efforts to get the SG to actively enforce observance of the code of conduct in the PPP. Next it is shown that in interviews SG and uSG try to paint a picture of themselves that is incompatible with their actual conduct.

In the preceding chapters, the sequence of examples of misconduct is never broken by effective proper conduct. The facts presented seem to be incompatible with a large majority of other information. It is quite understandable that this filled the reader with doubt or disbelief. Let the reader therefore keep in mind that facts remain facts. And that words can be chosen and spoken arbitrarily. The air is patient. Furthermore, the last chapter of this report will show that there are good explanations for the scarcity of reliable information and the erroneous rosy picture of the management of public administration. But for the moment it should suffice to give an example of a case which, possibly even more than the cases of the chapters 2 and 3, shows that very many people actively and passively contributed to extremely gross misconduct, and that in over twenty years there were no effective exceptions. (And that there is no happy ending). Even on its own, this single case, named after its unheroic hero, Fred Spijkers, is logically speaking sufficient to disprove all theories about the adequacy of our present government and law systems. It is a case moreover which is not explained by

³ “Befehl ist Befehl” is German for: “an order is an order [and has to be obeyed irrespective of your personal opinion or conscience]”. It was the answer many nazi’s gave when asked why they committed war crimes.

⁴ In Dutch: Bureau Integriteitsbevordering Openbare Sector (BIOS).

any of the theories taught at present day universities.

The final section of this chapter describes pretended efforts by Dutch government agencies to improve the integrity of public administration. None of them takes account of the reality of the well-known whistleblower cases and the financial crises, let alone the internal functioning of organizations. They talk about a purely imaginary world.

This chapter was mostly written directly after the chapter on the PPP, or shortly before that chapter was completed. After rereading it after completion, there seemed to be no good reason for substantial change.⁵

4.3. Defining "integrity".

Before giving a less ambiguous definition, which is furthermore adapted to the context of this book, we quote some definitions from the literature.

The Merriam-Webster dictionary gives the following definition:⁶

«**Integrity** [...] Firm adherence to a code of esp. moral or artistic values: incorruptibility».

This only means something if you know the code, and/or meaning of “incorruptibility”. Merriam-Webster gives a very broad definition of “corrupt”, including “characterized by improper conduct”, making integrity a rather stringent norm.

Similar definitions can be found in almost all dictionaries.

ISSAI 30, chapter 2, of the International Standards of Supreme Audit Institutions (ISSAI) of the International Organization of Supreme Audit Institutions (INTOSAI) gives the following description:

«Chapter 2. Integrity.

12. Integrity is the core value of a Code of Ethics. Auditors have a duty to adhere to high standards of behavior (e.g. honesty and candidness) in the course of their work and in their relationships with the staff of audited entities. In order to sustain public confidence, the conduct of auditors should be above suspicion and reproach.
13. Integrity can be measured in terms of what is right and just. Integrity requires auditors to observe both the form and the spirit of auditing and ethical standards. Integrity also requires auditors to observe the principles of independence and objectivity, maintain irreproachable standards of professional conduct, make decisions with the public interest in mind, and apply absolute honesty in carrying out their work and in handling the resources of the SAI.»

The English language Wikipedia page “Integrity” begins as follows:

«Integrity is a concept of consistency of actions, values, methods, measures, principles, expectations, and outcomes.

Barbara Killinger offers a traditional definition:

Integrity is a personal choice, an uncompromising and predictably consistent commitment to honor moral, ethical, spiritual and artistic values and principles.

In ethics, integrity is regarded [by whom?] as the honesty and truthfulness or accuracy of one's actions. Integrity can stand in opposition to hypocrisy, in that judging with the standards of integrity involves regarding internal consistency as a virtue, and suggests that parties holding within themselves apparently conflicting values should account for the discrepancy or alter their beliefs.

The word "integrity" stems from the Latin adjective *integer* (whole, complete). In this context, integrity is the inner sense of "wholeness" deriving from qualities such as honesty and consistency of character. As such, one may judge that others "have integrity" to the extent that they act according to the values, beliefs and principles they claim to hold.

⁵ Many important conclusions can be drawn without knowing everything.

⁶ For this study use is made of the edition which is part of the Encyclopaedia Britannica 2002 for computers.

A value system's abstraction depth and range of applicable interaction may also function as significant factors in identifying integrity due to their congruence or lack of congruence with observation. A value system may evolve over time while retaining integrity if those who espouse the values account for and resolve inconsistencies.»⁷

This is followed by ill defined text, which is hardly or not substantiated. It seems to suggest that integrity is no more than consistency. Nothing is said about the relation between this definition and the dictionary and/or INTOSAI definition. Obviously, the last group agrees with common parlance, while the consistency definition misses essential characteristics.⁸

The definition which is used in the present report agrees with the dictionary and INTOSAI definitions, but is more explicit. It is furthermore adapted for use in the context of this book. It leaves less room for ambiguity and cheating. The concept is defined by its constituents. Some of them are not independent but related and overlapping. For clarity this redundancy has not been eliminated.

Definition. Integrity is a characteristic of behavior which is relevant to others; relevant in their opinion. The others may be addressees, people whom one is supposed to represent, the public, taxpayers, and so on. By definition, integrity requires that one:

- Is truthful;
- Is open: informs timely, fully and correctly about everything that may be relevant to others, in their opinion. The “others” include the people to whom one is accountable;
- Is aware of one’s knowledge and abilities (has sufficient self-knowledge);
- Is consistent;
- Has no false pretensions;
- Acts in accordance with applicable knowledge, know-how, norms and values;
- Acts in accordance with applicable codes (in so far as compatible with those listed here);
- Does not accept a job which requires false pretensions. That is: which requires more knowledge or abilities than one actually has. And about the execution of which one will not be able to account in an acceptable way;
- Executes a job properly. In accordance with the job description and purpose, and appropriate norms (and which are accountable)⁹. So “properly” does not mean: “as usual”, or “as good as possible”;
- Keeps promises, agreements and so on. Makes only promises one has reason to believe one can fulfill. Where applicable draws attention to risks;
- Doesn’t pretend that a job is executed properly if it isn’t;
- Isn’t bribable;
- Acknowledges errors and mistakes;
- Only deviates from any of these norms after permission has been granted beforehand in accordance with these norms by all people concerned.¹⁰

The underlying Dutch study uses the (Dutch) adjective “integer” for behavior and persons: an “integer persoon”. There seems to be no perfect (“1-1”) translation for this adjective. Because of the following descriptions of related terms in the Merriam-Webster the next best translation seems to be “honorable”.

«upright
[...]

⁷ Wikipedia 29/11/13.

⁸ At least seems to, or explicitly. For on the basis of the paper *Communication and norms* (to be found as pdf-file on the internet), it can be shown that the definitions are identical if the language agreement is assumed. But this is probably not what the author(s) of the wiki page mean or understand.

⁹ Or in agreement with the dictionary definition of integrity. Covering up may be a norm, but isn’t accountable towards those who pay, and not in agreement with the dictionary definition of integrity.

¹⁰ All: not only a majority.

syn upright, honest, just, conscientious, scrupulous, honorable mean having or showing a strict regard for what is morally right. upright implies a strict adherence to moral principles <a stern and *upright* minister>. honest stresses adherence to such virtues as truthfulness, candor, fairness <known for being *honest* in business dealings>. just stresses conscious choice and regular practice of what is right or equitable <workers given *just* compensation>. conscientious and scrupulous imply an active moral sense governing all one's actions and painstaking efforts to follow one's conscience <*conscientious* in the completion of her assignments> <*scrupulous* in carrying out the terms of the will>. Honorable suggests a firm holding to codes of right behavior and the guidance of a high sense of honor and duty <a difficult but *honorable* decision>.

In this report, an honorable decision is defined as a decision in accordance with the requirements of integrity enumerated above.

4.4. Codes and integrity management put to the test: the three audits of the policy portal project.

Most of this section has already been told in the chapter on the policy portal project. It is included in this chapter for clarity and convenience, and to make the present chapter more self-contained. But if you have read the chapter on the policy portal project and still have it in mind, you can skip the present section without missing much.

2007, autumn. An appeal to the SG. The first audit.

In the autumn of 2007¹¹ Van Velsen called on the SG, and informed him about the course of the PPP. In particular about the way IFC reported about the project. Van Velsen pointed out that the behavior of IFC in this project was incompatible with the Code of conduct of the ministry. He said that his colleagues and he himself wanted to be treated decently. As required by the Code. He explicitly requested the SG to enforce the Code.

He had taken the project plan and a recent progress report with him, to show and convince the SG.¹² The plan gave a timetable. It showed that the PP should have been ready in April. The progress report nevertheless says that the project is proceeding according to plan. There were more untruths. Van Velsen gave the SG his report of the project.¹³ He told the SG that he had contacted an integrity officer. For the time being only to get informed and advised. He said that he would prefer self correction of the ministry to correction by external agencies.

The SG wanted to know if other people involved in the project could confirm this report. He wanted to talk with them as well. So about a month later the SG was visited by Endert and Van Velsen. Endert confirmed the report of Van Velsen. Whereupon the SG decided to ask the audit department to do a "quick scan" inquiry (audit).

On 13/12/07 the SG asked Endert and Van Velsen to drop by. The SG had just received the report of the quick scan.¹⁴ The report diagnosed a crisis of trust. HE didn't trust IFC. The report advised to work on restoration of trust. It didn't say how. The report didn't note that HE and the other education departments had good reason to distrust IFC. The report suggested that the main problem was that IFC and the education departments had different expectations. The report contained inconsistencies. The facts which it presented showed that IFC had informed the ministry incorrectly, also as regards essentials. The auditors concluded that further inquiry made no sense, and that no special measures were needed. The SG said that he was afraid that a more comprehensive inquiry would strain relations with IFC even more. He proposed to talk with uSG and the head of IFC about restoration of trust. He asked Endert and Van Velsen to think about the report and his proposal.

¹¹ To be precise: 11/10/07.

¹² This could and should have been sufficient proof and reason for action. But the SG didn't react at all to these documents; he ignored them.

¹³ That is: the first version of the first part of chapter 2, ending with the summer of 2007.

¹⁴ The report, of 3 pages, including a summary, is in the PPP-directory, under 20071204.

In a memorandum of 20/12/07 Endert and Van Velsen argued that the quick scan was inadequate. They asked the SG for a better one. They submitted questions which a further inquiry should try to answer. The SG said he agreed with them, and ordered a second audit.

2008, spring. The second audit.

Endert and Van Velsen never saw the report of the second audit.¹⁵ The SG only read out some of the paragraphs he said were the most important. They confirmed the assertions of Endert and Van Velsen. Except that the auditor thought that there was no malicious intent. Endert and Van Velsen disagreed. In their opinion it was impossible to explain the facts without the assumption of malicious intent.

The only time the SG said something positive about the efforts of Endert and Van Velsen with respect to the PPP was at the end of his reading from this audit report. The auditor concluded that there had indeed been misconduct, and that those who had reported it deserved appreciation. Looking up from the text, the SG said: “whereof notice is taken”.

He took no (observable) action. Nor did the uSG.

2008, autumn. The third audit and its consequences.

In a mail of March 2008 the heads of the education departments told uSG that notwithstanding great efforts nothing useful had come out of the PPP, and that the result could not be accepted. The mail explained why the departments didn't trust the technical and communication abilities of IFC anymore. The heads requested permission to look outside the ministry and its agencies for a company which was better equipped to make the desired product.

The mail caused many meetings on the level of heads of department and higher. They induced uSG to order a new audit. In one of the meetings she promised to formulate the instruction for the auditors in agreement with the education departments. She and/or DG Kerstens nevertheless kept only the letter of this promise, and gave the education departments almost zero time to read and comment the draft instruction before it was finalized. Fast action by the departments reduced the damage. Van Velsen informed the SG of the underhand procedure, which according to him (Van Velsen) was incompatible with the Code of conduct of the ministry. The SG denied this.

The report of the third audit was distributed on 24/11/08. The report asserts that IFC was able and willing to build policy portals. The report was neither impartial nor independent. It shows that auditors of the ministry don't work in agreement with their professional and integrity norms. It gives a far too rosy picture of the project and its results. In several cases it is untruthful. It does not acknowledge any serious error. As a consequence, it gives no recommendations which would help to avoid repetition. It doesn't want to look at the past, but only to the future. In other words: it doesn't want to learn from errors.

It had been agreed that the remainder of the budget for the PPP would be paid to IFC after acceptance of the result. In the mail of March 2008 the heads of the education departments had told uSG that the result wasn't acceptable. Their position hadn't changed. In the last days of 2008 uSG nevertheless ordered payment of the remainder.

uSG never spoke with the representatives of the education departments for the PPP.¹⁶ She never explained to them what she did and did not do with respect to the PPP. There is no evidence suggesting that she ever looked at the PP which she ordered to be built. She did however order the education departments to appoint other representatives, a “new team”, for the replacement projects.

¹⁵ Nor the specified request (order) by the way: the matters to be investigated, questions to be answered. No explanation was given for keeping the report secret.

¹⁶ Except of course the present author. But they never discussed the project as a project, only specific management aspects.

In December Van Velsen told the SG by mail that the report of the 3rd audit shows that the integrity problem of the ministry is much deeper and wider than he thought a year ago.¹⁷ He offered to formulate proposals for improvement. SG didn't reply. Because Van Velsen wanted to know what one can expect of this SG he explicitly requested a meeting. Because of the seriousness of the subject he wanted to be accompanied by his integrity officer. An appointment was only made after a reminder. The meeting took place on 9/6/09. According to the SG there was either no integrity problem, or it was solved by the merger (of IFC and IAG) and the reorganization. Things went well, and would go better. Van Velsen concluded that an open and meaningful discussion with this SG is impossible, and that this SG will not do anything to maintain the Code of conduct. That for this SG the code is no more than an instrument to mislead.

2009. Round up.

In the first months of 2009 there was an unstructured and intransparant discussion about the continuation of the PPP. There were no meetings with the education departments about this subject. The result was that two new projects were to be started: an project datawarehouse ("Getting production in order"?), and a project policy information. The most important observation is that the documents can only be understood if it is assumed that the PPP had produced nothing useful.

In other words: the facts clearly show that the education departments were right in concluding that IFC doesn't have the technical an communication abilities necessary for a project like the PPP. The facts show that SG, uSG and DGPS have done whatever they could to keep the failure hidden, up to and including ordering the audit department to violate the applicable codes. Nevertheless, by approving the replacement projects they implicitly acknowledged failure.

The delegated commissioner for the PPP, DGPS Rob Kerstens, did almost nothing with the signals about problems in the project, and about the incorrect progress reports. He did nothing effective at all.¹⁸ In other words: his incompetence as manager has been proven. The SG knew the facts. He nevertheless made Kerstens DGNEA, head of an organization of about 600 employees.

Director and deputy head of IFC Steven van Spijker and contract manager Frank van Loon of IFC were responsible for the IFC projects and the reporting about these projects. In several meetings where decisions were to be made about these projects they gave influential incorrect information. The first of these two men kept his high function, the second was promoted contract manager NEA.

SG and uSG have been shown unambiguous proof of integrity violations of IFC, and of structural incompetence regarding many essential aspects of project management. It is evident that they had much to explain. They never did. What they did was show that employees who report problems are sidetracked, and that denial of problems and help in covering up failure results in promotion.

The chapters 2 and 3 on the PPP and project and agency management have shown the extent of the integrity problem. As far as IFC projects are concerned it is nearly all-embracing. The failed appeal to the SG to enforce his Code of conduct has shown that the problem includes the audit department. It obviously includes the managements of the ministry and IFC. The section about the costs of Studylink in chapter 3 furthermore shows that at least the contract manager of IAG is guilty of unacceptable integrity violations. But also that the integrity problem of IAG cannot be limited to him. (Which will be confirmed in the next chapter).

In most cases the management ignores its own and professional norms for project management. There are no sound project proposals. The progress reports are not open and reliable, and practically useless for management purposes. Signals about problems from people close to the project are belittled or ignored. Messengers are misled or sidetracked. No corrective action is taken. On the contrary: new money is made available for more of the same. The management is characterized by lack of openness, transparency, reliability and mutual respect. Because their pious words are broadcast widely and most (mis)deeds are hidden, many employees are misled. Some collaborate. A few remain critical. Almost nobody can or does fight the corruption.

¹⁷ The mail is in the directory Integrity under 20081211.

¹⁸ As noted, not even the cover up was effective.

4.5. Words of SG and uSG.

The behavior of SG and uSG shown in the preceding chapters and section is incompatible with the Code of conduct signed by the SG himself, and with many of their public utterances. It is incompatible with the image they try to paint of themselves in interviews. The interviews do however show that they perfectly well know what is expected of them. In the interviews they implicitly acknowledge that the difference between words and deeds is important.

The following are examples of utterances of respectively SG and uSG which suggest a state of affairs which is almost the opposite of the reality shown in this report.

Words of the SG.

Don't obstruct good behavior.

In the section *Saying "yes" while doing "no"* of the article "Don't obstruct good behavior" (!) of the December 2003 issue of the magazine "Punt" of the ministry, the SG is heard to say:

«The cynicism about the changes [in the ministry], finally, is the most painful point that struck me. "Chaos in the ministry of education" was the heading of the Volkskrant Thursday last week.¹⁹ These are not my words, but they must come from somewhere. It [= the cynicism] should be eradicated by recognizing that things don't go well. One should diagnose well. And denial of the displeasure is very wrong». ^{20, 21}

Seven years after the quoted article, the Volkskrant could have run a story based on the chapters 2 and 3, and concluded that in such a environment cynicism is inevitable, and that SG Koos van der Steenhoven is its principal cause.

The following are examples of contradictions between the quote from Punt and the reality shown in the chapters 2 and 3 and above:

- Good behavior²² is definitely obstructed. In the first place by structurally ignoring prescriptions of de Code such as openness and mutual respect. And also for example by sidetracking people and formation of a "new team" (without any or without adequate explanation), and by promoting people who misbehave and fail systematically;
- Failure is admitted only in highly exceptional cases.²³ As a rule, errors and failures are covered up (contrary to the requirement of openness);
- Open diagnosis is obstructed, when "necessary" by pressuring auditors, and allowing or requiring them to ignore their (professional) codes of conduct;
- Justified displeasure is denied;
- Cynicism is not eradicated but created or enhanced.

uSG Simone Roos: honorable and transparent.

In his weblog of 13/7/09 the SG wrote:

«Simone Roos

After years of hard work for our ministry Simone Roos got another job. She applied for membership of the Council for the Administration of Justice, and was chosen. I can very well imagine that they chose her. Simone is a modern, ambitious civil servant, who knows how to tackle things. A

¹⁹ The Volkskrant is one of a group of approximately 5 Dutch newspapers with the most subscribers.

²⁰ The article is in the dossier under 20031200.

²¹ Perhaps the SG will object that this is not meant generally. But general formulations can be misleading. If the beautiful phrases are not meant to apply generally, the SG should explain when denial of facts is required, and when problems should not be diagnosed properly. Of course he will never do that.

²² Good behavior= behavior in accordance with the norms of the Code of conduct and the general regulation for civil servants ("ARAR").

²³ No significant example is known to the author.

role model, one might say. She combines the typical properties of a perfect leader: clear about the goals for everybody, good in giving compliments to people who deserve them, and in settling unwanted situations and behavior. Honorable and transparent. And I might continue like this for quite a while. It is difficult to choose a good successor for her»²⁴.

This isn't only quoted because of the untruths. The quote also shows that dishonorable and incompetent functioning is rewarded. And that the SG has no scruples about someone like that occupying an influential function in the top of the Administration of Justice.

The defense that at farewell parties one should only say nice complimentary things is irresponsible, and incompatible with the Code of conduct. But even when it is admitted that on such occasions there is only place for niceties, there is still no need for lying. After all, almost everybody has some positive qualities. In other words: it is almost always possible to say nice things without violating the truth.²⁵ And if not, then one can better keep one's mouth shut and say nothing.

Note by the way that SG and uSG said nothing or nothing positive in quite a few situations where that would have been no more than natural and good management.

Don't be afraid that it will be held against you.

Chapter 2 gave the following quotes from weblogs of the SG from January and February 2006:

22/1/06: «This meeting will lead to an even better working IFC, even though this would seem hardly possible if you know how much they already did in the recent past.»²⁶

12/2/06: «Sometimes the quality of services rendered by our colleagues in Zoetermeer is perceived differently by colleagues in The Hague. In my weblog of 22/1/06 I was rather positive about them, but that was not received with thanks by everybody. Some people commented very critically about IFC. On the one hand this is regrettable, but on the other hand it informs me of facts which would remain hidden otherwise. So, if something goes wrong, let me know! Don't keep it to yourself, don't deny the problem. Speak up, then something can be done about it. Don't be afraid that it will be held against you, for that's not how we work in this ministry.»²⁷

These quotes can be seen as an example of integrity and professionalism as communicating vessels. It was unprofessional to trust an interested party at its word, without any check. In the time between these two weblogs the SG had been shown (not only told) that IFC (at least) sometimes misbehaves and fails. But in the weblog of February the SG acknowledges no mistake by himself (rash judgment), nor any failings of IFC. He doesn't even admit of the possibility of such failings. Without undue insult, he could have said that even IFC isn't perfect and sometimes makes mistakes. He didn't.²⁸

Of course, it has been clearly proven in the preceding chapters that criticism is held against the messenger. The fear and silence of the overwhelming majority of the employees is only too justified.

In principle a civil servant should serve every political leadership.

The following paragraphs from the weblog of 25/5/09 consider the question whether requests (interests?) of members of the government are more important than integrity:

«The present discussion about the PVV and civil servants is an interesting one.²⁹ There are civil servants who have publicly declared already that they don't want to serve under a PVV minister. Commentaries immediately connect this with the Second World War. You know: Queen Wilhelmina and her government moved to London, and ordered the SG's to stay and keep doing their job. Some SG's have been reproached for this.³⁰

In the meantime minister Ter Horst has given a correct answer to the question from parliament what she thinks of civil servants who don't want to stay if the PVV becomes part of the government.

²⁴ Weblog 232 of 13/7/09.

²⁵ At least if half truths are counted as truth (which I don't).

²⁶ In the file with the weblogs, search for "22-01" or "week vol met hei".

²⁷ In the file with the weblogs, search for "12-02" or "heisessie".

²⁸ Not in talks with Van Velsen either.

²⁹ The PVV is a right wing political party.

³⁰ The Dutch text (too) is not as clear as it could have been. The SG seems to avoid unambiguity.

Namely that a civil servant should in principle serve, and be able to serve, every political leadership. The Dutch civil servant is by definition loyal to the political leadership, irrespective of its color.

Another situation arises when the civil servant is asked to do things contrary to the law. In such a situation a civil servant can refuse to do what was ordered.³¹

I agree with the argument. You do your job, until you are confronted with a situation which isn't lawful. Then you run amok,³² and that could mean leaving your job of civil servant.³³

The SG doesn't seem to know that even the most criminal governments have laws, and that lawful cannot be equated with "acceptable" or "good". He doesn't seem to realize that national laws can be incompatible with international laws, and that neither requires integrity. He doesn't even mention human rights. Very strange is the opinion that a civil servant should resign if his organization (systematically?) violates the law. Shouldn't there be legal instruments enabling a civil servant to take effective action against such violations?

Both Ter Horst and Van der Steenhoven seem to assume integrity of every political leadership, or create ambiguity about the relative importance of integrity. They ignore the problem of survival "as good as possible" under a repressive government.

The opinions in the quote, together with their vagueness and (implicit) contradictions, are consistent with the events described in the preceding chapters. These events would be unthinkable if the SG were able to reason consistently about integrity, if he really believed what is written in the Code of conduct, and if the wanted to live and work in accordance with it.

Erwin has to do what was agreed.

Erwin is a pupil who is coached by the SG. In his weblog of 11/4/10 the SG writes the following:

«Erwin has a new schedule, which he didn't send me. I'm making a point of that. After all, agreements should be kept. He was scared. In the future he will do what was agreed.»

So the SG knows very well what is proper, and what he has to say to get a positive appreciation from his audience.

Words of the uSG.

As regards uSG Simone Roos, the chapters 2 and 3 and the preceding sections show that her words have no connection with the practical reality of the ministry.³⁴ In particular with respect to integrity and project management. The interpretation which is most favorable for her is that she thinks she is a God. Who only has to speak to change reality, automatically and faithfully. She doesn't supervise implementation, and seems not to know what happens in the ministry (and its agencies). As a member of the Council for the Administration of Justice she has a very important social position. To better understand such people and their selection, it may be useful to compare her behavior as shown in the preceding chapters with what she tells about herself in interviews.

I like things to run well.

The September 2009 issue of the magazine PM ("for decision makers in public administration") has an article "The move of... Simone Roos to the Council for the Administration of Justice".³⁵ With the main title, in fat capitals: "Not afraid of new things". The article suggests that she could react to a number of questioning remarks, or keywords. In reaction to "Lies awake from" she wrote:

«I'm happy not to be of the worrying kind, and mostly sleep like a log, but may lie awake if important things don't go as I want. If I don't feel in control, in balance. That can be personal or work related. I'm a quite a perfectionist, and like things to run well».

In reaction to "Headache dossier":

³¹ If the law permits refusal!

³² This wouldn't make much sense, and one wonders whether the SG knows what this means.

³³ This is weblog 225. Search for "25 mei" or "Participatieportaal".

³⁴ Unless hiding and covering up are seen as a connection.

³⁵ In the directory Integrity, under 20090911.

«As uSG I was in charge of the digitizing project Edoc, which was aimed at the transition from paper to digital. Everybody, at all levels of the organization, has to take part. Technically the project is almost completed, ready to be rolled out, but it is terribly difficult because you have to change the behavior and culture of your people. It needs a lot of cooperation, but many people just don't like change, and don't see the use of it. The vulnerability of the project is its width. It is very difficult to get the whole organization so far, while at the same time this is connected with a big risk of failure».

Edoc digitizes little. The system should integrate things which had already been digitized, digitize procedures for signing formal documents, and decentralize the official archive. When Roos left, a third project leader had just been appointed. After a failed pilot a restart would be made with a new ordering structure. Edoc was far from ready to be rolled out, at least with a reasonable chance of success. What Roos means with “technical” isn’t clear. But in the beginning of 2010 many important adaptations of the generic software to the ministerial environment remained to be made. Note that Roos doesn’t explain why Edoc hasn’t been rolled out yet. She claims that a change in the behavior and culture is necessary. She doesn’t add that she has done absolutely nothing to realize that change, or to convince her people of the use of Edoc, and the improvements it would bring (if any...³⁶). In the project Edoc she was just as absent and uninterested as in the PPP and other projects mentioned earlier.

In the introduction to the interview the editors of the magazine wrote the following about Roos’ career:

«During her law study in Amsterdam she acquired a juridical-management-scientific background, got acquainted with the practice of the world of management at the Association of Dutch Municipalities (ADM)³⁷, and learned management in public administration. In addition her experience as a project director of the change program “Apollo” in the ministry of education will come in handy. Roos: “Much has changed in the ministry in the past eight years, and in the administration too there will be change. The revision of the judicial map is a far reaching operation. It requires people acquainted with change management”».^{38, 39}

Someone sincere, open and honest.

This is not the only instance where uSG suggests to be an experienced and competent change manager. In her farewell interview in the Punt of September 2009 she is quoted as having said:

«Besides these experiences at ADM my management experience in public administration comes in very handy. The more so since the Council asked for a lot of “change experience”, because the administration of justice is on the eve of substantial changes, such as a revision of the judicial map of the Netherlands».

After having read that she finds it “terribly difficult” to change people’s behavior and culture the following paragraph may surprise:

«What I’m very proud of, is the speed with which we succeeded to order the organization of the ministry. [...] The organization actually improved in no time, as confirmed by the audit service and the [D]GAO».

Didn’t this require a change of behavior and culture?⁴⁰ It seems clear anyway that Roos wants the reader to believe that the organization of the ministry is in order.⁴¹ And that we should be grateful to her for accomplishing that.

A little later in the interview we read:

³⁶ Nobody was sure. Some people thought Edoc was only meant to support budget cuts on archiving. Lots of people had already been fired, and more were to follow. Of course, due to “unforeseen” difficulties and many extra costs in the project this may have been, or probably was, a result of gross miscalculation.

³⁷ ADM in Dutch: Vereniging van Nederlandse Gemeenten (VNG).

³⁸ The present author was involved in part of the Edoc project. But at the time he couldn’t spend much time on it. As a consequence he cannot give a meaningful description and evaluation. It certainly is an interesting case, even though “added value” for the present report may be limited or absent.

³⁹ Note that the quote, and the interview-article as a whole, are examples of irresponsible and misleading journalism. Clearly no serious checks have been made.

⁴⁰ Probably little or nothing, for the project was mainly fake, empty words. There wasn’t much ordering to do actually.

⁴¹ Though it isn’t clear what she means by “the organization of the ministry”.

«How do you want your staff to remember your leadership? “I hope that they think of me as someone sincere, open and honest, human, but also as somebody who wants you to keep your promises. The biggest compliment they could make me is to find me trustworthy. This at least is what I tried to offer. And that is different from being thought of as always kind. For the other people in the ministry, the people I didn’t manage, I hope to have been someone who knew how to achieve things forcefully”».

Trustworthy and forceful! You may not believe your eyes, but this is really what she is supposed to have said.

In short: what Roos says is almost the opposite of what she did. She is an example of extreme deceit or self-deception. The last corresponding with a complete lack of self-knowledge and self-criticism. And like the SG: she knows very well what is expected of her.

Remark and two observations.

One has to conclude that SG and uSG are first of all play-actors who employ words (and power) to keep up appearances. Maybe their cheating is meant to serve a higher purpose which is never publicly accounted for. But the cheating may just as well be a consequence of specific mental abnormalities. Regrettably psychology offers neither insight nor explanation. But whatever the explanation, it doesn't make SG and uSG suitable for their functions. Neither does it relieve them from responsibility and liability for the damage they caused.

The facts presented give rise to the question how these people have been evaluated when they were selected. Have their words been trusted blindly? Or have they been selected expressly because of their ability to act and lie unnoticeably (“perfectly”)?

Some other aspects of integrity become visible through the following comment by Richard Pauwels on reactions to weblogs of the SG:⁴²

«Private life in Weblogs of the SG

For once I would like to let you hear something positive about the Weblogs of the Secretary-General. Besides typical work related matters he also discusses events in his private life. He mixes them into an amusing and informative Weblog with information which is really useful for us as staff members. In a short text he gives much important information which we normally get in long letters only, or not at all. He furthermore has an eye for life outside the ministry: the events at home. He only does this marginally and in a concise and meaningful way. For just like him the average employee of the ministry too has this kind of experiences.

In this way he shows that nothing human is alien to him, and that he is one of us, and imagines himself in our position with respect to for example the reorganization and staff reduction. We're in luck with our top manager. Which is positive!

Why then always these poor spirited reactions to his Weblogs by people who seem to have gotten out of bed on the wrong side? Be positive! Where is the real ministry-of-education-spirit!»⁴³

The text suggest a continuous stream of negative reactions on the weblogs. Regrettably it doesn't give examples. The present author has seen critical reactions only very rarely. He doesn't understand what Pauwels refers to.⁴⁴ In any case there never was a real discussion between the SG and someone who had reacted critically. Perhaps Pauwels considers everything poor spirited or negative if it isn't downright laudatory.

The “one of us” and the “real ministry-of-education-spirit” suppose a group spirit and uniformity which don't exist in the reality of the ministry.

Pauwels works on the same floor (of 15 floors) as the three members of the government responsible

⁴² The reaction is of Wednesday 28 April 2010, 08:47.

⁴³ You may think too much attention is paid to this almost ridiculous bootlicker. But don't forget that this person has a relatively important position in the ministry. And more important: understanding people who form and maintain the given system is one of the most important goals of the present report (study). It isn't sufficient to know the top. It is just as important to understand why they are supported and (more than) obeyed.

⁴⁴ Of course, this excepts the reaction of Van Velsen of January 2006, quoted in the chapter on the PPP.

for education,⁴⁵ the SG, uSG and DG's. He works in the department which supports these people.

In more than 25 years at the ministry the present author has met very few or no people who would write a text such as that of Pauwels. But there are two things the author finds even more amazing than such a text. Namely the ability of his superiors to select someone like Pauwels, and the fact that they want such a mindless bootlicker as an assistant.

To complicate the puzzle some more, I quote Gérard Maas, an integrity officer of the same ministry:

«I think that it is positive that we have relatively few reports of integrity violations. Of course this may be a consequence of the fact that this ministry is not directly involved in major streams of money, and therefore less tempted to slips or missteps. But I think the most important reason is that we have a decent organization, where colleagues with strict norms are willing to address one another on the integrity of their behavior».⁴⁶

This is written under the heading “Transparency is the basis”.

Direct involvement is ill defined. The logical necessity is not particularly clear.⁴⁷ The budget of the ministry of education is the third largest of the Dutch ministries: in 2009 it spent over 30,000 M€.⁴⁸ In other words: Maas' argument doesn't show that the temptation is relatively weak. But Maas may believe it. And maybe he doesn't see, or misinterprets what he sees. Or all of this.

4.6. Quotes from the Code of conduct of the ministry.

The Code of conduct of the ministry of education was introduced in 2005, when Van der Steenhoven was SG.⁴⁹ His signature is under the foreword. The first sentence of the foreword is the following:

«Our conduct with respect to each other and the outside world should be open, service-oriented, respectful, impartial, and reliable. In a single word, honorable».

The following is from pp. 4 and 5:

«The code applies to everyone working in the ministry of education. [...] The managers have a specific role. Their conduct should be exemplary. They should be aware of this, and be open towards their subordinates about their conduct in certain situations.

[...]

Rules of thumb are:

- Act in the spirit of this code when the occasion arises;
- Don't do anything you wouldn't dare tell your superior, colleagues or in public;
- Be open about dilemma's. Discuss them with your manager or colleagues. If you don't want to discuss certain situations with your manager or colleagues, you can go to an integrity officer».

The following is from pp. 7 and 8:

«The management team of the ministry finds the following central values of the utmost importance. They show how the ministry wants to work. They have an internal and external effect: they concern both our mutual relations as colleagues and our relations with outsiders.

- Subservient and respectful conduct

We treat citizens, relations in the education sector, and each other correctly and respectfully.

We take opinions, views and contributions of other people seriously. We help and stimulate

⁴⁵ And science, culture (including media and museums) and emancipation.

⁴⁶ P. 21 of Punt 9 of 2010. This page can be found in the directory Integrity under 20101008.

⁴⁷ For example Wilbert van den Berg and Jo van Ham, former heads of the department of HE, got nice jobs in the top of universities after they left the ministry. The ministry is certainly directly involved in “budget defense”: in efforts to prevent reduction or realize budget growth. Success may be rewarded. What is a salary of 200 k€ compared to an institutional budget increase of say 10,000 k€?

⁴⁸ Thirty billion. P. 82, 20080909_Miljoenennota 2009_Tekstgedeelte. In the directory Integrity.

⁴⁹ The Code can be found in the directory Integrity, under 20050620.

colleagues, are open for criticism, and handle it constructively. Central concepts are customer orientation and cooperation.

- Impartiality/ Independence
Civil servants represent the general welfare. Therefore we should evaluate on purely objective grounds, and not allow improper or personal motives to play a role. We should not favor one citizen or institution more than another. Decisions about exceptions have to be taken on objective grounds. Every appearance of intertwining of interests should be avoided.
We do our job in the framework of the political responsibility of the minister. This means that our work should be directed primarily at the realization of the policy goals of the minister.
- Transparency/ Openness
We cooperate in an open way. This means that we inform one another correctly, exchange the right data, and do not withhold information.
We motivate each other and cooperate to obtain results. We do this by involving the right colleagues at the right time, and by exchanging arguments, information and ideas. We explain what contribution we ask of each other.
We are open about our goals and purposes in our external communication too.
- Reliability.
Reliability means that the citizen must be able to trust that we keep agreements and promises. This trust stands or falls with the reliability of the individual civil servant. With respect to your colleagues too: say what you do, and do as you say.
Reliability also means that we do our work carefully, and handle (confidential, politically or privacy sensitive) information carefully. We use this information only for the purposes for which it has been provided.

[...]

Elementary rules of conduct are:

- “Saying yes” means “doing yes”;
- Be clear about what you need of someone;
- Give your opinion when appropriate, and don’t gossip;
- Differences of opinion are necessary, but should be settled;⁵⁰
- You may make mistakes, but not intentionally, and not twice the same mistake;
- Advise quickly, follow suit, and be assertive».

The chapters 2 and 3 (and 5) clearly show that this is no more than empty talk.

4.7. Reality check: some facts of the case Spijkers.

After having been confronted with so much conflicting information it is quite understandable that a reader doesn't know what to believe. This section is inserted to help the reader keep in touch with reality. This goal can probably best be realized by telling the history of J.J. Spijkers. This is probably the best example because:

- Everyone can easily check the facts on the internet;
- It concerns avoidable causation of lifelong suffering and loss of life;
- It is a relatively simple story;
- It is clear that Spijkers was right (and the others wrong);
- The harassment of Spijkers (by members of government and their dependencies) has no equal in recent Dutch history;
- The case shows that many people have actively and knowingly contributed to deceit, knowing this would hurt innocent people;
- No legal means were available to force the political powers to end their extreme misconduct. In particular, no “human rights” could be invoked.

⁵⁰ This assumes that this is always possible. Which it isn't. See *Communication and norms*, or *The law of logic* (Het recht van de logica, Eburon, Delft, 2003).

The history furthermore shows that from all the organizations which have contributed to make the case as shameful as it is, nobody leaked crucial facts to media, or stepped forward to effectively defend Spijkers. (A few people did help, but were not sufficiently powerful to be effective).⁵¹ In other words: even in cases of very serious and clear violations, where everybody in the know should blow the whistle, almost everybody keeps silent.

The following chronicle only presents events which show persons or organizations which clearly violated integrity norms.⁵² The names of these persons and organizations have been set in italics.

1970.

The *Royal Dutch Army* used mines of the type AP-23. The mine was produced by a company called *Eurometal*. Since 1970 the army knew that this mine was seriously defective.

1983.

On 18/7/83 in a classroom in the town Oldebroek there is an accident with an AP-23 mine. Five soldiers are killed, eleven wounded, of whom two so heavily that their lives are threatened.⁵³

1984.

On 14/9/84 mine expert Rob Ovaa is killed by an accident with an AP-23 mine.

At this time Spijkers is a company social worker at the ministry of defense. He is requested to tell the widow of Rob Ovaa, Marjolein Ovaa, that her husband has died as a consequence of his own mistake. But because of the earlier accidents Spijkers suspects that mines of this type are defective. In his conversation with the widow on 14/9/84 Spijkers lets it transpire that he was sent and did not agree with the message.

Subsequently Spijkers starts an inquiry. He discovers that the defectiveness of the mines was known since 1970. Whereupon *his manager* asks the *Information Service of the Royal Dutch Army (ISRDA)* and the *Information Service of the Royal Dutch Marine* to investigate Spijkers.⁵⁴

1985.

A secret investigation of *the military police* asserts that Rob Ovaa had been imprudent. Therefore the widow could not claim damages.

1986.

On 13/5/86 Spijkers is qualified “political criminal” by the *ISRDA*.

1987.

Spijkers is examined psychiatrically. *Company doctors* declare him paranoid and schizophrenic. He is declared unfit for his job.

1988.

Spijkers successfully fights his dismissal. But *the top of the ministry* doesn’t allow his return.

1989.

In front of the McDonald House in Huis ter Heide *two soldiers* shoot at Spijkers. Spijkers isn’t hit. The soldiers get disciplinary punishment.

1991.

⁵¹ And the powers that be didn’t respond.

⁵² The sources are De Pers (a daily) of 6/3/08 and the Dutch language Wikipedia of 7/6/11. Editing was mostly limited to abbreviation. Qualifications of persons or organizations are copied from the sources. The sources can be found in the directory Spijkers.

⁵³ De Pers of 6/3/08 says that 7 died, and 9 were crippled for life.

⁵⁴ In Dutch: Landmacht Inlichtingendienst (Lamid) and Marine Inlichtingendienst (Marid).

Spijkers contests the falsified medical report. *The commission of appeal of company doctors* rejects his complaint.

1993.

Spijkers wins a lawsuit. But he loses his unemployment benefit because he refuses to sign a declaration stating that he is unfit for work. (*Unknown organization(s)*). He is jobless and without income.

1997.

The ministry of defense appeals against the lost lawsuit at the Central Appeals Council (CAC), and wins. The media report about a prejudiced judge *Vermeulen*. Government lawyer *G. de Groot of the firm Pels Rijcken & Drooglever Fortuijn* knowingly gives the CAC incorrect information. With his lies he unjustly makes a fool of senator J. F. Glastra van Loon, who defends Spijkers.

The chairperson of the Tweede Kamer, Jeltje van Nieuwenhoven, tries to prevent that members of parliament ask the under-minister of defense “difficult” questions.⁵⁵

1998.

Per 1/9/98 payment of Spijkers’ income and pension benefit are stopped. (*Unknown organization(s)*).

1999.

In pursuance of reports in the media about the case Spijkers, national ombudsperson Oosting starts an inquiry into the AP-23 accidents of 1983 and 1984. The ombudsperson calls the attitude of the ministry of defense in this case “shocking”.

2001.

In a report requested by under-minister Van Hoof of the ministry of defense, KPMG⁵⁶ writes that for years Spijkers and the widow of Ovaa have been misled on purpose by *the ministry*. [What did and does parliament do? JFCvV]

2002.

A battle of years is followed by mediation by the national ombudsperson and an inquiry by KPMG. In a settlement agreement of 29/11/02 *the ministry of defense* acknowledges that for eighteen years it had systematically misled Spijkers, parliament, the media and society.⁵⁷ Spijkers is promised damages, and compensation for legal and medical costs.⁵⁸ Spijkers will be rehabilitated, and qualifications like “political criminal” and “political psychiatric case” will be purged from his files. Marjolein Ovaa and her children will be paid damages too. Both Spijkers and Ovaa will be awarded royal honors. Spijkers will be compensated for non payment of salary by the ministry in 1993-2011.

2003.

Spijkers is given 1.6 M€ tax free damages. After questions of Krista van Velsen in parliament, under-minister of defense *Van der Knaap* promised to get the promised royal honors awarded to Spijkers.

2005.

On 29/8/05 *Van der Knaap* tells parliament that the archive of the case Spijkers will become publicly accessible only 50-70 years after Spijkers’ death. He also says that he will not reimburse legal and medical costs.

⁵⁵ A “difficult” question is a question that cannot be answered in an acceptable way without seriously endangering the position of the person giving the answer.

⁵⁶ The accountancy and consultancy firm.

⁵⁷ For eighteen years!!! Again: what did and does parliament do? There certainly was no control!

⁵⁸ Note that “the ministry” need not mean more than the top of the ministry, and includes the minister. A ministry is not a democracy, and even in a democracy only the least majority (of “representatives”) is needed for a decision.

In September Spijkers receives a tax assessment of 0.9 M€ because of the 1.6 M€ damages. Like the non reimbursement this is contrary to the settlement agreement. (*Ministry and Van der Knaap collaborate*).

2006.

In October the book “Man against the State” by Alexander Nijeboer is published. It gives a rather detailed account of the case Spijkers, at least of the part that is publicly known. It shows that in their information of parliament members of the government lied 49 times. Van der Knaap misled parliament at least 20 times. The book concludes that notwithstanding the settlement agreement of 2002 Van der Knaap still refuses to correct the results of the fraud wherever possible.

2008.

On 21/1/08 Van der Knaap becomes mayor of the town of Ede. He keeps this position until his retirement (30/8/17).⁵⁹

In March the magazine “Public management” publishes a paper with the results of an inquiry into the case Spijkers by a team of scientists from Amsterdam University. The title is: “A constitutional state without self-criticism and self-correction”. It concludes that Spijkers’ life has been destroyed by political, governmental, and judicial officials in the name of the Dutch state. Instead, they should have praised Spijkers. For 23 years they misused their official powers and means to commit injustice. They may be called “bad” or “malicious” because of their indifference to this injustice. They have done this to save their skin, or in the perceived interest of their ministry or political party.

In April the municipal council of the town Culemborg decides unanimously to send a letter to *prime minister Jan Peter Balkenende*. It asks Balkenende to “step over his own shadow” and to accept responsibility for the liberal implementation settlement agreement of 2002. The council had written a similar letter in March. Balkenende’s reply is judged too meagre and formalistic.

In May a number of political parties calls upon under-minister Jack de Vries of defense to try and reach agreement with Spijkers. The signatory parties have half of the seats in parliament.⁶⁰

In July it becomes known that *Balkenende* has pressured Pieter van Vollenhove, chairman of the Research Council for Safety, to withdraw his offer to act as mediator between Spijkers and the ministry of defense.

At this point we let the chronicle rest.

The chronicle shows that behavior which is incompatible with integrity is widespread, and dominates other behavior. Lack of integrity is not the exception but the rule. Even when it is clear that the misconduct causes very much harm and suffering. For more than twenty years almost everyone concerned is doing as if “defense of defense”, including denial and cover up of wrongdoing, is an inviolable priority.

The case shows that in the much praised constitutional state of The Netherlands somebody who resists wrongdoing by government officials can be defenseless against their unjust and illegal retaliation. In other words: that in this state common people have insufficient means to defend themselves against unjust and unlawful treatment. And that this implies that government officials don’t have to worry about consequences for themselves, and employees have to fear the worst (a fate like that of Spijkers).

Finally we note that:

- Nothing is known of any action taken by the *General Accounting Office*. Even though it asserts that its goal is “to evaluate and improve the licit, efficient, effective and honorable functioning

⁵⁹ Cees van der Knaap was born 27/1/51.

⁶⁰ This is from the Wikipedia. It doesn’t say whether they have a majority...

- of the government and related organizations".⁶¹ Are defective mines licit and efficient? Were the amounts of money the ministry of defense spent on cover up and on the persecution of Spijkers licit and efficient? Let alone honorable. Was there no good reason for remarks or an inquiry by the DGAO, already in 1983? (Of course there was);
- Already after the first accident (all employees of) Eurometal could and should have given full and correct information about its product;
 - "Independence" of persons or organization doesn't guarantee independent evaluation and behavior;
 - Nothing is known of actions taken against those responsible for the wrongful use of the AP-23 and the harassment of Spijkers;
 - Parliament has never taken effective action;
 - Parliament has approved the hiding of the archive, and thereby helped preventing that the law can take its course;
 - Publicity by the media did not prevent over twenty years of extreme harassment. It didn't inspire parliament to take effective action, to claim damages from those responsible,⁶² or to ensure preventive punishment.

4.8. Improving integrity in public administration: OPIPA and DGAO.

Government officials and government publications regularly try to give the impression that the government gives high priority to integrity, and that the government and associated organizations work in accordance with strict standards of integrity. The formation of an Office for the promotion of integrity in public administration (OPIPA) can be seen against this background. OPIPA began its activities in March 2006. According to its factsheet: «OPIPA wants to stimulate that organizations related to the government have a wide, purposeful and effective integrity policy, which includes a coherent set of measures».

Publications on specific subjects.

Summary. The publications mentioned are useful but superficial, insufficient and ineffective. They fail to compare the theory with the reality shown in the case Spijkers (and cases to be treated in chapter 8). Comparison with the reality of the case Spijkers would show the theory to be fatally flawed. Moreover, even if the publications told all there is to tell about motives, causes, etcetera, these motives, causes, etcetera are not addressed by the present measures, regulation, codes and policy.

Publications are an important instrument for the realization of the goal of OPIPA.⁶³ One of them is the *Guideline: The integrity officer and the relation with the (top)management* of 2008. The following is a quote from this publication:

«For integrity policy to be effective, and for an integrity officer to be able to function optimally, the management should at least:

- tell and show that it attaches great importance to integrity;
- be pro-active and bring up integrity questions and dilemma's;
- be an example of integrity in words and deeds;
- abide by agreements, rules and procedures;
- know and know to find the rules, and make them known and followed;
- have an eye for, and link up with (dilemma's in) daily practice of employees;
- prevent that its behavior seems to be incompatible with its words;
- dare to be vulnerable;
- address employees and colleagues with respect to the integrity of their conduct;
- accept responsibility for the organizational structure and -culture;

⁶¹ Factsheet of the Dutch GAO, June 2010. In de directory Integrity, under 20100600.

⁶² Without which only the taxpayer is charged.

⁶³ Several of them can be found in the directory BIOS of this chapter. (BIOS is the abbreviation of the Dutch name of OPIPA).

- be accessible (open door policy, make time available, be willing to talk, to discuss questions or dilemma's);
- have a straight back and act resolutely when necessary, irrespective of rank and station;
- provide sufficient means for integrity policy (time, money, human resources, schooling)).⁶⁴

As shown, all of these prescriptions are violated wherever deemed necessary to deny and cover up misconduct and failures. Which means structurally.

Another publication is the “Help brochure” *Motives for dishonorable conduct. Social psychological factors of 2010*.

«This help brochure tries to answer questions like:

- Why do people do things they are not allowed to do?
- Why do employees break the rules of the organization?
- Why do other employees decide honorably?»⁶⁵

The answers of the help brochure can be compared with the known examples of dishonorable behavior. This shows that they give at most part of the answers. In addition the answers don't match the integrity policy. These assertions are substantiated in the following.

The help brochure claims to present the results of recent research on the behavior of people in organizations by social and organization psychology, and the management and policy sciences. As “important, typical” insights it mentions:

1. It isn't always simple to identify a single indisputably wrong action;
2. Often there is a gradual process consisting of actions each of which can be judged differently;
3. There can be conscious and subconscious, rational and emotional causes of the behavior;
4. There is no clear character profile with respect to corruption;
5. There are insufficient counter forces.

As frequently occurring “factors and mechanisms” are mentioned:

1. Denial of normative aspects, and/or reasoning them away;
2. Choosing the easiest way, and finding an excuse for that, such as: “There is no real choice” or: “This is the responsibility of X”;
3. Ambition;
4. Influence of authority. «In general people do as they are told. Furthermore, implicit or explicit behavior of managers has an important influence on subordinates, and is an important integrity factor in an organization»;⁶⁶
5. Identification with a role or duty, coupled with absolutizing instead of relativizing the importance of this role or duty;
6. Conservatism: sticking to a chosen line, and lack of willingness to reflect and change;
7. Conformity to group behavior, avoidance of “deviant behavior”;
8. Organizational incentives. «People tend to do what is rewarded, and to avoid what is punished. This may seem logical, but there are still quite a few organizations where honorable conduct is not (explicitly) stimulated and dishonorable conduct isn't punished or sometimes even (implicitly) rewarded».⁶⁷

Undoubtedly these insights, factors and mechanisms are relevant. Both 5 and 6 in the list of factors and mechanisms can easily lead to fatal derailment if they affect the top of a large organization. For example if it is imagined that the public image of the organization or its head are goals in themselves, that the end justifies the means, and if interests (including norms) are weighed arbitrarily.

Still, the insights, factors and mechanisms explain almost nothing of the reality shown in the case Spijkers and the many other cases studied in this book. A striking omission seems to be the insight that

⁶⁴ P. 8.

⁶⁵ P. 7.

⁶⁶ P. 15.

⁶⁷ P. 17.

efforts to deny or cover up mistakes and failures are an inexhaustible and cancerous source of integrity violation.⁶⁸ And the insight that in hierarchical organizations this mechanism can poison the entire organization. In fact, the list doesn't mention any fundamental cause of non-integrity. Such as a discrepancy between duties of a job, and actual abilities. On the other hand, the ambition of point 3 need not cause misconduct. It only does when it makes a person accept a job he cannot fulfill properly.

But even if the publication would have mentioned all relevant causes, this nor other publications try to answer the question whether existing regulation sufficiently addresses them, or cancels their effects. Are the counter forces sufficiently strong? Is dishonorable behavior sufficiently discouraged and/or punished? Again the case Spijkers is ample evidence of the answer "No, not at all".

The assumption that people try to do what is rewarded, and to avoid what is punished, is one of the grounds for criminal law. But it seems to be unknown in the integrity policy of the Dutch government, its whistleblower regulation, and the *Code for good public management* to be considered below. They don't ask themselves what it means that the whistle was blown for good reasons. They don't ask themselves what the good reasons say about the people who caused the good reasons. No attention is paid to measures for prevention of repetition, and/or punishment of those responsible. Shouldn't justified whistle blowing have consequences for those who gave rise to the need to blow the whistle?⁶⁹ Can such people be said to be sufficiently competent and honorable for their jobs? Nothing is said about these questions.

In spite of "factor or mechanism" 8, the whistleblower regulation of 2009 creates serious risks for whistleblowers, and none for those who give cause for whistleblowing.⁷⁰ According to article 28 of the regulation, costs for legal assistance will be reimbursed to a maximum of 5000 €. But only if the judge's verdict implies that the whistleblowing was justified. Everybody who is acquainted with the costs of lawyers knows that 5000 € is a trifle. It can be compared with the 81,000 € Spijkers had to spend on legal costs to force the ministry of defense to fulfill the terms of the settlement agreement.⁷¹ Of course, this was only a minor part of the costs Spijkers had to make in 1984-2002. No limit should have been mentioned in the regulation. At least as long as the opposite party is allowed to spend unlimited amounts. According to De Pers of 6/3/08 under-minister Van der Knaap alone has spent 700,000 € in efforts to cover up the dossier Spijkers.⁷² Limitation of the costs of only one party yields inequality in legal assistance. And why shouldn't the responsible managers⁷³ have to pay the costs if the judge puts them in the wrong? Why are whistleblower and management treated differently? Why is the management, and not the whistleblower,⁷⁴ supposed to represent the organization, even if the verdict could imply that it is unfit to lead and represent the organization?

The yearbooks Integrity.

Since 2010 OPIPA publishes a Yearbook Integrity with interviews and articles.⁷⁵ The articles are mainly theoretical. They may be correct- in a certain sense- and even somewhat useful, but they almost always ignore an essential part of reality.⁷⁶ None of the contributions betrays understanding of the functioning of hierarchical organizations. Nobody suggest that proven misconduct in ministries should have consequences for the responsible managers and members of government.

The conclusion of the analysis of the yearbooks is similar to the conclusion about the other OPIPA publications: they may be interesting and useful, but have no more than marginal significance. The

⁶⁸ The omission is striking because the phenomenon is well-known from politics.

⁶⁹ Yes, the need. For whistleblowing supposes that internal complaints have failed. In other words: the organization and its management have failed to operate appropriately.

⁷⁰ The regulation can be found in the directory Integrity under 20091215.

⁷¹ Source: letter of under-minister De Vries of defense of 4/9/08. In the directory Spijkers, under 20080904.

⁷² Unhindered by parliament or DGAO.

⁷³ Of course, including the responsible members of government, like Van der Knaap.

⁷⁴ Or both of them, or neither.

⁷⁵ The yearbooks 2010, 2011 and 2012 are in the directory OPIPA. The yearbook of year N is published at the end of year N-1. The yearbook 2010 for example was published in November 2009.

⁷⁶ Essential because it falsifies most theories about good government.

reason is that they ignore a crucial part of reality, and principal causes of integrity violations.

By ignoring inconvenient parts of reality, OPIPA and its experts make themselves part of the integrity (and competence) problem. They waste money, and preclude effective measures.

The yearbook 2011 contains an interview with Saskia Stuiveling, president of the Dutch General Accounting Office (DGAO). Some of her remarks concern the report of an inquiry into systems of integrity care in organizations in public administration. In order to be able to evaluate the remarks the present author studied the report in some detail. The conclusion is that like the ministries of education and defense, Stuiveling and the DGAO falsely claim integrity.

OPIPA and DGAO are fully paid by taxpayers' money. They are (should be) supervised by government and parliament. There is no evidence showing that they really are.

Yearbook 2010.

This yearbook has an interview with Andrée van Es, DG at the ministry of Internal Affairs. The interview has the title: *Everything you do should be able to bear the light of day*. She explains:

«Integrity requires transparency and openness. Confronted with a dilemma, the question every manager, and even every civil servant, should ask himself is: can I tell and explain the public? Can I be open about this? If not, alarm bells should begin to ring. "In case of doubt: don't" says Van Es».⁷⁷

It is clear that these words have nothing to do with reality. Still, they can help whistleblowers when they are told that something should have been kept secret.

Farther on in the interview Van Es is quoted as having said:

«If Dutch integrity policy is compared with that in other countries we score pretty well, we're in the top ten. Of course, in spite of this policy, incidents still occur, and may sometimes even be serious. That may be bad for image and trust, but can also be an indication of a culture where people are less afraid to report misconduct».⁷⁸

The incidents are not specified. Note that Van Es tries to shift the focus from something bad, the "incidents", to something good: an indication of a better culture.⁷⁹

Under the heading *Whistleblowing should be normal* she claims that real progress has been made with the "Whistleblower dossier". She shows no doubt about the new regulation (mentioned earlier). No remark is made about the unequal treatment of the two parties, and about the fact that the regulation assumes that the management is honorable.

She doesn't explain why her optimistic attitude should impress potential whistleblowers more than what she keeps silent about. Such as the facts that all whistleblowers fared badly, and that all responsible politicians and managers could keep their positions of power, and pursue their careers unhindered.

The article of Hans van den Heuvel and Leo Huberts⁸⁰ has the title *Management integrity today*. In their introduction they note that in the past 15 years much has been published about integrity questions. They continue as follows:

«In our opinion it is problematical that much [literature] has a normative character, recipe booklets and prescriptions for good conduct, sometimes based on common sense, sometimes on ideas of a philosophical-ethical school, and sometimes on individual feelings and insights.⁸¹ What is lacking is empirical research, and the formulation of theories based on empirical research».

They don't pretend that their article will change this. They only try to review the development of integrity policy, and to answer, with the help of surveys, the question how managers and civil servants think about integrity and integrity violations. They conclude:

⁷⁷ P. 23-4.

⁷⁸ P. 24.

⁷⁹ Which is supported by the illogical "Of course".

⁸⁰ Hans van den Heuvel and Leo Huberts are professors in the Research group Integrity of management of the department of Management sciences of the Free University of Amsterdam.

⁸¹ Sic: the original is no sentence either.

«Dutch public management scores well on integrity. There is a lot of attention to integrity; Dutch policy development leads the way, and the number of integrity violations- as far as visible- seems to remain within the bounds of what we find acceptable.⁸² But this doesn't mean that complacency is justified. The glass is half full, but also half empty, and work remains to be done, for a next phase. [...] The present government makes a beginning with the *Code for good public management*.⁸³ Openness, integrity, participation, decent contact with the citizen, effectiveness, efficiency, legitimacy, the capability of self cleaning and the willingness to account regularly, are important ingredients. On the other hand codes- soft law- should not distract attention from the need of hard law and its maintenance».⁸⁴

After having noted a lack of empirical research it surprises that these authors are not more cautious in their conclusions. What is the meaning of a soft code, and what is hidden behind "as far as visible"? Here nor anywhere else in the yearbooks it is noted that politicians and civil servants may have an interest in lying and cheating, and that they have the means and power to keep them hidden or cover it up. That this and only this can explain their disproportional reaction to whistleblowing, and the scarcity of whistleblowers.

The article of Mark Bovens and Gerolf Pikker⁸⁵ has the title *Whistleblower regulations: useful but insufficient*. «In the course of 2008 these regulations have been evaluated [...] at the request of the minister of Internal affairs.⁸⁶ [...] The central questions were:

1. Do the regulations contribute to internal reporting and discovery of misconduct?
2. Do the regulations offer adequate legal protection to whistleblowing civil servants?»⁸⁷

The evaluation is based on a survey. The conclusions are summarized as follows:

«The conclusions [...] are serious: the regulations stimulate internal reporting and discovery of misconduct only to a limited extent and hardly offer legal protection. For a part of the civil servants the lack of protection is an important reason not to report suspected misconduct. The interviews show that suspicions of "serious" misconduct (where the management is involved) are reported only by people who can afford negative consequences, or are willing to risk them».⁸⁸

The conclusion about the Commission Integrity Government (CIG) is remarkable:

«In recent years, the CIG, the external organization where people from government, police, the defense organization,⁸⁹ and the provincial governments can report suspected misconduct, has played no role of any significance. The commission is unknown, and isn't trusted. There are many barriers on the road to the commission. It doesn't operate as an inquiry commission, but as a commission for objection and appeal [a formal legal procedure]⁹⁰. Of the 43 reports which were submitted to it in 2002-2007, it admitted and dealt with only 10. In the period indicated the commission advised about 7 of them. In no case did the commission establish misconduct.»⁹¹

The introductory section of their article is entitled *Whistleblowers: well-known, but unbeloved*. They mention the names of some well-known whistleblowers, and observe:

«Civil servants and other employees who report misconduct without permission, like Spijkers, Schaap, Van Buitenen, or Bos have gradually become well-known Dutchmen. At the same time they

⁸² "we find acceptable". Who? How do the authors know? Could "we" do something about it? Or is everything acceptable as long as no politicians are shot and government buildings blown up? In fact, people cannot even ask for a referendum about matters like this.

⁸³ The code is in the directory Integrity, under 20090609.

⁸⁴ P. 37.

⁸⁵ Bovens is professor of management science at Utrecht University, and research director of the management and organization department of this university. Pikker is enterprise scientist, and senior advisor and researcher at the department aforementioned.

⁸⁶ Note that contracts with a ministry inevitably create a dependency.

⁸⁷ Pp. 38 and 40.

⁸⁸ P. 42, end of section 3.

⁸⁹ Denoting army, navy, and air force.

⁹⁰ As always, [text in black] is by JFCvV.

⁹¹ P. 41. Note that this is noted by scientists, not by parliament or the DGAO (efficiency...).

are tragical figures: they are well-known mainly due to the dire straits they landed in».⁹²

Bovens and Pikker do not note that it is very improbable that politicians or managers will permit publication of reports of misconduct for which they are responsible. Neither do they answer the question what these dire straits imply about the integrity of the responsible politicians and managers.

The chapters 8-11 strongly support the remark by Van den Heuvel and Huberts, quoted earlier, «that much [literature] has a normative character, recipe booklets and prescriptions for good conduct», and that «what is lacking is empirical research, and the formulation of theories based on empirical research». The introduction of the Yearbook 2010 summarizes these chapters as follows.

«In chapter 8 Paul van Tongeren and Marcel Becker, two philosophers [...], discuss virtue ethics as an alternative approach for connecting integrity with rules and codes. As the four cardinal virtues they mention courage, measure, justice, and good sense. The honorable civil servant or manager is the one who knows how to do his duty courageous, just, sensibly, and without excess. The virtuous civil servant isn't virtuous because he works dutifully, but because he tries to do it better.

In chapter 9 the ideal integrity officer is presented as a rebel with cardinal virtues. The first integrity officers are retiring. A good reason to put them through their paces one last time, and to ask them what wise lessons they have for integrity officers of today. The question is answered by Jur Teders, who was head of the department Integrity of the ministry of transport and waterworks from 2004-2007, Alex Belling, who was coordinator of integrity policy for public administration at the ministry of internal affairs from 2002-2008, and John Dirks, who held the portfolio integrity of the police corps of mid and west Brabant from 2003-2009.

Their answers are not worth a quote or summary.⁹³

According to Edgar Karssing and Sacha Spoor the Netherlands needs a third generation integrity policy. In chapter 10 they assert that integrity 3.0 means careful, explainable and steadfast behavior. Integrity is connected to the quality and effectiveness of work. It isn't a hygiene factor any more. In policy priority is given to managing on the basis of trust, to offering a framework, and to accounting for work done, to professional pride and to organization-learning.

In chapter 11 Tica Peeman criticizes the Taylor bureaucracy, and discusses the characteristics of high trust organizations. As common denominator high trust organizations give employees full trust. According to Peeman, the important and beautiful job for the managers in public administration in the coming years will be: be an example, spread the culture and vision on integrity, and be transparent in that».⁹⁴

The concept of “high trust” enjoyed great popularity among the managers of the ministry of education around 2010. It should be the basis for the relation between ministry and its agency NEA. In that case it seems to be primarily meant to suggest that the past should be buried and forgotten, and to avoid serious evaluation.⁹⁵ This attitude guarantees repetition of errors and failures, and is incompatible with the code for good public management, which prescribes learning and self cleaning.⁹⁶

The yearbook ends with some “good practices”. They breathe a cheerful and optimistic spirit. They may be useful. But the reports are based on interviews, and the words need not be related to the facts.

⁹² P. 38.

⁹³ Their functions show that these are establishment people, approved by the suspects. Which is confirmed by what they say. An example. On p. 68 Teders asserts that when he became head of the Integrity department he introduced three motto's: integrity is normal, integrity is fun, and integrity is rewarded.

⁹⁴ Yearbook 2010, p. 15.

⁹⁵ Karssing and Spoor please note: no accounting, no learning.

⁹⁶ The code for good public administration can be found in the dossier for this chapter. It is named: “20090609_Code voor goed openbaar bestuur_BZK.pdf”.

The practices seem to contain a high percentage of wishful thinking. The authors seem to know nothing about the internal operation of public administration. They seem to know nothing about the true character of the managers.⁹⁷ The effect of the instruments mentioned can easily be “neutralized” by contrary “exemplary” behavior of managers.⁹⁸ Undoubtedly even the ministry of education could furnish good practices. Just ask the SG to mention a suitable spokesperson or other contact.

The yearbook 2011, and the role of the DGAO.

This yearbook was edited by Suzanne Verheij and Edgar Karssing.⁹⁹ In their introduction on p. 6 they write:

«Like last year we chose a format with interviews and contributions from science and practice. By interviews of prominent people we try to map the field in its full width. The other chapters probe its depth. Where we tried to find a balance between theoretical exploration of central concepts and instructions for the implementation of integrity policy».

But for theoretical exploration and instructions for implementation of policy to be effective you should know and understand reality. And as said before: the reality behind the whistleblowers and financial crises is at most touched upon. If you want to address the true problems of integrity, these yearbooks are almost useless. Someone who really wants progress would compose very different yearbooks.

About the interview with Saskia Stuiveling,¹⁰⁰ president of the Dutch General Accounting Office (DGAO), the editors say the following:

«The DGAO is an important guardian of the integrity of the Dutch government, because it examines the effectiveness of government policy.¹⁰¹ Integrity is also important for the DGAO as an organization. The president claims that her organization is honorable: employees are required to think in advance of the rules».

These are big words. It is impossible¹⁰² to reconcile them with the reports of the DGAO.

On 25/3/10 the DGAO published a report *State of affairs integrity care government 2009*.¹⁰³ On p. 13 of her interview with Ronald Jeurissen and Sacha Spoor¹⁰⁴ in the yearbook, Stuiveling says the following about this report: «**The recent inquiry of the DGAO into the integrity care policy in the government shows that work remains to be done**». Which is true, but not concluded clearly and prominently in the report. In fact, the report is full of ambiguous diplomatic assertions. On the one hand it suggests that the report is restricted to systems of integrity care, and does not consider integrity as such. On the other hand it tries to respond to the lack of confidence in the integrity of managers of many people who took part in the survey:

«More than half of the people interviewed indicate that exemplary behavior and ethical leadership of the management are invisible, or even have a negative opinion about these aspects».¹⁰⁵

The DGAO shows no surprise. It asks no questions about the cause of the negative opinion, and doesn't consider the possibility that it has good reasons. Even though most instruments for integrity care assume integrity of the management, and the system requires the management to act as examples

⁹⁷ As opposed to the image they try to broadcast of themselves, as shown above for the SG and uSG of the Dutch ministry of education.

⁹⁸ Even by a single exemplary instruction. Let alone promotion or sidetracking.

⁹⁹ Suzanne Verheij worked at OPIPA, Edgar Karssing at Nyenrode Business University.

¹⁰⁰ An ex-politician, ex-member of government.

¹⁰¹ The “because” is logically incorrect.

¹⁰² “Hard to reconcile” would be expressing the state of affairs too weakly.

¹⁰³ The report can be found in the directory Integrity, under 20100325.

¹⁰⁴ Ronald Jeurissen is professor of corporate ethics at Nyenrode Business University and director of the European Institute for Business Ethics (EIBE) of this university. Drs. Sacha Spoor is senior advisor and trainer at the EIBE.

¹⁰⁵ P. 11 of the DGAO report.

in relation to the “soft controls”.¹⁰⁶

The first conclusion of the report is:

«Since 2004 nine ministries have strengthened their system of integrity care. In the last four years, four of the thirteen ministries have made little progress in the implementation of the system of integrity care».¹⁰⁷

In other words: it has remained the same or has become better. And although a change from “very bad” to “bad” is an improvement, the reader is probably expected to think that it went from good to better.

A system of integrity care is no goal in itself. It is a means to accomplish another goal, the integrity of the government (or public administration). The DGAO says that it considers the integrity of government very important. It observes that a majority of the government employees doesn't have a positive opinion about the integrity of their managers. How then can the DGAO ignore the question whether it may be assumed that the given systems of integrity care ensure adequate prevention and self-correction? It even allows itself to be seduced to false pretensions by suggesting that it can hardly be done better:

«We have ascertained that the ministries, and the agencies and other organizations involved in this inquiry, in general have a rather complete set of regulations for integrity».

One wonders what can be meant by “in general” and “rather complete”. Does completeness mean that there is a reliable (independent?!) procedure for establishing that a manager violated the code of conduct? That adequate measures are taken after this has been established? (Of course not). If “complete” would mean that the system works, there should be a significant difference between the answers given by employees in organizations where the system is complete, and those given by employees where it isn't. This is not the case. The studies in the present report clearly show that it is ridiculous to suggest that there is an effective system of integrity care. The system is fatally incomplete. It doesn't work properly at all. The conclusions of the DGAO cannot be correct. They are misleading, a sop.

P. 30 of the DGAO report shows a table with an overview of the state of integrity care in the different ministries. The table gives a qualification for each of 11 instruments, for the years 2004 and 2009. For 2009, the ministry of education gets 10 pluses, and one symbol for “partly provided for”. The last is given for the indicator “Risk analysis”. From the reports in the preceding chapters it follows that an organization with a management that violates integrity as a matter of course can have a system of integrity care that is qualified as good by the DGAO. So the indicators say absolutely nothing about the integrity of the organization. One may nevertheless ask oneself how an inquiry into systems of integrity care can give such a positive picture. The answer has at least four components:

1. What DGAO calls a good system of integrity care doesn't say anything about integrity in practical reality (this was shown above);
2. The set of instruments is clearly inadequate. Many instruments are useless as indicators for the quality of a system of integrity care, and all instruments assume integrity of at least the management (for example: code of conduct, policy evaluation, audits);
3. Integrity and having a good system of integrity (as defined by the DGAO) are two different things;
4. The three methods used by the DGAO:
 - a. «We have made an inventory of the system of integrity care and compared the situation in 2009 with that of 2004;
 - b. We conducted a perception inquiry by an internet survey of randomly selected civil servants of the same organizations;
 - c. We analyzed the integrity reports, integrity violations and punishments».¹⁰⁸

¹⁰⁶ What is called soft controls has more to do with soft than with control. P. 7 of the DGAO report gives a definition by examples: training for dealing with dilemma's, conferences about subjects related to integrity, and exemplary behavior of the management. Probably the brochures and yearbooks of OPIPA have to be counted as soft controls as well.

¹⁰⁷ P. 9.

¹⁰⁸ P. 25 of the report.

The comparison of point a is no more than that. Its relevance depends on the quality of the reference system. That is, on the quality of the system the DGAO calls “good”. As shown, what the DGAO calls good is utterly inadequate.

The survey of point b is only relevant if the people who answer the questions know and understand what is happening in their organization,¹⁰⁹ and if they are competent and honorable.

The inquiry of point c assumes integrity, which the system of integrity care is to ensure, and therefore may not be assumed.

A good researcher is a critical researcher. He asks himself whether his conclusions are consistent, plausible, and could be correct. In case of doubt he checks, tries to explain etcetera. In the DGAO inquiry the results of the survey are incompatible with the hypothesis of good systems of integrity care. But the report doesn't try to explain the discrepancy, as good researchers should. The discrepancy is explained above: integrity and a good system of integrity (as defined by the DGAO) are different things. What DGAO calls good isn't. The report should have stressed the difference. Furthermore the result about the systems of integrity care is implausible. Only the survey results are compatible with for example the daily news and the whistleblower cases. (The most important cases had not been solved in the period studied).¹¹⁰ The DGAO and its report seem to have solved the implausibility by not looking beyond the system of integrity care. That is: by not thinking and not asking plausibility and other critical questions.

The DGAO is part of the government, and just like the ministries gives an incorrect and misleading picture of itself:

«In my opinion [= that of Stuiveling] it is important that all employees of our organization reflect on integrity and address one another about the integrity of their conduct. When something goes wrong in another organization, it is good to understand that something like that can happen in our organization too. We introduced a new code of conduct. In work conferences we often discuss integrity questions. At the end of last year we organized an “integrity afternoon” to discuss dilemma's we encounter in our work. Talking with one another gives the subject its own dynamics. Knowing that colleagues have similar problems, and that these problems are part of the job makes it easier to deal with them. It isn't a problem with you personally, but a problem of the job. That gives relief, for otherwise people could get into personal difficulties. By talking about it an employee feels himself supported by his colleagues and his organization».¹¹¹

Stuiveling seems to suggest that the DGAO does all that is needed to ensure integrity. But it doesn't, as shown by the report on systems of integrity care. If the report of the inquiry doesn't mislead intentionally, then the pretension of the DGAO to be able to conduct such an inquiry is false. Both are incompatible with integrity.

It is a pity that Stuiveling isn't more specific about the dilemma's, and doesn't give examples. Does she mean that she needs the cooperation of the ministries, and that she fears the consequences of less restrained (more open and truthful) analyses and reports? If the dilemma's are related to the work, why can't they be discussed openly? Could she mean that a compromise has to be found between integrity and effectiveness, or staying in business?

Both OPIPA and DGAO suffer from selective observation. They stake claims in the field of integrity, but neglect to properly analyze whistleblower cases, and ignore the crucial study of Van der Vliet et al. Both lack openness. OPIPA publicizes yearbooks with interviews and articles. But the authors and the people who are interviewed are selected by government officers, and there is no opportunity to react on either interviews or articles.

Both OPIPA and DGAO seem to have resigned themselves to working in the margin.

¹⁰⁹ For about 20 (twenty) years, the present author didn't know or understand. He didn't believe in the integrity of the management, but that is quite different form being able to prove it.

¹¹⁰ According to p. 30 of the report, both the ministry of defense (Spijkers) and that of building (Bos, see chapter 8) had a code of conduct already in 2004.

Chapter 5.

Chronicle of a policy claim/ IAG2010!/Renewal program.

Table of contents of this chapter.

1. Summary and conclusions.

2. Introduction.

3. Chronicle.

 1998-2004.

 2005.

 2006.

 2007.

 2008.

 2009.

 2010.

5.1. Summary and conclusions.

1. In 2005, the Information Administration Agency (IAG) of the Ministry of Education had 1400 employees (fte) at a cost of 70 M€. It had a budget of 30 M€ for external personnel.
2. The budget for the Renewal program was 55 M€.
3. The Renewal program is an example of false pretensions, and of efforts to keep them up with incomplete and incorrect reporting.
4. The program provides numerous examples of evaluations by consultancy or accountancy firms which seriously underestimate shortcomings and problems. The firms facilitated continuation of the shortcomings and problems, and hampered successful completion of the program.
5. The program is an example of failure to learn from experience (and professional literature). It is an example of history repeating itself (unnecessarily). The chronicle explains this. In sum: by absence of control and accountability. There simply is no need of improvement.
6. The Renewal program was preceded by a similar project Redesign. This project was a complete failure. In a letter to parliament of 2000, minister Loek Hermans of the education ministry asserted that the failure had shown that organizational improvements were necessary and had been started. In the following years nobody checked whether the necessary improvements were realized.
7. In 2005 IAG asked or claimed a relatively large amount of money without asking itself whether it could spend that money effectively and efficiently. It actually didn't know what to do with it. It took a lot of time to formulate something resembling a plan. Next it couldn't manage the implementation of the plan. It overestimated its abilities, and/or put its doubts aside to gather in 55 M€.
8. Before starting with something like the Renewal program, ministry and agency should have asked themselves whether the lessons of the failure of the project Redesign had been learnt. Before promising the claimed money, the ministry should have checked whether the necessary improvements had been realized. Nothing like this was done. As long as these questions had not been answered convincingly in the affirmative, neither party should have continued.
9. The chronicle shows no sign of memory or learning. The same errors are made over and over.

10. Because of the similarities of Renewal and Redesign and the lack of signs of improvement, failure was highly probable. The management of the ministry was warned with sound argumentation. The warning was ignored without argumentation.
11. None of the supervisory organizations (DGAO and the audit department) and consultancy/accountancy firms (KPMG, Cap Gemini, PwC) has asked or checked whether the promised and necessary improvements had been completed. None of them noted that this was a condition for success. The consultancy/accountancy firms nevertheless made remarks that should have raised doubts. But they were not openly critical, and did not recommend anything sufficiently radical.
12. The reports of PwC of autumn 2007 could and should have woken the ministry (uSG) from its dream. In spite of obscurities and inconsistencies they clearly showed that IAG lacked essential capabilities, and had not sufficiently learnt the lessons of Redesign. Basic assumptions and conditions were not satisfied. In pursuance of these reports, the ministry should and could have asked for rescheduling and/or reduction of goals.
13. The absence of replies to a mail with the warning of 2005 and the reports of PwC witness one and the same attitude in the management of the ministry: that of rejection of everything that doesn't fit "positive thinking".
14. Action was only taken in 2009, after the program had come to a standstill as a consequence of internal problems.
15. In the decade preceding the standstill many reports of inquiries, audits etcetera have been published about IAG and the Renewal program. But although several of them called attention to risky weaknesses, none of them concluded that IAG pretended too much.
16. Without exception the reports paint a picture of the capabilities of IAG that is too rosy. Risks are systematically underestimated or ignored. The picture is based on research that is methodologically inadequate.
17. Some reports contain inconsistencies. Analysis of the text suggest that the picture was "improved" under pressure of the commissioner. If this isn't done consequently inconsistencies are created.¹
18. The reports do not define the object of investigation clearly. They do not indicate what type of conclusions can and cannot be drawn.
19. Professional norms, including those defining integrity, were violated systematically.
20. An important methodological error that is made in many inquiries is the uncritical use of interviews as a source of information.² If an organization or project is object of investigation, those involved (or responsible) are objects of investigation, but not necessarily reliable sources of relevant information. This chronicle and the preceding chapters give numerous examples of incorrect and misleading information given by participants.

¹ Here (and possibly elsewhere), "consequently" is used to mean: equally or similarly in similar situations, or under similar conditions.

² This may be presented as an explanation, but as an explanation it is erroneous, and it is not an excuse anyway. Interviews would only be efficient if they were reliable. But they are only reliable under condition of both integrity and ability. Which in general is to be proven.

21. By inquiries of insufficient quality, and by defective presentation of results, consultancy/ accountancy firms and audit organizations share the responsibility for undue delay of corrective measures. They cause waste of taxpayers' money.³
22. With regard to the Renewal program, the attitude of the ministry with respect to IAG was irresponsible. The attitude of the ministry was ambiguous and misleading. By asking information from IAG it created the impression that it felt responsible. (Which it was). But for years it didn't do anything with the information. When asked to do so by IAG, it refused to think about a reduction of the portfolio for system development, or alternatives. The ministry didn't manage responsibly.
23. Quite generally the way of working cannot acceptably be accounted for.
24. Important argumentation is made unreliable by obscure language and false pretensions. All actors appearing in the chronicle show an exaggerated opinion of their own capabilities and that of their section/ department/ organization. (Or a lack of modesty and doubt). The risks that this creates are increased by eliminating people who are open and critical.
25. With minor changes, what has been said about the Renewal program as remake of the project Redesign holds just as well for the project System Renewal Study Financing as a remake of the Renewal program.
26. Ministry and IAG behave like swindlers: they defraud the taxpayer on false pretexts.
27. The chronicle shows that participants of a project are selected in such a way as to maximize the risk of failure. People who are open and critical are ignored, and people who equate critical with negative, and only say what they expect to be desired and approved by their superiors, are chosen as participants or promoted.
28. The hypothesis that the top management is honorable and competent and does its best, and that things go wrong due to unforeseeable difficulties, is shown to be incorrect. The top is neither honorable nor competent. It doesn't want to be reminded of past failures: it wants to look only forward. Critical remarks are not evaluated on their merits. They are treated as signals of obstruction and lack of willingness to cooperate. Warnings are given, and suggestions for correction made. But the top imagines to know everything better, is unwilling and unable to discuss matters openly and to acknowledge mistakes. And last but not least it knows that it has the power (and political support) to avoid having to account for its actions.

The Advisory group.

For the Renewal program, uSG was supported by an Advisory group. Both uSG and Advisory group behaved irresponsibly. As if they only had to supply money, and money grows on trees. They acted as if it were permissible to approve things you don't understand, and- according to the chairman of the group- were not even willing to try and understand.⁴ The questions the Advisory group asked IAG nevertheless show that it sometimes felt uneasy about its role. But it didn't do anything about it. The Advisory group and uSG ignored that the opinion, that the ministry is responsible only for financing, is untenable for both political and logical reasons. The group did nothing that could have given uSG better control of the process. For example by asking IAG to make the plan understandable, and to supplement it with well defined milestones (intermediate results), spaced more or less evenly in time. This facilitates objective monitoring of progress. But probably this is asking the impossible. The Advisory group had approved the renewal plan on the basis of documents which suggested that IAG

³ Doubly, in the sense: what is spent on them is wasted, and they cause unnecessary waste in the project or program they are supposed to evaluate.

⁴ He said so in a meeting at the end of 2009, reported in the chronicle.

didn't know what it wanted, and couldn't get its thoughts properly organized. Such a group cannot be expected to ask for an understandable plan and verifiable milestones. Questions like that correspond to management that isn't based on blind trust or absence of responsibility. It corresponds to management that feels responsible and accountable, and tries to ascertain that the people working on the project have the necessary capabilities. Responsible management monitors progress and corrects when necessary.

The Advisory group failed in more respects. It ignored previous experiences and lessons, and never wondered whether IAG could properly manage and execute an exceptionally large program like the Renewal program. It didn't warn of the risk that the fusion of IAG and IFC would seriously reduce the chances of success of the Renewal program. It was clear that the fusion would claim time and energy of everyone in IAG (and IFC), and require rescheduling of the Renewal program. But instead of proposing or aid rescheduling, the ministry (initially) opposed it. The Advisory group and uSG were simply part of the problem.

Advice can be useless.

Most reports assume that it is sufficient to say what has to be done. They do so without having found or looked for changeable causes of errors or failure. Neither do they ask themselves whether it is realistic to assume that the persons addressed by the recommendations can do what they are asked to do. They don't ask themselves whether implementation of the recommendations eliminates the causes of the problems. In other words: most reports assume blindly that their recommendations can be implemented, and that implementation solves the problems. In general this is a mistake. All problems discussed in this book could have been avoided by applying available knowledge (and recommendations). If people ignored relevant available knowledge in the past, why not now and in the future? And indeed, many histories repeat themselves.

Often it is furthermore assumed that those concerned can and will learn. (As from now...). Without investigating the question why they didn't learn from previous experience and apply available knowledge earlier. Moreover, not everybody is willing and able to learn whatever may be needed for a given job.

Similarly it is often assumed that a given team, group or organization can and will learn, without checking for evidence showing that they do (not in words but in deeds). As noted earlier, in the given situation only the contrary is plausible or self-evident. It should be explained why it is reasonable to assume that as from now the necessary changes will be made, and the same (or other) people will behave differently.

In sum: advisors should not only say what is to be done, but also evaluate whether the given or designated people can and will do what is recommended and needed.⁵

Communication problems.

Several reports speak of outdated systems. But what does that mean, "outdated"? Does it mean that a job cannot be done properly (any more?)?⁶ Or only that it can be done more efficiently with a more modern system? Anyway, nobody explains, and one cannot exclude the possibility that people just mimic one another, or don't know or mean what they say but something different. As regards the Renewal program they might mean to say that the system as a whole has grown to be unmanageable due to a long series of adaptations/ accretions. If so, this has little or nothing to do with "outdated". Even a system composed of up-to-date elements can be unmanageable. Moreover, for an evaluation directed at improvement it may be quite important to denote and describe the situation correctly. How can one expect improvement without understanding?

A big problem in the relations of the ministry with its agencies is the fact that the top of the

⁵ This may sound simple and self-evident, but I know of no report doing this.

⁶ A well known example of 2014 is Windows XP. Microsoft ended support in April. A large majority of newspapers and computer journals spoke of Windows XP as being outdated. In general without explanation. Lack of support and the introduction of incompatible new hard and software might pose problems in the future. But apart from that Windows XP worked and works without any problem whatsoever.

agencies is incapable to explain and describe their systems, the nature of the problems with these systems, and how they want to deal with them. This problem affects both temporary and structural activities. It may have two major causes:

- Lack of abilities of the management, both with regard to communication and understanding of their hard and software systems;
- Lack of understanding of the systems as a whole by anybody in the agency.

If true, this would imply that nobody in the agencies can properly analyze the systems and problems, and formulate meaningful plans for improvement. These observations are compatible with everything told in the chronicle (and with the other chapters of the present report).

The communication problems between ministry and agencies preclude adequate supervision of the agencies by the ministry. But the ministry didn't seem to be aware of the problem. Possibly in combination with blind faith in high trust management it tolerated a culture of inadequate explanation and accounting. Studylink and all other projects show that this offers opportunities for abuse, and that both IAG and IFC used these opportunities.

5.2. Introduction.

This chapter describes the history of the most substantial program of the Information Administration Group (IAG) in the first decade of the 21st century. The ministry of education made 55 M€ available for the project. This amount may be compared with the yearly budget of IAG in 2004, the year before the project started: 110 M€. The project lasted from 2005-2009. The author participated marginally in the initial and final phase of the program. The chapter was begun out of curiosity about the intermediate period. The author knew almost nothing about it. The inquiry turned out to be much more instructive than expected. Mainly because in the intermediate period, IAG and the program were evaluated by quite a few external organizations. Their reports make fascinating reading. They can be studied from several points of view. They can be studied as autonomous reports, without regard to the context: for clarity, method, argumentation and consistency. They can also be evaluated in the light of the known outcome of the project. And one can study the management reactions on the reports.⁷

The chapter is mainly concerned with the behavior of the ministry as manager of IAG and commissioner of the project, and with the information that IAG and others provided about IAG and the project. Summary, conclusions and some analysis are given above, in section 5.1. The remainder of the chapter consist of a description of the history of the project and the events immediately following its crash.

5.3. Chronicle.

1998-2004.

The GAO on IAG.

The Renewal program was preceded by a similar program: the project Redesign.⁸ The project Redesign ran aground. The Dutch General Accounting Office (GAO) made an inquiry of the course of the project. The conclusions are given in its report about the financial accounting 1999 of the

⁷ And last but not least they are public, and can serve to instruct every citizen.

⁸ In this chapter, the words program, project and plan are not always used in accordance with their definitions. Where the author felt free in the choice of terminology, the word program denotes a set of projects, and the words project and plan denote what they denote in common parlance. With regard to the Renewal program the terminology is in accordance with the definitions, except in the quotes, where the terminology of the source has been retained. Redesign is often called a project because everyone did so. Even though it was a program. In the present context the distinction is quite relevant, because the coherence of projects, or the absence of coherence, is of great practical importance. Absence of coherence is important because it may imply freedom to cancel one or more projects of the program, or to change the order or time frames in which the various projects are executed.

education ministry, dated 30/5/2000.⁹

«IAG has a Redesign program which consists of three large programs for change: the introduction of integrated customer service, a general reorganization, and a new system for study financing. The first two are almost completed. The third doesn't proceed according to plan. The estimated costs rose from 130 Mf in 1997 to 227 Mf in February 2000.¹⁰ Of the automated systems that should support the new approach, only the “shell”, an application for data retrieval, was available at the end of 1999. The phase difference between organization and application development causes risks for the management of IAG. These risks are amplified by the call that is made on the capacity available for system development.¹¹ The coming years there will be an accumulation of requests for system changes due to many new policy measures. [...]»

The audit department (AD) [of the ministry] investigated the IT management of IAG in 1999 and concluded that the quality of the IT production is adequate, and that the awareness of the need for good management had increased. However, according to the AD the IT management as a whole was insufficient, because the information security policy had not been updated in 1999, and because the fall back possibilities [...] had been organized insufficiently. The AD also made remarks about the management of problems and changes, and about system maintenance. The weight of these remarks has increased greatly due to the decision to temporize the Redesign program and to extend the operational lifetime of existing systems. The DGAO endorses the conclusions of the AD, and has the opinion that there are shortcomings in the organization of the automation by the IAG».¹²

Note that the first paragraph doesn't mention or explain the temporization mentioned in the second paragraph. The DGAO furthermore gives no clear indications about the importance of the shortcomings and problems. It says nothing about the need of external intervention. It implicitly suggests that the risks and shortcomings can be managed by IAG itself. But the fact that it does not say so explicitly gives rise to doubts: don't the shortcomings threaten effectiveness and efficiency, can IAG adequately manage the risks and shortcomings autonomously, or is intervention necessary?

Hermans' letter to parliament about the failure and follow-up of the program Redesign.

The next milestone is the letter of minister of education Loek Hermans to parliament of 20/12/00 about the conclusion of the Redesign program and an evaluation of the IAG.¹³

The first two quotes are from section 1 of the letter, “Change of course IAG”. The first is from p. 2:

«On the basis of the results of this study [by IAG] it was decided to innovate by stepwise renewal. This means that it must be decided which systems are to be renewed first, whether necessary changes can be implemented most efficiently in existing systems, or that building a new system is a better option. Experience has shown that the alternative, simultaneous replacement of all existing systems by an integral new system is not feasible. Maximal use will be made of experience and results obtained. It has moreover been decided not to organize the stepwise renewal as a separate project, but as an integral part of the line organization. The line managers will be responsible for progress, which increases the involvement of the employees in the renewal process».

The second quote is from p. 3:

«The big difference with the old approach is that the renewal of the system software will not take place in a separate unit of the organization, but will be considered as part of daily routine. The necessity of system renewal remains, but will be phased and temporized with emphasis on manageability of the renewal process. Priority will be given to process improvement. Solution of practical problems of the shop floor takes precedence, so that employees of IAG experience the advantages of system renewal directly».¹⁴

⁹ The report is in the directory Renewal, under 20000530.

¹⁰ 1 € = 2.2 f (= "gulden").

¹¹ This probably refers to system development required by changes in laws or policy.

¹² Pp. 15-6.

¹³ The letter can be found in the directory Renewal, under 20001220.

¹⁴ This may be, or probably is, the origin of the earmarked budget of 2.3 M€ for stepwise process renewal. A proof could not be found, but this is how things were done at this ministry.

Section 2 discusses the results of the program and summarizes the financial consequences:

«Of the total amount of investments, 70 Mf has produced useful results, 27 Mf is useful for the continuation of system renewal, and 59 Mf has to be written off.

[...]

In terms of time and money and due to its R&D character the approach chosen by IAG was no longer manageable, but in terms of technological innovation very promising».¹⁵

The following is quoted from the beginning of section 3, “Results benchmarking”:

«In order to find out whether the monopoly position of IAG doesn’t lead to inefficient use of [financial] means, I requested KPMG to benchmark IAG. [...] Within the set of benchmark partners IAG scores average, so sufficient. I conclude that the image of a malfunctioning organization that may have arisen is falsified by this inquiry. IAG scores good where costs are concerned. It may be concluded that IAG works efficiently».

This is being said after having concluded that Redesign had to be abandoned, and that 59 Mf of taxpayers’ money has to be written off.

Hermans is silent about the limited significance of the benchmark. Without hesitation he draws important conclusions on a very weak basis. There is no uncertainty or prudence.

The section about the benchmark ends as follows:

«IAG agrees with the conclusions and recommendations of the benchmark. In some fields action has already been taken. The coming years will show whether these actions have produced visible results».

Section 4, “Formal position of IAG”, considers the legal status of IAG, and the management of IAG by the ministry. The minister concludes:

«I think the ideal would be that in the short term IAG and I make a system of agreements which on the one hand defines the products and services of IAG, and the budget I will make available on the other. The concrete proposals for improvement are:

[...]

- the position of the Supervisory council of the IAG has been clarified. In its supervisory work, the council keeps the political situation in mind. In my periodic conferences [with the council] the supervision of the top of IAG by the council will be discussed. In this way the council accounts for the way it has been supervising».

The annual reports of IAG include a report of the activities of the Supervisory council. It shows that the members of this council (can) spend only a small part of their time on the supervision of IAG. The council meets 4 times a year with the top of IAG, and 2 times with the minister. It is therefore impossible that its supervision is substantial.

It is remarkable that the letter notes that processes of improvement are necessary and have started, but says nothing about the monitoring of these processes. Neither by minister or ministry, nor by the Supervisory council. On the contrary, he will wait and see: “The coming years will show whether these actions have produced visible results”.

Hermans’ letter is defensive and denying. It doesn’t refer to the remarks of DGAO or AD. Let alone that the problems they mention are discussed and dealt with. Parliament (at least: a majority of parliament) nevertheless accepted the letter. No corrective effect could be observed.¹⁶

Who is who in the top.

In the year 2000, Hermans appointed the head of the IAG, Harm Bruins Slot, SG of his ministry. Bruins Slot had been head of IAG since 1998. Hermans was minister from 1998-2002. As head of IAG Bruins Slot was succeeded in 2001 by Chris Spanjaard.¹⁷ As SG Bruins Slot was succeeded in

¹⁵ R&D= research and development.

¹⁶ This is the reason why no effort was made to find the minutes of the relevant meeting of parliament.

¹⁷ P. 8/6 IAG annual report 2001. In the directory renewal, under 20020426.

2003 by Koos van der Steenhoven. Hermans was succeeded in 2002 by Maria van der Hoeven, who remained minister of education until 2007.

The February 2003 benchmark.

In February 2003 another benchmark report was published.¹⁸ The following gives an impression of that report. It is discussed because it may have influenced decision making about the policy claim (the first name of the Renewal program), and because the study of reports of this kind is one of the main subjects of this chapter.

On p. 14 the report answers the question: "Where does the organization come from?":

«History

Since January 1, 1994 IAG [...] is accountable to a Supervisory council. In the last years of the 90's the IAG was radically reorganized by a redesign project. This project has been very taxing, but also brought important progress. The most important benefit of the project was that it transformed a product oriented organization into a customer oriented organization. [...]

In the past period almost the whole executive board was renewed. This causes a fresh wind and clear direction. One of the spearheads in the past period was optimizing processes and the planning and control cycle».

On p. 5 the report concludes:

«In the benchmark of 10 organizations IAG scores around or above average for most of the subject areas. An exception is the rating of IAG by the public, which is below average».

The report concludes as follows:

«Overall consideration

With respect to the benchmark of 2000 IAG made a step forward. Some results have improved. Direction has improved too, and a big step was made in the management of processes. However, if the improvement actions had started sooner after the benchmark report of 2000 even better results might have been obtained. Regarding employees IAG made a small step backwards. This refers to the application of instruments of human resources policy. Some essential points did get attention, so that employee satisfaction increased and absence due to illness decreased».¹⁹

Again a comparative analysis. The question whether the improvements are sufficient isn't even considered.²⁰ Can IAG properly do what it is supposed to do, and what it wants to do in the near future? Can the (generalized) conclusions of the report be drawn on the basis of benchmarking alone? Last but not least: benchmarking isn't benchmarking. In this case there is plenty of reason to doubt its relevance and usefulness. According to the report, the benchmark is based on a study of documents such as policy plans, year plans,²¹ and interviews.²² It was mainly aimed at measuring valuations of performance with respect to:

«goals and spearheads (ambitions) of the Policy plan (version 2002-2004 and draft 2003-2006).

The six ambitions presented there are:

1. pupils and students are significantly more satisfied with IAG;
2. IAG is appreciated as a partner in the education sector;
3. IAG is appreciated by the ministry;
4. Employees are significantly more satisfied than in 2000;
5. With respect to appreciation by the public, IAG wants to conform to the norms of the Charter for Public Accounting;

¹⁸ The report can be found in the directory Renewal, under 20030200.

¹⁹ P. 55. Note that the last sentence reeks of compromise, and of being added to end on a positive note.

²⁰ The answer might be that this question cannot be answered, and that one has to do with benchmarking. This answer can be rejected on the basis of the evidence presented in the preceding and following chapters: nonsense can never be accepted, or approved as being comparatively meaningful.

²¹ As the previous chapters showed, the relation between paper and reality may be absent. Although the benchmark report certainly isn't uncritical, formulations like those on p. 9 suggest that the documents were taken at face value. This may- but need not- have influenced the benchmarking, and should therefore have been discussed.

²² Pp. 9-10.

6. With respect to the INK model [a management model],²³ IAG wants to work effectively and efficiently, and this should become apparent in the realization of the performance contract [with the ministry].²⁴

Excepting 6, these are subjective social valuations. Ambition 6 depends on the quality of the performance contract, which is doubtful. For example because the management information of IAG is insufficient, as noted by the audit department. See below.

Another part of the explanation of the discrepancy between the benchmark results and reality can be found in the sections where the benchmark findings are discussed in more detail. They refer to the going concern. That is: to the standard processes. Which obviously is important, but insufficient for the generalizations of the “Overall consideration”. Furthermore, someone looking beyond the averages can easily find warnings in these sections. Such as: “Innovation and knowledge management can be organized better”. And a remark like “has improved” sometimes seems to be a half-truth hiding insufficiency (and is anyway ambiguous). For example the graph on p. 42 under the heading “Leadership qualities improved” shows that the leadership qualities leave much to be desired. One automatically wonders whether the remark about innovation and knowledge management should be taken to mean that it is actually organized inadequately (or not at all).

All this means that the report isn’t open and independent. The reader should at least read very carefully, and not only take note of what is said, but also of what isn’t said. The report suggest that “insufficient” has been systematically replaced by “can be improved”. This is not accepted social custom however. Imagine school reports being written in this style! Obviously, this kind of report is insufficient for management purposes. It should at least be clear about the consequences of the present state of affairs, and point out insufficiencies that should be dealt with.

In the meantime one can conclude that the report violates the international code of ethics for auditors in the public sector.²⁵ Note that this can be concluded on the basis of a study of only the report. That is: without confronting it with reality. When confronted with reality, the report will be seen to have crucial flaws. Which is incompatible with a positive appraisal of the benchmark, but compatible with the analysis given above.²⁶

Finally it should be noted that a defective benchmark report is harmful. It reduces the pressure to take measures which are necessary to avoid systematic waste and corruption.

How the 2.3 M€ per year for process renewal was spent.

Every year IAG was given 2.3 M€ for process renewal.²⁷ The following quotes indicate how this money was spent. First a quote from the performance contract of 2004.²⁸

«2. Process renewal

The following is an incomplete and tentative list of the most important spearheads for the year 2004 as regards process renewal. [...]

- Realizing efficiency improvement in the processes via the project WorkWiser;
- Implementation of the ICT function including a new project management method;
- Application of innovative technological support in the processes;
- Developing instruments for management development.».²⁹

To show that this short term ad hoc approach was no exception we quote from the corresponding section in the performance contract 2005.³⁰

²³ INK= Instituut Nederlandse Kwaliteit, Institute for Dutch Quality. See IAG AR 2001 p. 18/11.

²⁴ P. 4.

²⁵ The code can be found in the directory Integrity: “INTOSAI Code of Ethics_ISSAI 30.pdf”.

²⁶ Strictly (logically) speaking it is not necessarily incompatible, because “relatively good” only means that the others are relatively bad. They may be (very) insufficient.

²⁷ As noted in connection with the letter of Hermans, this budget may have been created at the end of the Redesign program, to enable stepwise renewal.

²⁸ The PC 2004 can be found in two files in the directory Renewal, under 20040823 (appendices) and 20040824.

²⁹ The quote is from p. 3 of appendix 7.

³⁰ Appendix 7 can be found in the directory Renewal, under 20050727. The definitive version of the PC 2005 came in parts, and late. According to the general part it was to be signed 20/4/05, but the signatures are missing.

«2. Process renewal.

Every year IAG receives 2.3 M€ for process renewal. This is in addition to the basic budget, and supplementary to the process renewal that can be realized with the basic budget. In other words: the total amount available for process renewal is greater than 2.3 M€.

In 2005 the 2.3 M€ will be used for qualitative improvement and a temporary increase of organization and information analysts. The following extra capacity will be employed for this:

- Services P&I:³¹ 1.1 M€ extra capacity (6.4 fte) to implement the process renewal agenda of Services P&I;
- KS/P&I:³² 0.3 M€ for schooling, coaching and on the job training of new internal employees as a consequence of autostrada and [for?] hiring external people for the new internal employees who are being schooled;
- 1 M€ for hiring additional organization and information analysts to increase the capacity of the line (forming pairs of internal and external analysts, to spread know how).³³

No further information is given about the process renewal agenda of Services P&I.

The word “autostrada” does not appear anywhere else in the performance contract.

The quotes clearly show that there is no (“strategic”) long term plan for system renewal or modernization.³⁴ They confirm the remark of KPMG that “innovation and knowledge management can be organized better”. But they also show that the remark is a terrible understatement, which gives an incorrect impression of the quality of the management of IAG. Note that KPMG could and should have known of the earmarked 2.3 M€, and could and should have noted the absence of any long term plans.

2005.

Introduction.

The work done by IAG was done at the request of, supervised, and in a certain sense paid, by the corresponding departments of the ministry of education. The “corresponding” means: work in the field of higher education was done in cooperation with the department of higher education and so on. The “in a certain sense” refers to the fact that the ministry is a hierarchical organization, and that the budgets of the departments are the result of a distribution made by minister and/or (u)SG. Of course after a lot of deliberation. Most of the work of IAG, accounting for about 85% of its budget, was related to study financing. Most of the remainder was for HE. There was also work for primary and secondary education (PE and SE respectively), but not much. For all practical purposes, IAG, like IFC, was the responsibility of uSG.

For the contacts with IAG the departments had a departmental representative. Together with the assistant of uSG for IAG they formed the “IAG team”. The team met periodically to discuss the state of affairs and proposals for the future. HE was represented by Van Velsen.³⁵

A discarded warning about an inadequate plan and the inability of IAG to execute it properly.

In the last months of 2005 IAG sent the ministry documents describing what it intended to do with the ca. 45 M€ the ministry planned to make available for the so called policy claim.^{36, 37} The

³¹ P&I= processes and information. The meaning of this and similar abbreviations is 100% irrelevant in the context of this study. You only need to know that it is the name of a unit in IAG as a hierarchical organization.

³² The abbreviation KS is not explained in the text, but may mean client service (in Dutch: klantenservice).

³³ P. 3 of appendix 7. Due to round off errors the amounts add up to 2.4 M€.

³⁴ In theory process renewal and system renewal may be different, but in practice they go together or coincide. Moreover, since the ministry agreed with the use as shown in the quotes, it is ridiculous to suppose that it would have opposed use for the implementation of any long term plan whatsoever.

³⁵ Already before 1998, but it is not known since when exactly.

³⁶ In 2010 the origin of the name “policy claim” could not be found any more. The “incidental” 45 M€ may have been promised to partly compensate for a structural cut of the budget. It was a standard practice to give back a

documents were discussed by the IAG team. After some rounds of comments on drafts, IAG finalized the text. Everybody approved the text, except Van Velsen. At the end of December he sent Alice van Gent, the assistant of uSG for IAG, a mail with the following:³⁸

«I still have serious doubts about the adequacy of the “Substantiation” [of the plan]. If IAG cannot produce something considerably better, failure like that of the project Redesign is to be expected. Much in the “Substantiation” may have been copied from old documents, and there is far too little discussion of difficulties/ problems/ challenges (!) and how to deal with them.

I'm not saying that there is nothing in the paper that is true and good. But I do think that it is badly structured as regards the description of the problems and the desired changes. It makes the impression of an incoherent collection of text fragments. Much is missing. For example in chapter 7, “Management and control”. It has only two sections: “Starting points” and “Program organization”. Earlier chapters suggest actions of different kinds. But in chapter 7 there is no description of the different kinds of work to be done, and no indication of the order in which it should be done. This may also be of interest for the way the project is financed. What I read elsewhere in the paper suggests that it should be very well possible to say more. I consider the lack of information ominous because I see it as a symptom of inadequate understanding of the organization by its own management, and of the inability to start a major renewal process.

I do see a hotchpotch of reasons for change, and nice starting points, but nothing that convinces me of the ability of IAG to structure and manage the project. What the paper says about the organization of the project is definitely not convincing. (Experience shows that this gap cannot be filled by an external firm. The organization should have enough capable people of itself).

Therefore I stand by my opinion, that we as ministry should not accept this paper as basic document, but that in the course of 2006 ministry and IAG should try and reach agreement about a new document.

Furthermore it would seem to be wise that the ministry hires an expert, for 1 day per week, who has experience with reorganizations of processes in organizations which provide automated services on the basis of large databases. To help the ministry with competent, independent and critical comment. To me this seems to be very efficient from the point of view of cost and benefits.

Of course, the above is supported by experiences like:

- The often wearisome planning and implementation of much smaller renewal processes, and the bad substantiation of their costs;
- The use of the structural 2.3 M€ for process renewal, which was inadequate anyway, but very much more in the light of the new policy claim.

As far as I know, there is no big success that counterbalances these weaknesses.

Contrary to what was said in the presentation, IAG did have regular means for structural updates or improvement. There was a budget for process renewal, and maintenance was supposed to be included in the budgets for the going concern of the policy departments. I have explicitly verified this several times in the past. Maybe I didn't get a full and correct answer, but that seems to be part of the problem.»

Van Velsen got no reaction whatsoever.

The Advisory group. The lack of information about progress.

To support uSG, Van Gent formed a Advisory Group. It was chaired by Hans Haring, financial co-worker of the department Study financing. Van Velsen thought the policy portal project entailed enough extra work and trouble, and didn't like to participate as the only “pessimist” in a group of outspoken optimists. He was not invited, and didn't try to become a member. Still, the project could

small part of budget cuts for special purposes. The reasons given in the documents are invented a posteriori, as a cover. There probably was a need for updating systems and the system of systems, but as the Redesign program had shown, that would be impossible without “updating” management and staff. Witness too the lack of long term plans and the systematic abuse of money intended for process renewal.

³⁷ According to a memorandum 20051219_Notitie bij presentatie beleidsclaim_(AvG).doc of Alice van Gent, The Expert Centre (TEC) helped IAG with the formulation of the claim. From 1997-2003, before he became SG, Koos van der Steenhoven had been director of TEC.

³⁸ The mail is dated 16/12/05.

have consequences for the work of IAG in the field of HE, and the costs of that work. He therefore asked to be kept informed about the progress of the project. This was promised, but not done. When he asked Van Gent in the periodic meetings with IAG he got incomprehensible answers, which nevertheless suggested that there was nothing positive to be told.

Most of the documents used for this chapter have been collected at the end of 2009. The most striking observations of the years 2006-2008 were, that the project seemed shrouded in mystery,³⁹ that it took very long for the plan to be ready and accepted, and that nobody ever told anything comprehensible about the results.⁴⁰

2006.

Policy claim approved.

In a letter dated 29/5/06 uSG wrote the head of IAG that she was happy to be able to tell him that a positive decision had been made about the policy claim.⁴¹

The memo *IAG policy claim 2006-2010.*

In spite of its title, the main subjects of the memorandum *IAG policy claim 2006-2010. Information need of the ministry of education* of 23/11/06 are the management of the program and the responsibilities of various people and bodies in and around the project.⁴² It mentions the following:

«Starting points

- IAG and only IAG is responsible for realization of the trajectory. This means that time, money and quality are primarily managed by IAG. Management by the ministry is restricted to the main lines and political risks;
- As supervisor the Supervisory council should monitor and accompany the program critically;
- Financial means will be made available on the basis of completed plans for the separate projects in the program. The plans have to be approved by uSG before payment will be made;
- Payment takes place in accordance with the budget schedule for 2006-2010 and takes account of the total budget made available by the ministry. The ministry considers the budget estimates as the maximum estimates. Windfalls on the spending side lead to downward correction of the corresponding estimates;
- The long term budget estimates will be corrected for the savings assumed to be generated by the project. IAG is responsible for the realization of these savings».

So the ministry gives IAG two bosses: the Supervisory council and itself.

The quote shows that the ministry considers itself responsible only for the payments, and not for the course of the project. The ministry doesn't say that it will check whether the Supervisory council does what it is asked to do. It even doesn't wonder whether the council is able and willing to do the job.⁴³ The ministry restricts itself to the main lines and political risks. But how does it estimate the political risks? There is a political risk if there is a possibility that a minister has to go to parliament to answer unpleasant questions about something he is responsible for. For example if the media report that students didn't get paid because something went wrong at IAG. Can one estimate this risk by looking only at the main lines? In the case of IAG definitely not. Furthermore, if a risk becomes reality the minister will be informed by the ministry, not by IAG. In other words: at that moment the ministry has to know much more than the main lines.

And by the way: is the ministry saying that it approved a program of M€ 45 on the basis of the

³⁹ Van Velsen heard very little. Why? When he asked, he got no satisfactory answer.

⁴⁰ This is from personal recollections of the author.

⁴¹ The letter can be found in the directory Renewal, under 20060529. It doesn't mention the size of the budget.

⁴² The memorandum can be found in the directory Renewal. It is probably of an earlier date, possibly 11/7/06. The metadata show that it cannot be of a later date.

⁴³ If the council had the same- almost useless- information as the ministry it clearly couldn't.

main lines?⁴⁴

The conclusion is that the position taken by the ministry with respect to the various responsibilities is untenable, unrealistic, and increases the risks (by creating ambiguities).

A masterplan/ PID.

A document called “Masterplan/ PID⁴⁵ 2nd half of 2006” was completed 28/9/06.⁴⁶ Remarkable about this plan is that:

1. it wants to do (very) many things simultaneously;⁴⁷
2. specification of the results is missing;
3. alternative schedules are missing;
4. an exit strategy is missing;
5. in spite of recent negative experiences the ministry accepts this.

Nobody seems to have proposed to start with a more restricted, less pretentious agenda.⁴⁸

An exit strategy is a plan for periodic evaluation of the progress of the project, and allows for the decision to stop parts of the project. To avoid further waste if continuation is found to be ineffective or impossible.⁴⁹ An exit strategy tries to optimize the results of the project even if it cannot be completed, or if parts of the project are too difficult or fail for other reasons. It is a kind of risk management.

The table of products on the pages 42 and 43 of the Masterplan/PID is amazing. It clearly shows that IAG still doesn't know what it is going to do. It only knows that everything should be made better. The table gives a list of goals and corresponding products. The text above the table is the following:

«1.8 Products and services to be delivered

In this section the end goals to be realized are translated into the products and services delivered by the program».

This is how the goals, products and services are “specified”:⁵⁰

Goal	Milestone
Better process architecture	Process architecture delivered
Better system architecture	System architecture delivered
Better processes	New etcetera
Better systems	New etcetera
Fitting organization structure	Reorganization completed
Etcetera.	

Estimates of the costs of the project can be found on p. 53 of the Masterplan/PID. The total costs for 2006-2010 are estimated at 54.2 M€. As from 2010 the completed project should yield savings of

⁴⁴ It didn't even know or understand the main lines. For the most important main lines are described in the mail of Van Velsen quoted earlier, and these admit of only one conclusion: no money for this “plan”, and without proof of competence.

⁴⁵ PID= Project Initiation Document. According to for example Prince2 such a document should specify the project, including goals and intermediate and end results.

⁴⁶ It can be found in the directory Renewal, under 20061002.

⁴⁷ And many things seem to be independent of each other. They could be tackled separately, and at different times.

⁴⁸ Both Supervisory council and ministry could and should have done this.

⁴⁹ People may learn in the course of a project. They may learn that they pretended too much, and should have been much more modest, for example. An exit strategy creates possibilities for such an acknowledgement and for scaling back.

⁵⁰ It is slightly better than the quote from the table suggests, because elsewhere in the Masterplan/PID one can find explanations of the meaning of “better”. But these explanations too are extremely subjective and open, and cannot be called specification. See for example p. 13 of the Masterplan/PID.

5.4 M€ per year.⁵¹ If correct this would mean that the investment is not profitable. For in 10 years most or all of the new or better systems etcetera will certainly be outdated.

2007.

The audit departments of ministry and of IAG express worries.

In the audit department of the ministry of education, Hemke Havinga is charged with IAG. In a memorandum of 7/2/07, she writes that the audit departments of ministry and of IAG recommend frequent audits of the project.⁵² The memorandum explains why this is a risky project. Havinga furthermore notes:

«Realization of the project may be the responsibility of IAG, but there is an undeniable relation with ministerial responsibility in the field of study financing».

Ministry and IAG sign a covenant.

In February or March 2007 ministry and IAG signed a covenant about the policy claim.⁵³ It includes the following:

«Starting points

- Management by the ministry is restricted to main lines, finances and political risks;
 - Only IAG is responsible for the realization of the program;
- [...]
- According to “Substantiation Policy Claim 2006-2010” of January 2006 the goals are:
 1. Improvement of reliability and transparency of study financing for the benefit of students and ministry;
 2. Reduction of development, management, and product costs;
 3. Reduction of the time needed for system adaptation to changes in regulation.»

The first two points confirm similar points in the memorandum *IAG policy claim 2006-2010*.

Information need of the ministry of education of 23/11/06. The covenant asserts that the role of the Supervisory council remains unchanged. With regard to reporting the following is agreed:

«Reports

The reports inform about the realization of the most important milestones or products to be delivered. Deviations from the planning are explained in terms of underlying causes. IAG informs about its plans for solution.

- The accounting of IAG will be aimed at a timeliness and depth which will enable the ministry to act in accordance with its responsibilities;
- Financial accounting will take place in the framework of the regular planning and control cycle. This means that the 4-monthly reports will provide a complete picture, and that there is no need for separate conferences about financial aspects;
- The concise monthly progress reports about IAG2010!⁵⁴ which are used for internal management purposes in IAG will be sent to the ministry as well. The format is given in the appendix;
- IAG will exert itself to provide the ministry additional information at request».

Comments by the audit department on IAG2010! and IAG's management information.

On 7/3/07 the audit department of the ministry published its report about the annual report 2006 of the ministry. The following is quoted from p. 27 of the report:

⁵¹ This seems to be hardly more than wishful thinking or rather wishful argumentation. Something similar can be said of the cost estimates, except that the terminology should be changed from “wishful thinking” to “wild guesses”. At least as long as the project and products are not specified much better.

⁵² The memorandum can be found in the directory Renewal under 20070207.

⁵³ The covenant can be found in the directory Renewal under 20070306.

⁵⁴ Another or new name for the policy claim program.

«In cooperation with the ministry, IAG has started IAG2010!, an ambitious program for renewal of both the management of the organization, the way of working, information systems, technical infrastructure and methods and techniques. We are worried about the limited progress. The scheduled milestones of 2006 have not been realized, and there is no up to date network planning. We will monitor the project closely.

[...]

Quality of management information still insufficient

The systems of IAG are not directed at the flexible provision of information. The architecture with respect to the provision of information for external partners is outdated. Some information processes are integrated in primary systems, and other information can only be obtained by means of easytrieves and queries. For the program IAG2010! it is very important to ensure good, efficient and flexible provision of information about the expenditure of the program budget».⁵⁵

Note that information available for the management of IAG can also be sent to the ministry. Conversely: if management information is so hard to get by, it may as well not be available for the IAG management either. Inadequate availability of management information may explain the lack of IAG accountability seen in the report about the costs of the maintenance of Studylink in chapter 3. IAG cannot give information which it does not possess. But it can at least explain why it can only estimate the costs, and how it did. IAG is accountable to the ministry. It has no excuse for not sharing the information it has available.

An important question for somebody or an organization (like the ministry) who is responsible for the proper functioning of another organization is: does the management of that organization have the information necessary for its management? For checking and improving effectiveness and efficiency? In the case of IAG the information may have been very insufficient. The top may not have known (and understood) what was happening in its own organization, even when it signed claims for specific (possibly imaginary) activities.

Hans Haring as featured in IAG AR 2006.

On p. 23 of the annual report 2006 of IAG one sees a photo of Hans Haring, chairman of the Advisory group. Below the photo one reads the following text:

«Hans Haring, manager in the department of Study financing of the ministry of education

The ministry has given IAG money for a renewal program intended to improve the existing organization. The money is spent well if the communication with the students is client friendly, if adaptation to (future) changes in the Study financing regulation will take less time and give better results, and if IAG works more efficiently. This requires renewal of the systems, so that IAG can obviate existing risks. This will not benefit only students. The taxpayer and IAG employees too will benefit from a properly functioning organization».

IAG's 12-month report 2006 on the progress of IAG2010!

The 12-months report of 2006, the last of the three 4-monthly reports of that year, reports as follows about the progress of IAG2010!:⁵⁶

«IAG2010! (formerly Policy claim)

The program IAG2010! aims at improvement of the processes in the production organization, with study financing as the spearhead, and in the supporting ICT organization. The program extends from the preparatory year 2006 to 2010, when the better and more efficient processes should be realized. In 2006 the project accumulated a delay of 3 months, but this has no consequences for the end date. As from March 2007 the business case and organization and its management will be reviewed by a firm which is enrolled by a European tender. By now the quartermaster organization has become a full

⁵⁵ The report of the AD can be found in the directory Renewal under 20070307. The quote is confirmed and underlined by a note under the table “Finances” in the “dashboard report” of February 2007, made on 22/3/07: «No numbers available due to problems SAP/CATS (IAG-wide issue)». This report can be found in the directory of this chapter.

⁵⁶ The report can be found in directory Renewal under 20070315.

fledged program organization directed by the former head of KS and an externally recruited program director».⁵⁷

(This is all).

At first sight this seems more positive than the report of the audit department. But upon comparison of the two the IAG report must be qualified as tricky. It calls 2006 a preparatory year. It doesn't note that milestones had been defined, and that these have not been realized. It does note delay. It does not mention cause(s) of the delay. It does not explain why the delay need not have consequences for the end date of the program. The announcement that the business case will be reviewed only as of March 2007 suggests that the preparatory phase will not be finished before April 2007. The last sentence, about changes in the organization, increases the doubts about the time schedule, because it takes time for people to work their way in, and for a new organization to start working smoothly.

The first 2 of the 5 sentences of the report are nothing new, and do not belong in a concise report. The paucity of information in the remaining 3 sentences is hard to reconcile with the agreement about the reporting in the covenant of February or March. It certainly doesn't have the «depth which will enable the ministry to act in accordance with its responsibilities».

Obviously, both ministry and Supervisory council should have asked for a more comprehensive way of reporting.

CapGemini regauges the strategy of IAG.

In the spring of 2007 the consultancy firm CapGemini has regauged the strategy of IAG. It did so at the request of, and in collaboration with, IAG. CapGemini elaborated the consequences of the regauged strategy for the organization. This resulted in a report “Expert vision IAG”⁵⁸ with recommendations in the following fields:

- «Organization and management
- Client and market
- Processes and ICT
- Culture and leadership»

The recommendations overlap and interfere with IAG2010!. The minutes of the meeting of the Advisory group of 26/3/07 assert that IAG said that the Supervisory council was told that «about 20% of the present strategic vision differs from the expert vision which is being developed». It is hard to believe that this exercise has simplified the planning of IAG. It seems much more probable that incompatibilities arose, and led to problems.

If it is assumed that the extensive policy claim of 2005 was based on serious reflection on the part of IAG, then it is incomprehensible that it requested CapGemini in the beginning of 2007, supposedly without consulting the ministry, to develop a new organization strategy, and that it rewrote the program on the basis of the new strategy. In any case, it failed to explain why this exercise was held when the program was more than a year underway, instead of before writing a plan for the program.

The ministry decides that the agencies IAG and IFC will be merged.

In the spring of 2007 the ministry announced that IAG and IFC would be merged. In the years 2007-2009 discussions about the merger, and preparations for the merger took a lot of time and attention, especially of managers. The more so since the merger was to be accompanied by a reduction of personnel and by removal of functions from Zoetermeer to Groningen.⁵⁹ Formally the merger became a fact on 1/1/10. But at that date the merging process was not yet completed.

The merger had consequences for the hard and software (systems) of IAG and IFC. The changes in this field would have to be proposed, designed and implemented by people who in normal circumstances worked on system development to implement changes in regulation, and in 2006-2010 also participated in IAG2010!

⁵⁷ The abbreviation KS is not explained in the text, but may mean client service (in Dutch: klantenservice).

⁵⁸ In directory Renewal under 20070705.

⁵⁹ The head office of IAG was in Groningen. That of IFC in Zoetermeer. Very few of their employees worked in offices in other cities.

On 11/4/07 uSG held a conference with the Supervisory council to discuss IAG2010!. The minutes of the meeting contain the following exchange:

«The ministry [= uSG] asks what the council thinks of the relation between IAG2010! and the possible cooperation with IFC. The council indicates that cooperation should take place on the basis of choices made».⁶⁰

Nothing was said about negative consequences for current activities and projects, and about the growth of (political) risks. It is incomprehensible why the council didn't reject the ministerial proposal out of hand, as being incompatible with its earlier decisions and the work program of IAG. Why it did not demand postponement until after the completion of IAG2010!, or proposed (or threatened) to round off IAG2010! as soon and as good as possible, and to continue only after completion of the fusion.

Publication of the Strategic plan IAG, and replacement of IAG2010! by a Renewal plan.

In July 2007 IAG distributed a *Strategic plan IAG* and a *Renewal plan IAG*. Chapter 7 of the last plan gives a concise description of the projects It positions them relative to IAG2010! or the expert vision. The Renewal program replaced IAG2010! One gets the impression that even more irons are put in the fire.

The ministry wants better reports.

On 2/8/07 Van Gent sent IAG a mail with an appendix specifying the required contents of the progress reports.⁶¹ The appendix betrays worries. It concludes:

«N.B. We also want to know who is going to pull what, and how care is taken of sufficient involvement. We also want to see that the original goals still stand».

The appendix doesn't say how often IAG should report. In its meeting of 15/10/07 the Advisory group decided that IAG should report monthly.

The present author hasn't found any report with the information requested.

PwC reviews Business case Strategic Plan 2007-2012 and Renewal Program.

In October 2007 the accountancy and consultancy firm PricewaterhouseCoopers (PwC) reports about a review of the Business case Strategic Plan 2007-2012, which includes the Renewal Program.⁶² The following quotes are from the summary:

«At the request of IAG PwC has reviewed the Business Case Strategic Plan 2007-2012. The purpose of the review was to give an evaluation of the business case (buca) for the implementation of the strategic plan of IAG for the period 2007-1012.⁶³ Objects of investigation were: the strategic plan, the renewal plan, and the buca as defined by an excel file.⁶⁴ The scope of the investigation is the substantiation and the financial calculation underlying the buca, with a focus on the assumptions made, and the commitment of the project organization. A review of the strategy itself, the plans for a new structure of the top management, the financing of the project, and its feasibility in relation with other IAG projects, do not fall inside the scope of this review.

The review was made in September 2007, and consisted in a combination of desk research and interviews with the top managers, program managers and controllers of IAG.

[...]

⁶⁰ Indeed, this seems a ridiculous reaction.

⁶¹ In the directory Renewal under 20070802.

⁶² In the directory Renewal under 20071009.

⁶³ According to Appendix 2 on p. 37/40 of the DGAO report on ICT projects dated 20071129 in the PPP-directory, a business case is «an objective justification of a project. It substantiates use and necessity of a project, supported by a cost-benefit analysis which does not only weigh financial costs and benefits but also qualitative ones».

⁶⁴ The version studied by PwC could not be found. A revised version 6 of December 2007 can be found in the directory Renewal.

In conclusion it can be ascertained that there is a qualitatively good and motivated team with a sound plan. However, because of its complexity and technological challenges the program will demand the utmost of everyone in the organization from high to low. This requires an approach which differs from what IAG is used to. Another complicating factor is the possible impact of the environment of the program (policy agenda and cooperation with IFC). If implemented properly, the given recommendations can amplify one another, and provide the transparency, dialogue and control which the team needs to succeed».

According to the first paragraph the scope of the review is rather limited. But the scope of the last paragraph is much wider than “the financial calculation underlying the buca [...] and the commitment of the project organization”. Someone who reads the report sees that its scope is much more in accordance with the last than with the first paragraph.

The observations of PwC in the report show an organization which was unable to make a good plan and to prepare itself properly for its implementation.⁶⁵ They show an organization which clearly hasn't learnt the lessons of the project Redesign, and a major program with insufficient transparency, dialogue and control. Someone who combines this insight with the fact that the project is already more than 18 months old cannot restrict himself to the conclusion that success depends on conditions which he should know are hard or impossible to fulfill. He should make a remark that to that effect, and say what needs to be done to make success probable (not just “more probable”). The conclusion of PwC can be read as a (covert) warning. But only a much more outspoken warning would have been compatible with the observations in the report, and with the honesty, candidness and regard for the public interest required by the code of ethics of auditors.⁶⁶

The review report itself (as distinct from the summary) consists of a series of observations, implied risks, and recommendations for risk reduction. For brevity we restrict ourselves to topics which are relatively easy to understand. Risks are only mentioned if they aren't obvious. The numbers have been regrouped to fit the headings.

Please remember that IAG called 2006 the preparatory year, and that the observations of PwC concern the situation in September 2007.

With respect to the transparency of the business case and financial accounting.

«Observation

1.11. Costs and benefits have been localized, but are not given per year per section. Financial substantiation has been elaborated with respect to costs and benefits bottom-up, starting with calculations of IAG2010! and Expert vision, and represented in totals according to the subjects listed in the strategic plan. On the basis of this buca it is impossible to find out which project results cause which costs and benefits as a function of time. Total savings (fte) per section are given, but not as a function of time and not coupled with specific project results. Computational rules and rates have not been applied consequently [...] This insight may be obtained by coupling several documents.

1.21. IAG New includes IAG2010! However, on the basis of the buca it is difficult or impossible to trace which project results (including costs and benefits) have been accounted for with the buca of IAG2010! which was approved before.

Risk.

1.22. Insufficient transparency of agreements from IAG2010! may give rise to questions by the ministry».

With respect to project management.

«Observation

⁶⁵ Contradicting the conclusion cited earlier.

⁶⁶ See chapter 4, search for INTOSAI.

1.38. The PID's of the projects remain to be elaborated. At this moment there is no detailed picture of the planning and critical resources. According to the buca results have to be delivered in 2007 and 2008.

1.24. The duties, responsibilities and authority of the program managers and across the programs have not been made explicit.

1.25. It has been decided not to appoint a manager above the program managers.

1.26. Most members of the steering group and the program management have double roles (in line and project).

1.51. The interviews yielded general learning points for IAG: we find it difficult to say "no"; we are too kind for each other; we are bad at honoring agreements and addressing one another about this; we don't show our disappointment if we expect something of someone that isn't delivered; we put too many irons in the fire».⁶⁷

With respect to assumptions and delimitation.

«Observation

1.30. In the interviews of program managers a number of assumptions and boundary conditions were mentioned which were important to get results. At this moment these were mainly implicit assumptions and boundary conditions with respect to external parties, such as the ministry, and internal parties, such as other programs, projects and line activities. A policy quiet period for example. These assumptions and conditions have not been specified and made explicit in the buca IAG New.

1.68. In 2008 a development capacity is needed of 185,000 hours. This is not confirmed yet. There is anxiety about this number. It may be impossibly high. The capacity needed for policy [changes], maintenance and activities for the ministry of health (MH) are not clear yet.

1.69. The maximal development capacity of IAG is approximately 450,000 hours (regular years need between 350,000 and 400,000 hours). For 2008, the present development agenda, maintenance, MH and IAG New together require 525,000-550,000 hours. This seems to exceed the possibilities of IAG.

Risks

1.70. Insufficient capacity to fill the project needs. Delays and failure to realize goals/results and related benefits timely.

Advice

1.71. The competent authority in IAG should take a decision about this as soon as possible. It is very probable that [ambiguous text skipped] choices must be made about what IAG can realistically cope with.

Observation

1.72. Many important positions in IAG are still changing, while IAG New requires a relatively stable organization. It is important that the names of the new head of Client services and the new head of Human resources are announced soon.

1.75. A heavy time with many different priorities awaits the program managers: line, project(s), renewal in the line, future cooperation [with other parts of IAG, IFC].⁶⁸

The question is not only what can be done about defects and problems, but also what the defects

⁶⁷ Note that this refers to interviews of "the top managers, program managers and controllers of IAG".

⁶⁸ Slightly edited ("polished"), as some other observations of PwC, mainly because the original text is slightly illogical, incorrect, ambiguous etcetera. One frequently gets the idea that efforts to find a text compromise have been cut short by some time limit.

and problems say about the organization and its employees, given its history. And whether it is reasonable to expect that an organization which doesn't correct itself after a failure like that of the project Redesign, let alone before starting a similar project- as implicitly shown by PwC- can successfully run and complete such a project. Since the snapshot of PwC shows the project when it has already spent 20 of its 60 months, one may safely conclude that this is very improbable.

But PwC fails to consider its observations in the light of the history of IAG and of the fact that the project is 20 months old. It also ignores the fact that the IAG top management decided to make a new strategic plan at a time that much energy was being spent on a project that intends to renew almost the whole organization. Don't these facts say much about the top management of IAG? And indirectly about the risks of the Renewal program? One furthermore wonders how PwC, notwithstanding its impressive list of observations, can speak of a "qualitatively good and motivated team" and a "sound plan".

Obviously 1.71 is very good advice. Even though it is an understatement to call insufficient capacity in 2008 a risk instead of a certainty. And worse: the advice has been left to rot in the main text. It is not repeated in the summary, which breathes an optimism missing in the main text.

Reaction of the ministry on the PwC report.

Let's now see what the ministry did with the report.

In the minutes of a meeting of 15/10/07 with recommendations for uSG, the Advisory group mentions the report of PwC.⁶⁹ It says nothing about the contents of the report. It tells uSG:

- «As a condition for change, IAG demands: "the ministry implements measures simplifying regulation of study financing". This condition is not realistic. The ministry sees the proposals of IAG as suggestions to be checked on feasibility and desirability;⁷⁰
- As another condition, IAG wants to employ its development capacity only for the implementation of the policy agenda and the Renewal program. If this is not permitted, risks will arise».

The memorandum concludes:

«Risks

The plans require an appreciable development capacity. In 2008 there would even be a shortage. However, on the basis of the known and supposedly unchanged principles, IAG expects the development agenda to be "manageable". The Advisory group perceives this as a precarious equilibrium. The present plans moreover do not take the extra work for the cooperation [= merger with IFC] into account. For this reason the going concern may be endangered.

In addition, in the opinion of the Advisory group, the workload of the program managers is a risk.

Recommendation.

uSG is advised to discuss these points with the Supervisory council. The ministry should press for reduction of the scope, whereby non-related activities IAG2010! should be considered critically».⁷¹

In other words: neither of the conditions will be satisfied.

If this is seen in the light of the observations of PwC, it is clear that the political risks are very high, and increasing. It is almost certain that at least some of the goals will not be reached according to schedule. And that it would be nice if delay was the only price to be paid for asking too much, for PwC also shows a dangerous lack of necessary abilities (even if implicitly).

Note that IAG now has three large scale operations on hand: the policy agenda, the renewal project, and the merger. All three affect the whole organization.

The ministry could have known from the beginning that the renewal plan would demand very much of IAG's development capacity. This is easily seen by comparing the regular yearly budget for system

⁶⁹ The minutes can be found in the directory Renewal under 20071023.

⁷⁰ This interpretation is incompatible with the report of PwC.

⁷¹ The lack of clarity/ ambiguity is from the original.

development of 9 M€ with the budget of 55 M€ for 5 years, or 11 M€ per year, for Renewal. In other words: IAG would need twice as many people for system development. People who are highly trained and hard to find. Where could IAG possibly find them, even in quiet times? Nobody asked this question. The top managements seem to have thought that money can solve everything. Without thinking any further.

The DGAO publishes “Lessons from ICT-projects in the government”.

On 29/11/07 the (Dutch) General Accounting Office published Part A of its report “Lessons from ICT-projects in the government”.⁷² The recommendations can be summarized as follows:

- Be realistic;
- Be a full-fledged discussion partner;
- Phase decision making;
- Do not decide without substantiation;
- Enable review.

The ministry paid no attention to this report. In particular it drew no conclusions from the report as to its way of decision making.⁷³

PwC evaluates implementation of its recommendations.

At the end of its report of October, PwC lists some recommendations which had not yet been implemented at the time of its completion. In an additional report of the beginning of December, PwC concludes:

«For the moment the recommendations which had not been implemented in October have been implemented sufficiently. In our opinion, the conditions for making a good start with the program are fulfilled. The risks mentioned in the report of October remain important points of attention for the project. A prominent place of the program on the agenda of the executive team is important for support, to monitor progress, and to take important decisions. We recommend periodic reporting with respect to the full buca (including a review made outside the program management), for example twice a year, in May and November».

Having read the minutes with the recommendations of the Advisory group of 23/10/07 it is hard to understand that PwC believes that the conditions for success have been fulfilled. Isn't it simply a fact that they are not?

Furthermore, what is meant by “for the moment”? This is especially mystifying in the light of the next sentence, which after all predicts a good start.

2008.

Gakeer makes another risk analysis.

There is a “Risk analysis planning study financing” dated 21/1/08.⁷⁴ It was written by Bram Gakeer, of PPP and datawarehouse fame.⁷⁵ His department Information policy had been asked “whether it perceives risks in the planning proposed by IAG for study financing”.⁷⁶ By which was meant the Renewal program. The analysis concludes with the following section:

«Measures

This analysis is largely based on documents provided by IAG, and is limited to ICT aspects. It is meant to indicate possible risks at an abstract level. It is essential that the indicated risks are discussed with experts from IAG and IFC, to see which risks have been acknowledged and dealt with already,

⁷² In the directory PPP, under 20071129.

⁷³ This was “normal”: in general no attention was paid to external reports, unless the reports had been commissioned by the ministry.

⁷⁴ In the directory Renewal, under 20080121.

⁷⁵ See Chapter 2 on the PPP.

⁷⁶ The analysis doesn't say by whom it was requested.

and which additional measures are needed, if any.

In November 2007 a meeting of ministry and IAG decided that a workshop should be held in January 2008 to discuss the risks, and to see where synergy could yield benefits. This workshop can be seen as a first step towards elaboration of the risk analysis».

Gakeer makes no mention of the risks reported by PwC and those created by non fulfillment of crucial conditions. And to begin with: what was the need of an “analysis” like that of Gakeer, given the report of PwC? And what is one to think of the idea that the third year of a project of 5 years is begun with “a first step towards elaboration of the risk analysis”?

IAG's accountability report 2007.

An accountability report 2007 about IBG2010! and “Renewal IAG” by IAG is dated 31/1/08.⁷⁷ The following quote is the first paragraph of the introduction:

«This accountability report shows the results obtained in 2007 with IBG2010! (until 1/9/07) and Renewal IAG (as from 1/9/07). The date of 1/9/07 has prominent significance because on that day the management was changed radically. The new management is characterized by making those who are responsible for internal processes responsible for the program. They started with reduction of the interdependence of the different projects, so that the whole becomes less vulnerable to disturbances in the parts. The change cost some time, but the loss will be made good in the further course of the program. In other words: the management of the changes is now firmly rooted in the organization, the control of the different trajectories has been improved, and the risks of delay are decreased».

The quote suggests that an important source of risk and delay has been tackled. No mention is made of risks that remain. The report has no summary. It doesn't mention the review of PwC. The remainder of the report shows many (sub)projects, but no relationships. Neither does it explain why the accumulated delays do not require rescheduling of the planning and postponement of the end date of the program.

IAG's 12-months report 2007.

In the 12-months report of 2007, dated 13/3/08,⁷⁸ the following is said about the involvement of the Supervisory council:

«On 13/12/07 the renewal plan, including the corresponding buca, was approved by the Supervisory council and reviewed by PwC. It was agreed that every 6 months a progress report is submitted to the Council, an update made of the plans, and that they will be reviewed».

The second sentence is compatible with the text about the Supervisory council in the annual reports, but not with its role according to the covenant ministry-IAG:

«As supervisor the Supervisory council should monitor and accompany the project critically».

Obviously, the council has not understood the reports of PwC.

Comments by the audit department on Renewal and IAG's management information.

P. 28 of the report of the audit department of the ministry about the Annual report 2007 of the ministry gives the following evaluation:⁷⁹

«*Renewal program gives possibilities, and reasons for anxiety*

[...] In this [Renewal] program IAG has a unique opportunity to repair a number of weak points in old systems and to participate in a proactive way in some current developments in digital government. In the summer of 2007 IAG radically changed the organization and management of the Renewal program, and made the line organization responsible. Partly due to the formulation of new plans, progress in 2007 has been limited, also as regards milestones. The end date has not changed however, and because of the well-filled policy agenda and the merger with IFC we are worried about the feasibility of realizing the totality of projects in agreement with the plans. Because of the accumulation

⁷⁷ The report can be found in the directory Renewal, under 20080131.

⁷⁸ The report can be found in the directory Renewal, under 20080313.

⁷⁹ The report is dated 13/3/08. It can be found in the directory Renewal, under 20080313.

of developments we also see a risk for the quality of the going concern.

Improvement of quality of management information insufficient

One more shortcoming needs to be mentioned. IAG gets many information requests from external parties, and the internal interest in management information is increasing. The present systems of IAG are not very well suited for flexible and fast information retrieval. The architecture of the systems is outdated, and basic data are stored in different systems. This creates the risk of inconsistency. Information is mostly obtained by easytrives and queries».

Why don't the auditors use (and respect) the reports of PwC and the GAO? Why don't the auditors clearly and unambiguously say that for these reasons (to be listed) it seems improbable that the plans will be realized according to schedule, and that it recommends limitation of the scope and/or rescheduling the program in order to prevent accidents? If supposedly independent auditors ("watch-dogs") don't give such obvious and easily founded warnings and recommendations, who will?

uSG replies to IAG requests of a year ago.

Around 4/6/08 uSG replies to a letter of the head of IAG of 6/8/07 (!) with eleven proposals for accommodations of regulation to simplify its implementation.⁸⁰ She notes that some proposals are already being elaborated. She proposes to elaborate some others. She considers the remaining proposals infeasible.⁸¹ She does not indicate how IAG can solve the difficulties which the proposals were supposed to remedy or alleviate.

Advisory group concludes that overall progress is good.

The discussion in the meeting of the Advisory group of 16/6/08 concerned issues of minor importance. The issues were analyzed poorly. There is no awareness of serious problems, and no sense of danger or urgency.

Section 3g of the minutes of the meeting begins as follows:

«Review of PwC and conclusion

The chairman notes that the review of PwC has been a good learning experience. The chairman concludes that overall the progress of the renewal plans is good».

The minutes don't explicate what has been learnt. The remark about the progress may be based on the report by IAG to the Supervisory council, dated 30/5/08.⁸² It suggest that everything is all right.

Haring leaves the Advisory group and Study financing.

The meeting of the Advisory group of 16/6/08 was chaired by Haring. That of 1/10/08 by Nico Slooff, financial assistant to uSG and SG. Haring had left the section Study financing of the department of HE. He had become head of the section Finance of the department of Arts. A new permanent chairman of the Advisory group had not yet been found and appointed.

An audit of the duties, responsibilities and authority in the Renewal Program.

There is a (draft) report of 16/7/08 by the audit department about a "follow-up audit of duties, responsibilities and authority (DRA⁸³) in the Program IAG2010! c.q. Renewal Program".⁸⁴ The audit has the following

⁸⁰ Both letters can be found in the directory Renewal, under the dates mentioned.

⁸¹ The difficulties addressed by IAG are caused, or mainly caused, by parliament and the education minister. They make laws and rules which are at least very hard and costly to implement, and sometimes impossible. For example if they turn out to generate inconsistencies.

⁸² It can be found in the directory Renewal, under 20080530. See especially the conclusions on p. 14. They probably should be qualified as misleading (if not incorrect).

⁸³ Presumably this is a standard form of audit.

⁸⁴ It can be found in the directory Renewal, under 20080716.

«Goals

1. Check whether the distribution of responsibilities and work between NEA and IAG matches, and complies with the “Memorandum Agreements”;⁸⁵
2. Provide insight in the way IAG sets priorities in cases of conflicts of interests between going concern, renewal program, and merger;
3. Find out whether the recommendations from the audit DRA Program organization IAG2010! were followed up in the Renewal program;
4. Find out whether adequate measures were taken to reduce the risks mentioned in the first audit;
5. Find out whether adequate measures were taken to ensure that those line managers (with a full time appointment) who are program manager as well, can deal with the extra work in an acceptable manner;
6. Find out whether in the DRA’s in the new organization of the Renewal program new problems c.q. new risks arise.

[...]

Implementation of the audit

The audit began with the formulation of an audit plan and a framework of norms. The available documentation of the Renewal program was studied.

In a talk with the coordinating program manager he was given the framework of norms with the recommendations of 2007. He was asked to fill in and document the measures taken in pursuance of the recommendations. After a discussion of the framework of norms the measures were evaluated.⁸⁶

The evaluation took place with the help of the documentation and interviews with the most important people in and around the program.

In order to hear both sides, the minutes of the interviews were discussed with the people interviewed».

As regards the conclusions of the audit, the table of contents of the report suffices for the purposes of this study:⁸⁷

- «
 - 2 Audit outcomes
 - 2.1 Distribution of responsibilities and work is clear
 - 2.2 Norms for setting priorities are not described
 - 2.3 Recommendations from audit DRA 2007 were followed up
 - 2.4 Most important risks met in program organization
 - 2.5 Sufficient measures to prevent overburdening
 - 2.6 New risks are acknowledged
 - 3 Recommendations
 - 3.1 Keep clear agreements with NEA about renewal program
 - 3.2 Risk signals may be set up more formally
 - 3.3 Give sufficient attention to organizational part
 - 3.4 Formulate (limited) guidelines for setting priorities
 - 3.5 Keep giving attention to the relation with the ministry
 - 3.6 Report monitor independent
 - 3.7 Take care not to overburden program managers».

Like the other reports, this one contains inconsistencies. An example is that of the new risks. Section 2.6 mentions 3 of them, and concludes:

⁸⁵ NEA= new education agency.

⁸⁶ “measures were evaluated”. How? By documents and interviews, or by evaluation of the (practical) results? The main question here being: is this purely a paper and talking exercise, or are intended practical effects evaluated in the light of program and/or organization goals?

⁸⁷ Several of the original formulations are ambiguous. The ambiguities have not been resolved, but may not be exactly the same as in the original.

«The people interviewed acknowledge the first risk»⁸⁸.

Not the others? Why then does the audit report assert “New risks acknowledged”?

As in the quotes, the auditors only refer to their own reports. Not to any other report. As if DGAO, PwC and others never studied IAG, or don’t exist. According to the report, the audit consisted of the study of two documents⁸⁹ and twelve interviews, all of them with managers who had responsibilities for the program and/or IAG.

The review of PA Consulting Group.

On 31/10/08 PA Consulting Group (PACG) submits a *Review of Results of the Renewal program IAG* to uSG.⁹⁰ The review is defined as follows:

«The review request

The ministry has asked us for an independent evaluation of the renewal program of IAG, in order to gain insight in the risks for the ministry due to the program. The risks may concern costs or time schedule, the quality of (future) services rendered by IAG, or the public image of IAG or the ministry. Beside a critical evaluation, the review request allows for consideration of opportunities and possibilities which can make the program successful».

PACG wants the review to supplement the work of PwC. Of the inquiries made in the course of the renewal program, those of PwC and PACG seem to be the most helpful for understanding its evolution. But just like the PwC report, the report of PACG has weaknesses. A major weakness is that the review request and the contents of the report are inconsistent with the assertion about the supplementary character and the disclaimer, in combination with the absence of a description of the method of inquiry and substantiation of the assertions. In the section *Conclusions and recommendations* the limitations are forgotten. In the end the weaknesses are fatal: the report doesn’t distinguish more and less important issues and recommendations.⁹¹ Which creates the danger that necessary measures are not taken, and- in this case- failure is not averted. The combination of much useful information and essential gaps is characteristic for almost all “official” inquiries studied in the present report.⁹²

For the purpose of its review PACG distinguishes two central topics:

- The management by ministry and Supervisory council;
- The program: planning and implementation.

Apart from the introductory sections, the report consists of a section *Most important observations* and a section *Conclusions and recommendations*.

In the section *Most important observations* we read:

«*The management by ministry and Supervisory council*

1. The program is discussed in bilateral talks between IAG, the Supervisory council, and the ministry. But as regards the Renewal program, IAG reports only to the Supervisory council. The quality of the way in which ministry and council fulfill their roles depends strongly on the relevance and transparency of the information provided. There is a lot of documentation, and IAG makes it available completely and openly.⁹³ For the ministry and the Supervisory council the information is not

⁸⁸ Sic. On p. 8. Amazing but true.

⁸⁹ See p. 11 of the audit report, the first page of appendix 1.

⁹⁰ The report can be found in the directory Renewal, under 20081031.

⁹¹ Isn’t the last recommendation (number 5, see below, in the main text) the most important?

⁹² Much of this can be explained by too heavy, insufficiently critical, reliance on interviews with the interested organizational establishment. P. 13 (of 13) of the report gives a list of the persons interviewed, and their functions.

⁹³ The source of this remark seems to be an interview (in combination with blind faith), for it is incompatible with the report of IAG to the Supervisory council mentioned earlier (document 20080530). This report definitely is not open.

easily accessible, and is sometimes perceived as “concealing”.⁹⁴ There is no contact between the information asked and provided on the one hand, and

- The roles of the different actors
- The goals of the bodies of which these actors are a member.

This has consequences for an effective implementation of the roles of the ministry and Supervisory council, and is not efficient for IAG either.⁹⁵

2. The ministry has the role of financier. Directly or indirectly it will bear the financial consequences of the program. But on account of political risks the ministry is not only interested in financial aspects. It has a great interest in the success of the program. It is not primarily responsible for the program: that role is played by the Supervisory council.

In the “Agreement of ministry and IAG about the financing of and responsibility for the program” it has been agreed that the ministry “keeps a finger on the wrist”, and that “management by the ministry is restricted to main lines, finances and political risks”. The ministry tries to manage the political risks through its role as financier. This has not been made explicit however, and its present role and means do not enable it to serve this interest properly.

3. The ministry tries to limit its financial risks by only making money available when (intermediate) results have been realized. This requires unambiguous definition of those results, and the ability to evaluate the results in the context of the program as a whole.

- The definitions of the results which are financially important lack necessary clarity.⁹⁶ Moreover, the importance of the milestone and the financial consequences are not always proportional;
- The role of the ministry requires the ability to evaluate the relevant results. The ministry lacks this ability.

As a consequence the financing procedure is not sufficiently effective.

4. The lack of clarity about the different roles means that it is not clear who has the final responsibility for the realization of the program (Supervisory council) and the financing (ministry): there is no place or person where both aspects meet. According to the agreement between ministry and IAG, IAG and only IAG is responsible for the realization of the program. The financial flows and the responsibility for them are insufficiently clear.⁹⁷ This may cause risks affecting more than the program budget of IAG. [...]

5. In the evaluation of the functioning of the various bilateral talks it is noticeable that they hardly make decisions. The talks are mostly used to inform one another. It is not always clear what is discussed where. It is furthermore noticeable that if the Renewal plan is discussed at all, it is hardly done from the perspective of the future IAG, even though this should be the basis for managing the Renewal program. The organization of the bilateral talks and the decision making have to be sharpened. A shared vision for the future is an important beacon as regards contents».

The paragraphs about the program are focused on the management of the program and the projects of which it is composed, and on financial aspects. The remarks of PACG are similar to those of PwC. There are lots of doubts and questions, but PACG doesn't say how important they are.

The following is the slightly abbreviated section *Conclusions and recommendations*.

«Program

⁹⁴ Again, this is incorrect, see document 20080530. It is clear as crystal, but far too rosy.

⁹⁵ The text is incorrect and misleading. There was no information for example showing that IAG would be able to run Renewal successfully. After Redesign, progress with improvements (if any) had not been monitored.

⁹⁶ Compare this with the observations 1.11 and 1.21 of PwC. The present remark seems to hide a lot. (What about openness?)

⁹⁷ At least in the formal sense this is untrue. The ministry and only the ministry pays, through uSG. The Supervisory council is not involved.

The road taken has led to visible results.⁹⁸ The challenge is to hold on. If the program is continued without changes there is an appreciable risk of not realizing the desired result(s). In our opinion a purposeful, fundamental regauging of the original framework and approach is necessary. This should be done in a way that supports the progress of the Renewal program and builds upon what has been accomplished.

Management

As a consequence of the most important observations it is insufficiently warranted that political risks are recognized in time. In the given situation the ministry runs risks due to the administrative context of the renewal program. The present role of the ministry is small in proportion to the appreciable interest of the ministry in success of the program. Formally the ministry depends fully on judgments of the Supervisory council. But the question is whether the members of the Supervisory council have enough time to play their role with the necessary thoroughness. Furthermore the role of the ministry with respect to political risks has not been implemented explicitly.

Cooperation

We saw that it is difficult for the ministry to imagine itself in the situation of IAG as the “factory” which it actually is. We also saw that the management of IAG finds it difficult to imagine itself in the role of the ministry with its political responsibility. [...]

Recommendations

On the basis of our observations we have the following recommendations:

1. Make the roles of ministry and Advisory group explicit. Streamline the information flow from the program in such a way as to enable the roles. Less information, but more relevant. Be clear about what is discussed and decided where.
2. Make internal [instead of external] employees responsible for the management of important parts of the program (such as implementation of the rules engine and data management). Selectively recruit talented people who can fulfill this function, can bring things together, persevere and complete.
3. Direct the program more “from the outside in”. That is: direct all programs and activities as much as possible from the administrative viewpoint, the vision of the client and ministry, the services of IAG and the service model. Use this to bring coherence in the programs.
4. Implement the program “Culture and leadership” concretely. The present operation and recent performance problems offer good and concrete points of contact for this. Use them also for concretization of the Renewal program.
5. Regauge plan and buca on the basis of realistic assumptions. It is important to find a balance between ambition and a realistic expectation about what is feasible under what conditions.⁹⁹ Formulate the buca on the basis of the future service model and quantitative information about production volumes which is available in IAG. The savings are a result of this.

It is important to note that much of the information needed to implement the above is available, but spread over many documents and heads of employees. The regauging offers an opportunity to bundle knowledge and insight, and to refocus on goals and results. There are many good building blocks to build on.

To conclude

The formation of NEA is outside the scope of this review, but may have large impact on the realization of the renewal plan and the distribution of roles. In interviews it was said that people are already anticipating on the future situation. This observation, the earlier observations, and the fact that IAG is running into the limits of its capacity, are reasons to review goals, and reset priorities. This

⁹⁸ The results are not described in the report.

⁹⁹ Logically speaking, the sentence means that the ambition need not be feasible. The “important note” following this recommendation reveals a serious lack of coordination and management. This can only amplify existing doubts about IAG’s and the ministry’s ability to successfully define, plan, and execute a program like Renewal. Of course, it also amplifies doubts about the integrity and competence of PACG.

requires close collaboration of ministry and the top management of IAG».

Reactions of IAG and ministry.

A meeting on 3/12/08 with uSG, the reviewers of PACG, representatives of IAG and some co-workers of the ministry agreed about some actions to be taken to implement the recommendations of PACG. In this meeting IAG said that the regauging had already taken place:

«Some of the results are: an updated approach, buca, and milestones for 2009. Attention has been paid to alternative scenario's ("silver and bronze"), and one scenario has been chosen. For this reason the scope has been reduced».¹⁰⁰

It is agreed that the updated approach and buca will be discussed by the Advisory group in its meeting of 18/12/08.

In its meeting of 18/12/08 the Advisory group decides to submit the plan for rescheduling of the program to uSG for approval.

2009.

Doubts about Renewal voiced in the MTM.

Point 11 of the agenda of the meeting of the management team of the ministry (MTM) on 9/2/09 was entitled "Policy and implementation: follow up of the advice Voigt". It concerned the management of NEA by the ministry. The minutes of the meeting include the following sentence:

«DGHPE has been told that the project IAG2010! is not going well. DGNEA will pick this signal up».¹⁰¹

DGNEA must have been well informed. Obviously he didn't want to discuss the project.¹⁰² uSG was present too, and must have been informed just as well. But she too remained silent. In the minutes of the two following meetings of the MTM nothing could be found about the way in which DGNEA or whoever had "picked up the signal".¹⁰³

Van Gent succeeded by Ben Salah. Irritation about the rescheduling of Renewal.

On 16/2/09 Van Gent, assistant of uSG for IAG, moved to another function in the ministry. As regards the Renewal program she was succeeded by Faïrouz ben Salah. On 2/3/09 Ben Salah sent DGNEA a memorandum in preparation of a meeting he would have with IAG about the rescheduling of the program.¹⁰⁴ The memorandum contains the following paragraph:

«Reason

The reason for the meeting is the rescheduling of the Renewal program of IAG. Rescheduling was necessary because the program "old style" had become unmanageable and ran out of hand financially. The decisions were taken at short notice with approval of the Supervisory council, without adequate consultation of the ministry. This gave the ministry the idea of having been checkmated. Formally the ministry has not been informed. For that reason it has not reacted yet».

The rescheduling had been announced in the meeting of 3/12/08.¹⁰⁵ The minutes of the meeting show that both uSG Roos and DGNEA Kerstens were present. Nobody of the ministry reacted to the announcement of IAG. Maybe the ministry thought that this was the responsibility of IAG and Supervisory council. Or the ministry may have been inadequately prepared, or listened badly. Furthermore, delay and rescheduling must have been in the air and expected. The ministry could and

¹⁰⁰ The minutes of the meeting can be found in the directory Renewal, under 20081203.

¹⁰¹ The minutes can be found in the directory Project and agency management, under 20090209.

¹⁰² In spite of the openness required by the code of conduct of the ministry.

¹⁰³ The author didn't look further.

¹⁰⁴ Note that the 12-months report suggested that the rescheduling was a matter of the past.

¹⁰⁵ Moreover, the meeting of the Advisory group of 18/12/08 was explicitly titled "Rescheduling Renewal plan IAG2010!". The minutes of this meeting can be found in the directory Renewal, under 20081218.

should have proposed rescheduling itself, to reduce its risks. See the recommendations of the PwC and PACG reports.¹⁰⁶ As shown earlier, the ministry almost did the opposite.

A progress report full of green, and no red.

A relatively detailed progress report about the renewal project was completed 26/2/09.¹⁰⁷ The report looks like a snapshot. It is not clear to whom it is addressed. For a relative outsider it is difficult to learn something relevant from this report. Except when you trust the traffic lights. They suggest that it can hardly go better. 21 lights are green, one is yellow, and none is red.

The 12-months report of IAG about 2008.

The 12-months report of IAG about 2008 is dated 24/3/09.¹⁰⁸ The following is the section about the Renewal program:

«Renewal plan

2008 was the year of the transition from planning and preparation to actual implementation and realization. Concrete products were delivered, and in autumn a rescheduling was carried through. In accordance with agreements with the Supervisory council (SC), and preceded by an independent evaluation by PwC, the program plans and buca were updated in June. The observations [of PwC] were explicated to and discussed with the SC, and the recommendations implemented. The recommendations of a review by PACG are being implemented in collaboration with the ministry. These recommendations concern roles and information provision as from 1/1/10 (who decides what, who advises whom etc., and what are the corresponding responsibilities). The results will be put on the agenda of the regular 4-monthly meeting of April.

In agreement with the ministry and SC a rescheduling of the Renewal plan was carried through in October. This resulted in the introduction of a year model for the implementation of the Renewal plan with one business object per year. This resolves the cluttering of activities, and enables good management of dependences and critical paths. [...]

With regard to the financial contribution 2008 of the ministry the year plan IAG defined agreed milestones (physical products). At the close of 2008 it can be concluded that all milestones have been realized, except “migration My IAG” and the project “Pro-active information”»

Follows a table with milestones suggesting that everything that should have been realized is indeed realized. Ten times realization is 100%, once it is 98%, and once 95%. In accordance with the progress report of 26/2/09, with the 21 green lights. Given the history of the program and the various evaluations, this seems too nice to be true. In combination with the reports of PwC and PACG the progress reports suggest that the problems are bigger and deeper than the Renewal program.

And then there are hairline cracks:

- What has been rescheduled exactly?
- What does the rescheduling mean for the goals (at least if rescheduling means regauging (as recommended by PACG), as IAG indicated on 3/12/08)?
- What are the financial consequences?
- Is the Renewal plan still to be completed in 2010? If not, what is the new final year?
- It seems that IAG interpreted the absence of a reaction by the ministry to its announcements on 3/12/08 about regauging etcetera as agreement. This would be trickery, since IAG had not given the ministry specific information about the changes;
- Is it true that all recommendations of PwC and PACG have been implemented? Experience has shown that IAG cannot be trusted blindly;

¹⁰⁶ Sheet 22 of a presentation dated 11/12/08 even speaks of an “appreciable risk” of failure. The presentation can be found in the directory Renewal, under 20081211.

¹⁰⁷ It can be found in the directory Renewal, under 20090226.

¹⁰⁸ It is included in the directory Renewal, under 20090324. The quote is from p. 14. The date of 1/1/10 is in the original.

- The Renewal program started in 2005. 2006 was the preparatory year.¹⁰⁹ “2008 was the year of the transition from planning and preparation to actual implementation and realization”. But 2008 was also the third year of a planned lifespan of five years. Only outside evaluations mention difficulties, not IAG. Does this look like open and reliable information? Definitely not. But what is wrong?

Comments by the audit department on Renewal and IAG's management information.

As in the corresponding reports of the past few years, the report of the audit department about the Annual report 2008 of the ministry devotes some sections to IAG and the Renewal program:

«Ambition level Renewal program too high, but going concern all right

On balance, the quality of the financial management of IAG remained the same. IAG had to extend the duration of the Renewal program because the ambition level was too high, and the complexity had been underestimated. In the spring of 2009 the consequences of the rescheduling for employees and finances will be clarified. Together with the ministry priorities will be reset.

[...]

Ambition level Renewal program too high

In 2008 IAG concluded that the ambition level of the Renewal program was too high. This was caused by underestimation of the complexity of the present system of systems. The cooperation of old and new systems turned out to be more complex than expected too. On the basis of audits IAG furthermore noticed that the total capacity needed for the going concern duties, policy agenda, introduction of the education number in primary education, and the merger with IFC, leaves insufficient capacity for the original renewal schedule. IAG has chosen for rescheduling, adjustment of the ambition, and lengthening the program duration. In the first quarter of 2009 and the wider framework of NEA, IAG and the ministry will determine the consequences of the rescheduling for employees and finances. In general, know how, organizational embedding, and relations with other activities should be secured better.

With difficulty IAG has reached the milestones agreed with the ministry. Among others this concerns enterprise architecture, business portal, and a new version of “My IAG”. To improve project management, IAG has introduced a project portfolio.

[...]

Management information/ performance indicators still vulnerable

IAG receives many information requests from external parties. The interest in good internal management information increases. The present systems of IAG are not very well suited for flexible and fast information retrieval. The architecture of the systems is badly outdated, and basic data are stored in different systems. This creates the risk of inconsistency. Information is mostly obtained by writing easytrivies and queries. The problem has been tackled in the Renewal program. Progress has been made with respect to enterprise architecture, working under architecture, Basis Administration Person, and improved portals for the education institutions and the students. IAG should pay attention to the realization of flexible information provision in the new systems for study financing».¹¹⁰

But after the improvements, what is the auditors' judgment about the present state of affairs? What remains to be done?

IAG explains the rescheduling. (The presentation of 31 March 2009).

Although the roar of the waterfall could already be heard for a long time, nobody in IAG and the ministry wanted to acknowledge that the main progress was in the direction of the abyss. In 2009 the fall could no longer be averted. The crash was marked by three presentations of IAG, dated 31/3, 22/6, and 23/9.¹¹¹

¹⁰⁹ And probably only called preparatory by hindsight. The first mention of a preparatory year was found in the 8-months report 2006 IAG, dated 26/10/06. In the directory Renewal, under 20061026.

¹¹⁰ The report of the audit department can be found in the directory Renewal, under 20090309.

¹¹¹ All three can be found in the directory Renewal, under 20090331, 20090622 and 20090923.

On 31/3/09 IAG still seems to be thinking that it can keep or regain control of the program. On that day the rescheduling was explicated.¹¹² Rescheduling had been decided in December 2008. It meant spreading the (remaining) work over the years 2009–2012 instead of 2009–2010 (inclusive). In addition, the scope was limited to study financing. One of the sheets explains the reasons for the rescheduling as follows:¹¹³

- «The required capacity would preclude other development work;
- All development activities in IAG make use of the same scarce resources;
- An unacceptably high ratio internal/external personnel: costs and safeguarding know how;
- Other activities need much management attention (problems with production, Taskforce, fusion etc.);
- Specification of the migration showed that problems will arise in the middle of 2009;
- Introduction of new techniques cost more time and money than planned;
- 2008 was the year of milestones, 2009 the year of the heart of the service: quality first;
- More balance needed! Together with change managers an alternative scenario was formulated».

Why had nothing of this been said in the progress reports? The rescheduling operation shows that the progress reports were unreliable, that they reported selectively at best. Why then should we believe this new report?

Changes in goals. (The presentation of 22 June 2009).

The presentation of 22/6/09 is not or not only about rescheduling, but also about changes in the goals and scope of the Renewal program.¹¹⁴ Mention is made of a request of the SG: “[to] investigate reduction of scope in relation to reduction of risks”. The presentation presupposes problems, and the problems seem to be very serious. Beside options “Continue”, “Pause”, and “Partial pause”, there is even an option “Stop”.

Sheet 4 is titled “Analysis”. The sheet has the following text:

«What are the causes?

- Growing stacked complexity of old systems and new parts;
- Pressure by Policy and Going concern in the field of study financing gives extra complexity;
- Inadequate decomposition of plans and activities;
- Inadequate management (program leaders removed to other priorities);
- Too much dependence on external co-workers.

=> drop in productivity (products come later and cost more) => adjustment of plans => even more complexity => present form of renewal plan has insufficient chances of success (PwC)).

The points are supposed to be causes, but it is not explained of what. The state of affairs of the program is not described, and the development that led up to this state even less. Obviously, the points should at least be the causes of the need to reschedule and rescope. And therefore be similar if not identical to those listed in the previous section. Which evidently is not true. In other words: the exact weaknesses of the implementation of the program and of IAG remain uncertain.

The presentation chooses the middle option: “Partial pause”. It proposes to use the coming three months to elaborate manageable alternatives for the Renewal program,¹¹⁵ and in the meantime to continue with some parts of the program.

Informal discussion of the situation at the ministry (10 September 2009).

The following is a report by the author written to an acquaintance, one or two days after the

¹¹² Using the presentation dated 20090331. The quote is from sheet 3.

¹¹³ Unexplained examples which don't seem necessary for understanding have been skipped.

¹¹⁴ The presentation can be found in the directory Renewal, under 20090622.

¹¹⁵ Note that if the causes are identified correctly, the management has failed, and the Renewal plan may be manageable as it is. It probably isn't, for a reason which has not been mentioned: IAG wanted to do too much simultaneously. Of course, for a successful program more is needed than good management.

event.¹¹⁶

«Around midday 10/9/09 there was an informal meeting about the Renewal program. The participants were: Jacob Smit (IAG, account manager ministry), an investigator of Ernst & Young, and some of the co-workers of the ministry who had IAG or the Renewal program in their portfolio: Fons Cammaert (contact for IAG of the section Study financing of HE), Ben Salah, Slooff, Barbara Solleveld (manager of Cammaert), Haring, and the present author. Haring was late. Entering he said: "As you know, when I'm late, I have to leave early". Haring had been involved in Renewal from the beginning, in 2005; Cammaert and Solleveld for about a year. By the people of his section Haring was seen as the man who knew everything about the program.

The meeting took place because in a week or a few weeks IAG would send proposals to the ministry for a follow up. The proposals would include alternative options. MTM and SG would have to choose and decide. The participants of the meeting would have to advise them.

[...]

Smit and the investigator noted that IAG has the required knowledge and know how at the level of specific parts, but not at the level of aggregates.¹¹⁷

In his introduction, the investigator had repeatedly used the word "alternatives", without explanation. I asked what he meant. I noted that I had always been surprised by the absence of a long term plan for system maintenance and renewal, and a strategy for that. There seemed to me to be a big difference between making all changes in a single operation and making them gradually, as normal part of the business. The investigator shared this surprise, and showed serious doubts about the ability of IAG to design and implement a major overhaul of its systems in a relatively short time. It is very doubtful whether IAG has the knowledge and know how required for such an operation. In the field of management as well. It is clear in any case that up to now the program exceeds IAG's abilities.

In this meeting several things were said which help explain how things could run out of control. Slooff said that he had often seen progress reports which he didn't understand, but had accepted because he thought: "They are the experts". Actually they were not, and they were not reliable either. Of course I reacted: "As long as you don't understand, you simply say 'no'!".

Ben Salah supported Slooff by saying that one should work on the basis of trust.¹¹⁸ Which sounds nice, except that the meeting had been convened because IAG had shown that it could not be trusted.¹¹⁹ Ben Salah furthermore thought that problems should be solved by talking and good agreements, and by monitoring and discussing the follow up of the agreements. I reacted by noting that the present meeting is held because promises had not been kept, and that the question is: what to do then? New agreements generate a vicious circle. Instead, one should look for the causes, and try to fix them.

At a given moment, the investigator noted that a progress report which starts with red lights at the bottom of the hierarchy has a tendency to reach the top with green lights only.

Some of the people of the ministry said to have difficulties with their role and responsibility. They feel that they have insufficient expertise in the field of ICT, and find that they shouldn't want to know details. Haring thought that decisions about system development and choices of the best alternative should be made by IAG autonomously. I reacted with: "Maybe I feel the same, but it is an irrelevant opinion. Fact is that the ministry gets proposals from IAG, that SG will choose and approve, that our DG will advise him, and that we will be asked to advise our DG. We cannot say: 'IAG should decide for itself'. That would not be accepted. A decision will be made anyhow. So we have to advise, whether we like it or not. The only relevant question is: how?" Everybody agreed. I explained how I dealt with this kind of problem myself. That IAG has to convince me with understandable answers to critical questions. By asking questions I try to find out whether IAG can be trusted. If its answers are

¹¹⁶ The original can be found in the directory Renewal, under 20090914. No (official) minutes were made.

¹¹⁷ The same was said of IFC by Van Loon in connection with the policy portal project in personal communication with the author. In other words: there were no people who understood the coherence and could coordinate.

¹¹⁸ In other words: she preaches blind faith, and the opposite of a critical attitude. But a controller like Slooff has a duty to check. His function forbids him to simply believe. Ben Salah furthermore uses the argument selectively. With respect to most of her colleagues in the ministry she showed no trust at all: see the preceding two chapters for many examples. The remark is a trick to cover whatever you do, and to duck responsibility.

¹¹⁹ The assumption of Ben Salah had been shown to be incorrect.

unsatisfactory, I feel compelled to enter into details. Not because I want to know everything, but because I want to find out whether IAG understands, and can communicate about it. If they cannot communicate with us, am I to believe they can communicate among themselves?»

The evaluation by Ernst & Young. (The presentation of 23 September 2009).

Neither rescheduling nor rescoping could stop the fall. The presentation of 23/9/09 asserts that the Renewal program has “got stuck”.¹²⁰ Ernst & Young had been hired to find out what went wrong. Its report could not be found, but the presentation is clear. According to sheets 8-10, the following aspects are the “essence of the jamming”:¹²¹

1) Management (external/internal):

- «The relation between ministry and IAG is insufficiently clear:
 - IAG doesn’t know how to handle it;
 - The management by the ministry is dispersed;
 - The ministry comes with (stacked) changes in regulation, and expects that IAG can implement them properly.
- Decision making is often partial, and not always well-considered and consistent (under pressure);
- Too much management on process and method instead of contents. Use of knowledge is insufficiently enabled and assured;
- Too much room for individual interpretation (large distance between senior management and execution, insufficiently clear course of the program, archipelago of 1000 project islands);
- Instability of the course: ideas about the course, goals and scope changed permanently, in the course of time the center of attention in the Renewal plan shifted from changes in organization and work processes to system renewal;
- Insufficient management with respect to the coherence of the changes;
- The approach was too much activity driven.

2) Ambition in relation with adulthood of the IAG organization:

- Too much simultaneously in addition to policy implementation;
- Overestimation of adulthood/ know how/ abilities;
- The type of change/renewal doesn’t fit the operational character of the organization;
- Insufficient use of creativity of the organization/ fear of making mistakes;
- Some types of vital knowledge are scarce and used inefficiently.

3) Culture:

- Acting on the basis of dogmas, and also of stray shouts;
- Insufficient transparency (not willing or able to say no);
- Causing differences about problems in and outside IAG;
- Radical renewal: not directed at results/ lack of confidence in own abilities/ local power to act;
- Especially in the going concern, sometimes with negative effect on the whole;
- Law of conservation of complexity = conservation of work;
- Underestimation of resistance of the organization against change, so that much of the old was kept. Conservative forces often won from renewal, and corrective management was insufficient.

4) Management former (top) management:

- Division in management and lack of continuity affected organization and Renewal plan;
- Management of Renewal plan was influenced too much by divide and conquer policy;

¹²⁰ The presentation is in the directory Renewal, under 20090923.

¹²¹ Ambiguities have not been/ could not be resolved.

- There was insufficient communication about problems and results;
- Too much energy was spent on solution of symptoms, instead of tackling the real causes (external program managers were set aside)».

The next sheet, sheet 11, summarizes as follows:

- «Both internal (IAG) and external (ministry) management was too dispersed. As a consequence, the management of the Renewal plan was insufficiently stable and unambiguous, and left too much room for individual interpretation;
- The ambition of the plan was too high in relation to the adulthood and capacity of the IAG organization. The management of contents and the application of know how and business were insufficient;
- The unruly culture of IAG in combination with the complexity of the domain of study financing caused a deadlock in which small steps required steadily increasing amounts of energy;
- The management by the top did not contribute to a constructive work climate, and disabled appropriate reaction to images and facts».

Note that all inquiries and audits should have mentioned the same defects, problems and other causes of failure. Note furthermore that it is quite plausible that the aspects listed cause failure, but that this doesn't prove that the analysis is correct, nor that the points listed are the most important causes. In fact, not all "aspects" are true (or formulated correctly). The consequences of defective management are much more extensive than suggested in the last or other points. The (top) management and only the top management is responsible for the start of Renewal plan and its utterly unrealistic ambitions. The dispersal of the management by the ministry is nonsense. Substantiation is missing. IAG never complained, and knew very well that the ministry is a hierarchical organization, and that uSG is the only person or body speaking with real authority. On the other hand, the ministry and Supervisory council should not have approved the Renewal plan in the first place. They should have asked much better reporting,¹²² and should and could have pulled the brakes years earlier. None of which is said by Ernst & Young.

Informal meeting about advice for the sequel (September 23, 2009).

The file with the presentation of 23/9/09 was sent to the participants of a follow up meeting of the meeting of 10/9/09 reported above.¹²³ The following informal report of the follow up meeting was written by Van Velsen within a few days of the meeting:

«On 23/9/09 from 11:00-12:30 there was a meeting about a sequel of the Renewal plan. Present were Ans Gottenbos (head of the section Study financing of HE), Cammaert, Ben Salah (a quarter too late), Slooff, Onno van Zutphen ((u)SG control), Gakeer, Havinga, Smit, the representative of Ernst & Young, and Van Velsen.

After a long self portrait Gottenbos outlined the perspective of budget cuts, and the possibility that the law of study financing will be changed substantially.¹²⁴ Van Velsen added that Ernst & Young had concluded that IAG cannot deal with projects of a more complex nature, that it recommends talks IAG-ministry about simplification of the law, and that for these reasons NEA should participate in the talks about the implementation of budget cuts. This met with unanimous approval.

The discussion was hampered by Gottenbos and Smit taking much more time than necessary to say what they had to say. Maybe they were killing time on purpose.¹²⁵ In so doing they showed how these

¹²² In addition: why were the reports unreliable and misleading? This is not only a question of technical abilities, but also of integrity.

¹²³ The presentation discussed at 23/9/09 is dated 23/9/09, but was not given at that date.

¹²⁴ Budget cuts are made as a consequence of the financial crises, to be discussed in chapter 7..

¹²⁵ And not for a good purpose. Gottenbos had been head of the section Study financing for many years. She therefore bears a large part of the responsibility for the failures of IAG. There cannot have been any real cleverness in the time-killing. It seems much more probable that it was caused by infatuation and/or escapism.

discussions and processes can go wrong: important matters are not discussed due to waste of time on less important matters. In the meantime I got the impression that I was the only one who had read the report (the sheets). Nobody referred to it, or to specific conclusions.

The discussion showed that “development of people and organization” was conditional for any successful sequel.¹²⁶ So this should get the highest priority. Therefore Van Velsen asked why it was mentioned last in the list of proposals on sheet 52.¹²⁷ He asked for a development plan.¹²⁸

The proposals on the sheets were not from Ernst & Young but from IAG. They were not from the top, but from the bottom. This followed from an explanation by Smit of the absence of a time schedule, and the absence of thinking in terms of a plan for number of years.¹²⁹

The last minutes of the meeting were wasted by a squabble of Gottenbos and Ben Salah about the number of sheets of the presentation which had to be prepared for the SG. 10 or 12? When they didn’t stop, Van Velsen proposed 11.¹³⁰ This was accepted. In reality the number became 17.

The main conclusions of Ernst & Young or of Ernst & Young and IAG together seem to be the following:

- People and organization failed; they put too many irons in the fire.¹³¹
- A major renewal operation is not necessary. The existing system is adequate for at least several years to come.

On the basis of the discussion the following remarks can be made about the proposal:

- It was formulated by the existing organization (which had failed utterly, and had not been open about its difficulties);
- The question whether the short term proposals are a good start of the long term approach has not been answered;
- There is no long term plan for gradual development (even the idea is missing);
- Its first phase should consist of the development of people and organization. It should result in an organization which can adjust and correct itself, and work permanently on more effective and efficient production;
- The timing and priorities of the other phases or activities should be properly argued;
- The analysis of Ernst & Young shows, but the proposals do not, that the internal communication and the communication with the ministry should be improved. Because of the costs for the taxpayer and the political risks, NEA should be able to communicate about plans and investments in a way that is understandable for the ministry, so that the ministry can properly account for its approval or refusal thereof;
- The ministry should not approve anything it does not understand, and never accept silence or mystifying language for an answer».¹³²

HE's recommendations for the SG.

On 29/9/09 Cammaert sent the following remarks to Ben Salah on behalf of HE.¹³³ The remarks were to be used to prepare the SG for the discussion about the presentation by IAG:

- «It is sensible that IAG renounces major system changes in the short run, and wants to

¹²⁶ Also in the light of the failure of the previous project Redesign.

¹²⁷ No meaningful answer was given.

¹²⁸ It never came. The reports of NEA show that it has never been implemented, that only lip-service was paid.

¹²⁹ The sheets distinguish short and long term, but don't define these concepts, en nowhere mention years. Van Velsen feared that the vagueness foreshadowed indefinite delay, in other words that once more insufficient improvements would be realized.

¹³⁰ He knew from experience that any agreement would probably not be kept. The squabble was meaningless.

¹³¹ There is no reason to assume that sufficient improvement has already taken place. On the contrary: the new proposals show defects of the “old” organization, and failure to learn.

¹³² The original of this informal report of the meeting is part of the file with the correspondence about the IBG PC2009.

¹³³ The text can be found in the file under 20090929 in the directory Renewal.

- temporize them;
- It is sensible that in the future IAG wants to adopt ambitions for change only if it is ready for them. Therefore IAG should give high priority to assembling sufficient knowledge and know how in the organization. The organization culture and the relation with the ministry should be sufficiently grown up to support the changes;
- Because of possible changes in regulation due to budget cuts it is good that at this stage no energy is spent on major changes of [hard and software] systems which may have to be changed in the near future to accommodate changes in regulation;
- It is good that IAG proposes to look forward at the consequences of possible changes in regulation together with the ministry;
- In the coming 5-7 years IAG will remain using the present systems. They should be optimized to be able to accommodate new policies and regulation. Without optimization the system changes for new policies and regulation will become ever more costly;
- IAG announced that in the coming 2 years new functionalities will be added to the present systems. It is important to indicate that new functionalities should only be added if they are 1) manageable; 2) compatible with expected changes in regulation.

In a general sense we can note (contribution Van Velsen):

1. The proposed 3-track approach is OK.¹³⁴
2. The tracks should be elaborated in long term plans.
3. The plans should be evaluated by external experts, such as from Ernst & Young. The experts should report to the ministry.
4. The implementation of the plans should be evaluated yearly by the same experts.
5. With respect to the organization development: NEA should learn to communicate better with the ministry¹³⁵ about plans and investments, in a way which is understandable for its partners. The ministry should be able to understand what it approves».

At least 3 and 4 were ignored.

Note that the assertion that a Renewal plan was/ is not necessary, and that IAG can go on working with the present systems for years to come is not compatible with the arguments used to substantiate the budget of 45-55 M€ in 2005-2006, and with the observation of 2009 of the audit department that “The present systems of IAG are not very well suited for flexible and fast information retrieval. The architecture of the systems is badly outdated, and basic data are stored in different systems. This creates the risk of inconsistency. Information is mostly obtained by writing easytrieves and queries. The problem has been tackled in the Renewal program”.¹³⁶

The three-track approach (30 September 2009).

The presentation of IAG for the SG on 30/9/09 proposes the following 3-track approach:¹³⁷

«Track 1: Safeguard the continuity of the present production processes;

Track 2: Together (ministry and NEA) towards a new political/ regulatory system for study financing. [Outline of the new system, to be implemented 1/1/13].

Track 3: In the short term, 1-2 years, work on ordering conditions for successful innovation, coupled to merger trajectory NEA».

¹³⁴ For a specification of the 3-track approach see the following section.

¹³⁵ Formally, since NEA has formally become part of the ministry: the complement of NEA in the ministry.

¹³⁶ Of course, it would be unwise to believe the audit department blindly. The chapters 2-5 contain too many examples of its unreliability. Furthermore, it is highly improbable that a renewal program of 55 M€ is necessary to solve this problem.

¹³⁷ The presentation can be found in the directory Renewal, under 20090930. The three tracks are described on sheets 13-15.

The last should include “people and organization”.

No report or minutes of the meeting of 30/9/09 could be found. The sequel implies that it was decided to write a memorandum for the MTM of 26/10/09.

Memorandum for decision making by MTM.

The (extensive¹³⁸) memorandum is entitled “Together towards a new perspective for study financing”.¹³⁹ It has the following table of contents:

1. Executive summary
2. Motivation and terms of reference
3. What are the results of the Renewal plan up to now?
4. How the Renewal plan got stuck: an analysis
5. Developments in context
6. Boundary conditions
7. Approach and timelines.

The contents looks similar to that of the presentation of IAG at 30/9/09. The following is from the executive summary:

«1.1 Introduction

In 2006 IAG began with a major renewal program to improve the processes of study financing. In April 2009 the SG has asked IAG to study further possibilities of downsizing the scope of the program in order to reduce risks. On the basis of an analysis it was decided in June to pause the part of the program concerning study financing. There was insufficient perspective of realization of the original goals within the framework of the available time and money. In July-September IAG made a deeper analysis and developed the outline of a plan for a sequel of the renewal plan.

1.2 Most important results of the analysis

[...] The analysis confirmed the picture of the memorandum *Realistic renewal* of the management team NEA of June 2009.¹⁴⁰ The most important conclusion is that at this moment, IAG is not able to execute a sizable renewal program of study financing successfully simultaneously with the regular processes for study financing. Conditions regarding management, culture, know how and cooperation are not fulfilled. In addition there was a lack of acuity and real cooperation of ministry and IAG along the axis of development and implementation of new regulation and management of complexity. Finally it turned out that the present system landscape is good enough for another 5-7 years if some technical and functional improvements are made timely. With the understanding that the present system landscape cannot cope with new major changes in the regulatory regime».

The conclusion that “at this moment, IAG is not able to execute a sizable renewal program” is the same as that drawn by minister Hermans 9 years before, and quoted in the beginning of this chapter:¹⁴¹ «Experience has shown that the alternative [to gradual system renewal], simultaneous replacement of existing systems by an integral new system is not feasible». Clearly, the promise of gradual renewal has not been kept. Instead, IAG and ministry repeated the history of the failed Redesign project. Parliamentary, DGAO and other forms of control were non existent or did not work, and the taxpayer has been swindled.

The following is said about organization development:

«*Track 3: Organization development NEA*

In the short term an effort will be made to satisfy the conditions for successful innovation, coupled

¹³⁸ 15 pages, 5800 words.

¹³⁹ It can be found in the directory Renewal, under 20091026.

¹⁴⁰ It can be found in the directory Renewal, under 20090617.

¹⁴¹ Hermans’ letter was dated 20/12/00. The earlier quotes can be found by searching for “hermans”.

with the fusion trajectory NEA. This track therefore supports tracks 1 and 2. Important fields of attention are organization development (culture, management, people) and creating new élan. The development will expressly build further on the changes in the cooperation ministry-NEA and the management of NEA by the ministry which are already set in motion.

The three tracks will be implemented simultaneously and coherently».

After a summary of the 3-track approach the minutes of the discussion of the memorandum in the MTM conclude as follows:

«One of the most important observations is that the present system landscape cannot cope with new sizable regulatory system changes. It is important that minister and policy departments are aware of this. For the investments which are necessary to ensure that the system landscape remains fit for a number of years of use a plan will be submitted to the SG [...]»

MTM will monitor progress on the three tracks in the NEA block».

Intermezzo: ConQuestor on inadequate management of IFC.

To show that not only IAG needs organization development, but IFC as well, some quotes are given from a ConQuestor report “Inquiry of the quality of the production processes of IFC” of 15/5/09.¹⁴²

In the paragraph “Observations” of section 4.5, “Culture”, one reads:

«In addition we note that it happens that the willingness of co-workers to actively cooperate depends on the person with whom they have to cooperate.¹⁴³

By failing to implement the O&F report¹⁴⁴ consequently and by leaving this situation unchanged, it is tacitly implied that an agreement need not be an agreement, that lack of clarity is permitted, and that management is not self-evident».

Section 5, “Conclusions”, includes the following:

«The education departments HE and PAE are vulnerable as regards personnel.¹⁴⁵ Often there are [only] one or few persons with the knowledge necessary for correct financing of the educational institutions. In addition the chain management in these sectors is less visible than in components.

The fields needing attention of IFC are:

- Limited chain management in IFC;
- Defective planning and control of the primary process;
- Absence of the ability to prove internal control;
- Defective sharing and safeguarding of knowledge;
- Insufficiently professional cooperation between contract management, the line, and ministry;
- The internal cooperation in the financing department».

On 17/8/09 the report was discussed in the MTM. The following is the relevant part of the minutes of this discussion:

«DGHPSE notes that a very important part of the budget [of the ministry] goes to the executive agencies, and that excellent quality control is therefore essential. If this requires deviation from government-wide norms, then that should be possible. uSG stresses that reflection on the regulatory framework of the agencies only makes sense if undertaken government-wide».

The top management of the ministry has spoken. And decided/ done nothing.

It is evident that in the merger of IAG and IFC, IFC cannot serve as an example for IAG.

¹⁴² It can be found in the directory Renewal, under 20090515.

¹⁴³ The original Dutch is just as cumbersome.

¹⁴⁴ This refers to an earlier report on a redesign of organization and formation.

¹⁴⁵ The report does not explicitly say that this refers to IFC-departments. If the remarks concern the departments of the ministry, that should have been said explicitly, since the review concerns IFC, and not the ministry.

The management agreement Ministry-IAG 2010.

On 17/12/09 SG Van der Steenhoven and DGNEA Kerstens signed the management agreement ministry-NEA for 2010 (MA 2010).¹⁴⁶ With respect to the sequel of the Renewal program it gives some important numbers. Apart from that it leaves much clarity to be desired.

On p. 3 one reads:

«Of course most attention has been given to continuation and improvement of the delivery of products and services. In 2009 this required sharp balancing acts for several dossiers. For example, it was decided to stop the renewal plan for study financing».

P. 59, in appendix J, presents a table “Projects permitted to begin”. Among them:

«System renewal track 1: safeguarding, part 1 10,000

Tracks 2 and 3b: system renewal, part 1 2,500».

(The numbers 10,000 and 2,500 are hours, rated at 100 € an hour).

The table “Approved and advanced projects” on p. 22 mentions 40,000 hours (4 M€) for the “Sequel renewal plan/ necessary project”. The footnote on p. 24 asserts that this capacity

«is reserved for the implementation of:

1. Track 1: Investments to safeguard and stabilize the present processes (2010-2012).
2. Track 2: Together (ministry & NEA) towards a new regulatory system for study financing (2010-2013).
3. Track 3: Organization development NEA (2010-2012)».

P. 7 specifies organization development in terms of the following components:

- «completion of the merger
- further development of the organization
- quality and efficiency of the organization
- satisfaction of the employees».

Neither in this connection nor in the elaboration in appendix E of the MA reference is made to the experiences with Redesign, Renewal, or the ConQuestor report. Nothing suggests that there is a big problem that has to be solved. To wit, the problem that NEA doesn't know what it can and can not, and lacks the ability to learn and correct itself. The MA seems to bring the problem a step closer to oblivion. And repetition of the failures of Redesign and Renewal a step closer.

Renewal not mentioned in risky-projects report for last quarter of 2009.

The report about risky projects in the last quarter of 2009 makes no mention of the Renewal program or a sequel.¹⁴⁷

2010.

An enterprise plan.

On 11/2/10 NEA submits a “definitive draft” of its enterprise plan.¹⁴⁸ Section 6.3 of the plan describes by what activities NEA will try to make sure that its strategic goals for 2015 will be realized. One of them is the

«*Strengthening of leadership, culture and communication*

¹⁴⁶ It can be found in the directory Project management, under 20091217.

¹⁴⁷ The report can be found under 20100118 in the directory Project management\Project reports.

¹⁴⁸ It can be found in the directory Renewal, under 20100211. The “enterprise plan” is something new, first mentioned in MA 2010. The name is remarkable because “enterprise” suggests independence if not private. But IAG was much more independent than NEA. NEA is just one of the directorates-general. It has no exceptional legal status (any more).

NEA starts a process of culture change. The implementation of mission, vision, and strategic policy framework in a consequent way and according to a plan requires an intensive dialogue between management and employees, and an improved system of management and control. Some of the components of the adjustment process are: reduction of the number of mechanisms for control, switching to management on the basis of performance (thinking in terms of money), professionalizing the management of ICT and project management, investing in inspiring leadership, elimination of the island culture, central management of scarce resources such as analysis and development capacity, and improvement of accounting and management information about course, focus, and frameworks».

The enterprise plan gives no explanation. There is no reference to a plan for the culture change. It is not clear therefore how the plan will be realized, and how results will be measured and evaluated.

Chapter 8 of the plan lists the following priorities for 2010 and 2011:

- «Ordering the internal administration of NEA;
- completion of the merger;
- realization of a new office building in [the city of] Groningen;
- safeguarding the production agreements made with commissioners (ministries);
- safeguarding current development agreements made with commissioners (ministries);
- creation of room in finances and personnel by staff and line;
- Improving policy and implementation abilities of HRM¹⁴⁹».

Somewhat lower on the same page it is confirmed that the Renewal program has been stopped.

For example section 8.6 mentions a program organization development, but the enterprise plan gives no specification of the program. And the actual contents of the enterprise plan, such as the priorities just quoted, is hard to reconcile with a program of organization development directed at the realization of an organization which can learn and correct itself, adjust to changing circumstances, and work permanently on more effective and efficient production.

The enterprise plan was discussed in the MTM of 15/2/10. The minutes don't say that MTM approved the plan, even though DGNEA had asked for "commitment". The atmosphere of the meeting is characterized by the following paragraph:

«The members of the MTM ask attention for the implementation trajectory of this enterprise plan, the investments it requires, and future budget reductions. DGNEA stresses that this plan is exactly meant to offer a perspective for an efficient and effective future of NEA».

The risky-projects report for the first quarter of 2010.

Among the documents for the NEA block of the MTM of 19/4/10 there is a report about the progress of the risky projects in the first quarter of 2010.¹⁵⁰ "System renewal study financing" is one of them. The state of affairs of the tracks mentioned earlier is characterized as follows:

«Track 1: Started. Parts 1 and 2 (2010) are running or will be started. Preliminary inquiries for parts 3 and 4 (2011) will be made in 2010, first of these inquiries started;

Track 2: In preparatory phase;

Track 3: In preparatory phase».

The following is reported about the progress:

«The first two parts (cleaning, processing income data internal revenue service) of track 1 have been taken in production».

This suggest that the project is a dumping place of odd jobs.

At the end of the report there is a

«Remark/advice of the departments of Information policy (IP) and Finance (of the ministry):

- Further elaboration of the costs/ investments per track is very important. According to the definition of parliament, this may be a "big project". This would imply a duty to report to

¹⁴⁹ That is: the department of human resources management.

¹⁵⁰ It can be found in the directory Project reports, under 20100414.

parliament according to their particular system. This should be taken into account from the very beginning of the project;

- The ministry does not seem to act as commissioner of the program. This is an undesirable situation, for example because of the size of the project and the capacity it requires of NEA [and the possibility of interference with going concern];
- Because of the limited background information about, and involvement with, the project, the CIO¹⁵¹ cannot at present fulfill his i-control and advisory role adequately;

IP will try to take action on the above points in collaboration with HE and NEA».

MTM discusses the NEA report for April 2010.

On 31/5/10 the monthly progress report of NEA about April 2010 is on the agenda of the MTM. Section 7 of the report describes the “Progress organization development NEA”. The following is the unabridged text of this section.¹⁵²

«7.1.1 Enterprise plan

For the realization of the enterprise plan talks are being held along different channels with the employees. The plan is explained and discussed. There are walk-in sessions with the top management, where employees can speak directly with members of the top of NEA. The talks explore the direction indicated by the enterprise plan. The top uses the output of the talks as input for the organization development trajectory. In this trajectory the goals of the enterprise plan are elaborated in development nuclei, for example.

7.1.2 Organization development NEA

The start of this trajectory is the first step in the elaboration of the enterprise plan and the implementation of the downsizing.¹⁵³ In seven development nuclei people are working on an organization which works better but also cheaper. Does more with less. The seven main areas or development nuclei of organization development are: study financing, information products, examination services, financing institutions, staff and support, basic registers, and development. In each area a team begins with a quick but thorough analysis of processes. To see where “profits” can be made. How can processes be made faster, better and cheaper? With fewer rules or procedures? Questions about digitizing or “sourcing” are discussed as well. Until the end of April work is directed at an integrated improvement plan for all development nuclei. Half May this plan will be submitted to the SG. After approval realization can begin. Organization development will then become a continuous process in NEA to realize the enterprise plan».¹⁵⁴

The causes of the crash of the Renewal program and the goal of organization development which was set in the last months of 2009 seem to be completely forgotten. There is not the least chance that the approach sketched in 7.1.2 will result in an organization which can learn and correct itself, adjust to changing circumstances, and work permanently on more effective and efficient production. The minutes of the MTM of 31/5/10 nevertheless say nothing about this section 7.

SG orders NEA to investigate how system changes can best be realized.

In a letter of 16/7/10 the SG requests DGNEA to make a preliminary inquiry for system renewal. The letter opens as follows:

«In the reconsideration report¹⁵⁵ “To study is to invest”¹⁵⁶ it is noted that the information systems of NEA for awarding study financing and collecting study debts have become vulnerable. I share this

¹⁵¹ The chief information officer, prescribed by DGAO, see chapter 3.

¹⁵² That is: of section 7. Even though the numbering may suggest otherwise.

¹⁵³ The downsizing is an operation meant to reduce the number of employees.

¹⁵⁴ The report is included in the directory Renewal, under 20100511.

¹⁵⁵ “Reconsideration” is one more word to denote measures related to budget cuts and downsizing.

¹⁵⁶ In the directory Renewal, under 20100401.

conclusion. The heart of the information systems has not changed since the eighties. As a consequence, the pressure on production is steadily increasing, service cannot keep up with the times, and the costs of the implementation of policy changes are becoming higher and higher».

This is an example of misleading by half-truths. The first sentence is remarkable and questionable: at the end of 2009 both Ernst & Young and IAG had concluded that the system can remain in use for another 5-7 years, unless regulation changes radically.¹⁵⁷ The SG does not explain the fact that the system has not been thoroughly renewed¹⁵⁸ since the eighties: that renewal has been tried twice. It failed both times, at a total cost of more than 70 M€. That the failure was due to 1001 defects in IAG, and that there is no evidence that the defects have been repaired. No mention is made of the conclusion of Ernst & Young, that NEA can only be expected to successfully complete big projects after a thorough learning and development process. In short: that even if system renewal is necessary, NEA cannot realize it.

By failing to mention two failed major upgrading programs the SG gives an uninformed reader the impression that this is the first time in almost 30 years that the idea of upgrading is raised. In this way inviting the reader to admit that it is high time to do so. And of course, to approve the spending of large amounts of money on this. The text of the SG is entirely misleading everyone who starts reading at this point.

The paragraph with the actual request (formally: order) is the following:

«Because of the importance of the project I hereby order you separately to start a preliminary phase to investigate how the system changes can best be realized. For that reason I would like to receive from you on the short term a plan sketching the preliminary inquiry, what the results of the inquiry are, and for what investment costs it is made, including substantiation. As final product of the preliminary phase I would like to receive half November 2010 a quote with an extensive project planning for the system renewal».¹⁵⁹

In this letter SG Van der Steenhoven asks NEA to do something he knows it cannot do (properly). Because of the experiences and evaluations of the past 10 years the new project must be expected to cause big losses, and much more costs than benefits. Integrity would be the first victim if it hadn't already been sacrificed long ago.

As in the PPP the past is simply ignored, “forgotten”. It isn’t mentioned any more. The documentary evidence is made to suggest that history starts with this document. The letter just quoted is a perfect example: “The heart of the information systems is not changed since the eighties”. This is how historical failures are repeated.

System renewal is said to be necessary anyway, and to cost 75 M€.

According to the report about risky projects for the second quarter of 2010 track 2 will cost approximately 75 M€¹⁶⁰. The report “To study is to invest” is mentioned as the source of this number. The letter of the SG shows that this 75 M€ cannot be more than a wild guess. This conclusion is confirmed, or rather amplified, by the observation that the reference to “To study is to invest” is a trick similar to that of Van Spijker in the history of the PPP: a reference to an “independent” external report that actually quotes one’s own opinion.¹⁶¹ In this case the 75 M€ is an “estimate” of IAG.¹⁶²

In bold type the report about risky projects claims:

«It is important to realize that system renewal is necessary, irrespective of regulatory system changes».

¹⁵⁷ Why does the SG only mention the reconsideration report, and not that of Ernst & Young?

¹⁵⁸ There actually were uncountable changes (updates): see the 4-monthly reports of IAG about the implementation of the performance contracts, under system development.

¹⁵⁹ The rambling is intentional, and part of the effort to remain as close as possible to the original. Clarification would be debatable, for example because it would require choices to resolve ambiguities.

¹⁶⁰ Seventy five million euro.

¹⁶¹ See p. 51 of “To study is to invest”.

¹⁶² 75= three times 25 for each of the years 2011, 2012 and 2013. See p. 51. A similar table was presented at the beginning of the Renewal program. See the dossier.

The sentence preceding this bold one, «During the formation of a new cabinet it will become clear how much money has been made available for the operation», suggests that what is going on is an effort to gather in (“earn”) money in the context of the formation of a new cabinet. In this context ministries are used to submit lists of niceties they would like to get extra money for.

The second part of the bold sentence, “**irrespective of regulatory system changes**”, lacks substantiation. It is incompatible with the conclusions of the end of 2009.¹⁶³

The report about risky projects was discussed in the MTM of 30/8/10. According to the minutes:

«DGHPSE expresses worries about track 2 of the project System renewal. The project is expected to cost 75 M€, and this money is not available. A scenario should be developed to solve this problem. SG and DGNEA answer that much depends on the new cabinet agreement. If the regulatory system doesn't change, it is improbable that the 75 M€ will be made available.¹⁶⁴ DGHPSE reads the bold sentence aloud. It is decided that the deficit should be put on the agenda of the constituting convention [of the new cabinet]. uSG will contact the finance department about this».

DGHPSE seems to think that the bold sentence is true. The project is supposed to have a value of 75 M€. If this is spent in three years, about 25% of the employees of IAG will be working full time on the project. External people will be hired as well, and there are material costs, but the comparison clearly says much about the relative size and impact of the project.¹⁶⁵

DGHPSE works already more than 10 years at the ministry. He knows from experience that the reports of NEA are unreliable. He knows that a similar project was shipwrecked less than a year ago. And so on. In short: he should and could know that even if system renewal is necessary, NEA cannot realize it. (Of course, SG and DGNEA could and should know even better).

Only money is taken seriously and gets real attention of the top.

One of the last documents in the dossier for this chapter is the offer sent by NEA to acting SG Roborgh in reply to the letter of the SG of 16/7/10.¹⁶⁶ (SG Van der Steenhoven had left the ministry. His place was temporarily filled by DGHPSE Roborgh). The offer gives the names of the people responsible for 8 of 9 inquiry teams. The person who is to be responsible for the team “organization and competencies” is still unknown. The offer is dated 22/9/10.

On the same day there was a meeting of Roborgh, Kerstens, Smit and others about the (new) project system renewal. The participants agreed that the project should start as soon as possible. Independent of the results of the inquiries. In particular independent of the inquiry “organization and competencies”. While it is evident that reparation of the many defects identified as causes of the failure of the Renewal program is a matter of years.

That getting and spending the 75 M€ is the top priority is confirmed by the report about the risky projects in the first quarter of 2011.¹⁶⁷ Nothing has been learnt, but the third system renewal project has begun all the same.

¹⁶³ This shows one of the mechanisms for ever increasing taxes and government expenditures, and the absence of pressure to account properly and make activities more efficient.

¹⁶⁴ Note that this shows a mechanism where the wish to increase a budget creates an interest in the change of laws.

¹⁶⁵ It is far bigger than Renewal, which had a budget of 55 M€ for 5 years...

¹⁶⁶ It can be found in the directory Renewal, under 20100922.

¹⁶⁷ The report can be found in the directory Project reports, under 20110426.

Chapter 6.

Analysis of the chapters 2-5 as regards the internal operation of hierarchical organizations.

Table of contents of this chapter.

1. Introduction. Historical-methodological remark.
2. General conclusions from the chapters 2-5.
3. Explanatory analyses and remarks.
4. General causes of false pretensions in government.
5. Pointwise explanation of the observations.
6. Why conventional solutions won't work.
7. Conditions for honorable government.

6.1. Introduction. Historical-methodological remark.

The first version of this chapter was written immediately after completion of chapter 5. In the summer of 2011 at the latest. The plan was to analyze the chapters 2-5 before starting a study of cases in the world outside the Dutch education ministry. Especially some well-known whistleblower cases and the financial crises. The idea was to use the other cases to test the conclusions of chapters 2-5. The other cases were also studied (and selected) in the hope that they would show more of the (political) heads of the organizations who play key roles in the cases. Apart from the case Spijkers, the other cases, including the financial crises, were studied only after the summer of 2011. Though some things about them were already superficially known from the daily news.

The analysis of this chapter was primarily made to see and show what can already be inferred from the chapters 2-5 alone. Far too often, available information is badly underused. Much time and money, and many discussions, are wasted in gathering additional information which for practical purposes is unnecessary or of very little additional value. In general, the available information shows and implies very much more than people realize. Implications simply are not seen. This can be blamed on inadequate or absent reflection and analysis. Including the failure to combine seemingly separate fragments of information, and the failure to identify and ask relevant questions. As a consequence, many more answers lie hidden in the available information than are retrieved. At great cost to humanity. In practice, it often seems easier (or more convenient) to collect more information than to conduct a more thorough analysis, or to say aloud what the facts clearly show. This applies especially when analysis is felt or feared to lead to results which may cause difficulties of one kind or another. The need to revise one's world view being among them.

To show how much can be derived from the open study of just one ministry, this chapter has been edited only slightly after the study of the other cases. No really new elements have been added. In fact, with the exception of the case of Van Buitenen, the other cases give only little explicit information about the internal operation of hierarchical organizations.¹ And what they tell about it either confirms the analyses or can just as well be dealt with in chapter 9.

On the other hand, the analyses and conclusions of this chapter play an essential role in the understanding and interpretation of all of the following cases (in the chapters 7 and 8). Most of those cases are inexplicable if important conclusions of the present chapter were substantially incorrect. That is: if the organizations concerned worked properly. In accordance with widely accepted norms and their own codes of conduct.

¹ "Explicit information": to be distinguished from implicit information, such as implied by the lack of whistleblowers in cases of gross malfunctioning, and the repetition of similar failures.

6.2. General conclusions from the chapters 2-5.

Introduction about generalization and the exception-hypothesis.

“General conclusions” are understood to be conclusions which are not case-specific. A general conclusion may be hardly more than a factual observation, inferred from a set of facts. It is not a description of a specific fact. The general conclusions include “necessary implications”: assertions which must be true to make phenomena possible or explainable. The same argument may also justify a generalization. Though obviously not all generalizations can be justified in this manner. In the present context, generalization may also be justified by variants of the following grounds:

- There is no evidence supporting the hypothesis that a phenomenon, such as shown in the policy portal project, is exceptional. On the other hand, there are sound reasons for assuming that they are representative;
- The other projects were studied in order to find out whether the policy portal is an exception. The result of the study was: no, the gross misconduct characterizing the policy portal project is not the exception but the rule.

Analysis (reflection) furthermore shows that the causal phenomena cannot be exceptions. They don't have specific or incidental but structural causes.

That not many more cases are known is easily understood. The chapters 2-5 themselves provide at least part of the explanation. These chapters and the present one show that whistleblowing produces very little or nothing positive, but may easily ruin the life of the whistleblower. Whistleblowers show that politicians resort to terrorism, and condone this kind of terrorism by their colleagues. (Or even collaborate).² This kind of terror always goes unpunished. As a consequence one needs to think twice before blowing a whistle. Indeed, the chapters 7 and 8 show many cases where a whistle could and should have been blown, but wasn't. Governmental terror is effective. That cases are easily forgotten, and therefore seen as incidental instead of structural, is explained just as easily. For it is in the nature of journalism to travel with time: to see only today, and to forget the past. That is: it is in the nature of journalism not to integrate newly acquired information in the body of knowledge already acquired. Its almost exclusive attention to the news of today is equivalent with actively making people forget what happened yesterday and before.

General conclusions from the reports in the chapters 2-5 and miscellaneous analytical remarks.

Some conclusions can be formulated rather concisely. The following is a list of phenomena which characterize the projects described in the chapters 2-5. Because of the nature of these phenomena, they must have an all-pervading influence on the organization as a whole. The listing gives priority to clarity and explicitness. Some of the points overlap, are partially equivalent, or are implied by some of the others.

1. Essential false pretensions of the top. The general nature of these pretensions is: claiming to be, or do, something one is not or can not. The cases show false pretensions in almost every field of importance. Not only in technical fields like information technology, but also in integrity, inquiry and (project) management. The false pretensions cause structural failure.
2. The false pretensions are combined with the absolute refusal to admit them (or any important error). Errors are not acknowledged but denied and/or hidden. As a consequence they are not a marginal affair, but dominate the dynamics of all cases. The false pretensions generate more misconduct if employees try to correct something.
3. Irresponsible behavior, especially of the top. For example by approving something without understanding, disregarding experience, or against better judgment.
4. Harming people of whom one knows that they do their duty, and that they refuse to collaborate with misconduct.

² As in the case of Edward Snowden.

5. Rewarding people of whom one knows that they did not do their duty, failed grossly and avoidably, are not competent to do their duty, or falsely pretend that everything goes fine.
6. Incorrect and misleading reporting, usually too rosy. Failure and causes of failure are not mentioned or lied about, making remedying difficult or impossible.
7. This also applies to inquiry institutions like the Dutch General accounting office (DGAO) and the audit department of the ministry.
8. Structural violation of the code of conduct by the management.
9. Violation of professional norms, including forgery, by employees of the audit department.
10. The top acts as if it has nothing to fear from parliament or any other form of supervision or control. Nothing in the projects described in the chapters 2-5 betrays the existence of control/audit organizations like parliament and the DGAO, or the following stipulation from the Dutch General Civil Servants Regulation : «**The civil servant should fulfill the duties which are implied by his function meticulously, and behave as is proper for a good civil servant.**»

Other conclusions need some more words and discussion.

The conduct of the top is incompatible with its words. Many employees participate more or less actively in misconduct. Almost nobody tries to fight it. If an appeal is made to integrity officers in cases where the top is actively involved, integrity officers back down, don't show up, or become ineffective in another way.

Considered separately, the “imperfections” may not seem to be very harmful. Indeed, if they are incidental and uncorrelated, “human weaknesses” or errors need not cause a lot of harm. The problem is the structural character of the “errors”- which is correlated with resistance against correction- in combination with the influence and responsibility of the positions of the officers concerned. The deficiencies add up to complete corruption. Where “corruption” is defined as any form of systematic inappropriate behavior, and/or lack of integrity. As opposed to accidental transgressions. Corruption means the subordination of norms and values necessary for the proper fulfillment of a function or duty to other, incompatible norms and values. Corruption arises if priority is given to maintaining and improving the (power) position of individuals who do not and cannot do what they claim and should do. In the present report, corruption only refers to situations where the operation of the organization is dominated by norms and values which are incompatible with the norms and values which are publicly professed. They are publicly professed because they are considered desirable and/or normal by the public, and because support of the public is considered necessary or desirable. The organization is dominated by inappropriate norms and values if the operation or products of the organization are seriously affected. Corruption need not mean that every employee is corrupted. Neither does it mean that the organization does not produce anything useful.

Both inwards and outwards the top of the ministry of education broadcasts that the ministry works according to professional and integrity norms. This can be interpreted as part of image building. The image is false however. The author has personally informed the secretary-general and the under secretary-general about the misconduct described in chapter 2, and about its structural character. The secretaries reacted with temporization tricks, and efforts at misleading, concealment and repression. Not with correction. The foremost mismanagers (liars) were even promoted. Not integrity, but dirty hands seem to be conditional for promotion. On the other hand, someone who tries too seriously to stop misconduct, and does not accept the fairy tales of the management, is sidetracked.

The whistleblower histories presented in chapter 8 clearly show how other government organizations dealt and deal with criticism of misconduct. The common denominator of the histories is: the whistleblower was right, but suffers very badly and irreparably, and nothing is done with respect to those who necessitated whistleblowing, and to those who terrorized and harmed the whistleblower. In general it even remains unclear whether anything effective has been done at all to

prevent repetition of the phenomena which gave rise to the whistleblowing. In this respect too, supervision fails completely.^{3,4}

When considered in combination with the reports of the chapters 2-5 and the analyses given in the present chapter, the whistleblower cases strongly suggest that the reprehensible phenomena seen in the education ministry are not exceptional, but representative of (at least) government organizations.

If a higher goal existed, the top of the education ministry had lots of possibilities for explaining that the observed misconduct served that higher goal. It could have indicated the higher goal. It never used these possibilities. Therefore, and because there is no indication of a higher goal whatsoever, it has to be assumed that it simply does not exist. Or that it is indefensible. Such as self-interest and/or the interest of the political establishment.

The conclusion is that the top misleads, covers misconduct, and obstructs efforts directed at correction for no defensible reason. The top is an integral part of the problem.

The misconduct of the management seriously harms relatively honorable and competent people. It harms people who want to work in accordance with norms and values which the population considers desirable or necessary. Norms and values which are publicly professed by SG and uSG and other top government officials, such as Van Es of the ministry of internal affairs.⁵

In practice however, government officials give overriding priority to keeping up appearances. They seem to think that this is the only way to keep the house of cards from falling apart. They seem to think that real respect, integrity and transparency would be fatal for the public image of themselves and their organization. Competence is of secondary importance. Obviously such an attitude is equivalent with corruption.

The cases show considerable avoidable waste of taxpayer's money. The percentage is not small. If the reports are representative, then the percentage is closer to 90% than 50%. The 90% applies in any case to the category "projects". This is not to say that the situation can be compared with a rotten tree never producing healthy fruit. The management is not the productive part of the organization, and for that reason the comparison with a fruit tree does not hold. A rotten management does not exclude the possibility of competent subordinates. Still, incompetent management inevitably affects appointments, and very much else in an organization. With an incompetent management it is logically impossible that the efficiency of any activity is high. Quality control cannot be adequate, since those responsible are neither honorable nor competent, and do not want this to be exposed. Correction, improvement and optimization require competence.

Incompetence also affects policy development. If one considers the long term,⁶ it is obvious that policy development has nothing to do with improvement.⁷ It is the product of the pretensions and self-assertion of the political heads of the ministries. They want a place in history as authors of great improvements, even if their realization requires nullifying the supposedly great improvements of their predecessors.

³ The lack of measures against those who were responsible for the misconduct discovered by the whistleblowers, and the way those responsible were (and are) treated by politicians in power is even more telling than the misconduct initially exposed. After all, such a lack can only be understood if the misconduct is not incidental but structural, and if politicians want to keep this fact hidden at all costs. If it were incidental, there would be no reason for any irritation: errors are indeed human, and can often be corrected easily (not always!).

⁴ The supervisors include (general) accounting offices. Their legal duties, mission statements, etcetera, require them to promote integrity, efficiency and true (instead of only verbal) respect for other generally accepted values in government. That is: they should make sure that government organizations work in a way that makes whistleblowing unnecessary, and allow for true transparency.

⁵ See chapter 4 on integrity in Dutch public administration.

⁶ Say 50 years or more.

⁷ Or adjustment to changed social or economic circumstances. As distinct from changes in politics. For indeed, some changes are necessary to correct harmful consequences of policy errors in the past. But efforts at correction usually introduce new undesired effects. This is what incompetence breeds in practice.

In so far as legal prescriptions and policy rules require an honorable and professional public administration, in short: if they require acting responsibly, then there is gross structural violation of legal prescriptions and policy rules.

The ministry of education is a world onto itself. The influence of the outside world on its operation and activities is strongly filtered and very limited. Parliament only communicates with the minister. Reports of the General accounting office and others are only used if they fit a preconceived mental framework. Otherwise they are not considered politically relevant, and simply ignored. Nobody calls civil servants or the organization to account. Neither the members of parliament of the coalition in power, nor those of the so-called opposition.

The conduct of the top of the education ministry clearly shows that it doesn't want its failures and violations of the code of conduct to become public. The top furthermore assumes that lies and repression of internal criticism are all that is required. It does nothing to avoid past mistakes and errors, and doesn't change its ways. There is no indication that it is afraid of having ever to account for this, or that its misconduct will be found out and made public by say the General accounting office.

How the minister and ministry of education, and parliament manage reactions to publicity about a failure is shown by the letter about the project Redesign of minister Hermans to parliament.⁸ Parliament is fobbed off with fair words and promises. Parliament accepts them. It doesn't check whether the promises are made good, and whether they have the required effects.⁹ In the case considered, the promises were no more than paper. Nothing changed. With the logical consequence that a repeat project some years later, a project similar to the Redesign project, failed completely.¹⁰

A large majority of employees conform themselves to what they suppose the management expects of them. They behave as instruments of their superiors. Obedience and adaptation are given top priority, integrity and professionalism are subordinated.

A minority nevertheless keeps on trying to work according to generally acknowledged integrity and professional norms. A smaller minority even tries to promote wider respect for these norms in the organization. None of these people has a management job however, and their success is limited at best. Maybe they prevent or retard worsening.

The inquiries into the execution of projects and the functioning of organization units by audit services and consultancy firms are almost always fatally flawed. Both with respect to integrity and method. Often the reports are misleading (in a practically relevant sense). For example by leaving important problems unmentioned, or by implicitly suggesting that problems are less serious than they really are.^{11, 12} It is as if professional codes don't exist.

As examples of methodological errors can be mentioned:

⁸ For an excerpt see chapter 5.

⁹ As in the case of many if not all other inquiry reports. See chapters 7 and 8. There is no exception. This is not particularly amazing, for if monitoring would be seen as important, it would be a routine practice.

¹⁰ Until 2015 the then ex-minister Hermans had influential roles in public administration. In 2015 however he was unmasked, and gave up his political jobs. A judge ruled that he had utterly failed his duties as supervisor of care provider Maevita. See *Hermans (VVD) stopt als senator na uitspraak rechter*, NOS.nl 2/11/15. It can be found in the dossier for this chapter under 20151102. Hermans was nevertheless expressly invited to attend the opening of the Dutch parliamentary year in September 2019.

¹¹ A good example is the report *Stand van zaken integriteitszorg Rijk 2009* (State of affairs integrity care government 2009) of the Dutch General accounting office of March 2010. It was discussed in chapter 4, and can be found in the directory Integrity. (More examples can be found in the chapters 7 and 8).

¹² There is moreover an important bias, namely that some inquiries are only made when a preliminary investigation shows that the results of a full inquiry will be reasonably positive. As a consequence of this bias the picture arising from the set of published reports is too positive. This note is based on oral communication with an employee of a consultancy firm.

- lack of clarity about the scope and limitations of the inquiry and the reach of its recommendations;¹³
- (uncritical) use of interviews as an important source of information, especially the use of interviews with persons whose functioning is to be evaluated, and who have an interest in specific outcomes;
- inconsistency, especially between the “executive summary” and the rest of the report. It may arise under the influence of discussions of the draft report with a client who only reads the executive summary.

The reports show that no positive lessons are learnt from experience and inquiry reports, and that no attention is paid to relevant knowledge about for example project management and ICT projects. Where positive lessons are defined as lessons which help prevent repetition. As opposed to negative lessons which help keeping misconduct and failure secret, or make misconduct less risky for the top. There is some marginal supervision in this respect, but the relevant reports lack insight and openness, are easily ignored, and have no positive effect.

A minister is the head of his ministry, and the only person in a ministry who can be demanded by parliament to account for whatever has been done or omitted by his ministry, its dependent agencies, and any of his employees. At the same time he is invisible in all of the projects described, and in the project management. In fact, there is no indication of any form of supervision on the operation of his ministry by the minister. At least outside the domain of policy development, and as regards policy development only as regards contents.¹⁴ The above mentioned letter of minister Hermans to parliament is a case in point. The minister may have thought that his promises would be fulfilled of their own accord. He didn't check anything.

It is unclear why, given their CV's,¹⁵ members of the government would be able to select good top managers and/or other experts, either for their ministry or for other jobs. Nothing in the CV's shows any competence in this respect.

The education ministry can only be called a professional organization if professionalism allows unthinking approval (or rather praise) of, and obedience to, the requests of the head of the organization, and the neglect of all other (professional) norms and values.

A ministry could also be called professional if its overriding goal is keeping its minister and top managers in power, and if it successfully upholds or (re)creates a positive image of its top, itself and its work. However, this would mean that the set of norms and values of a ministry is inconsistent, and a guarantee (and explanation) of inefficiency.

Possibly the most essential instruments for the preservation of the corrupt state of an organization are the selection of new employees (including managers) by the sitting managers, and the transfer of employees from one position to another. When the top lacks integrity and/or competence, the condition that employees should not be able to endanger the sitting top has important consequences. In the situation of the education ministry, and many if not most other organizations, the condition means that the combination of integrity and abilities is at most acceptable far away from the top. Of course, such a policy impairs the quality and quantity of the products and/or services of the organization, and its efficiency and reliability.

¹³ With the scope of an inquiry is meant: the phenomena or objects of investigation. The reach of recommendations indicates the consequences of implementation of the recommendations. They may solve the problem, or contribute only marginally. Not every necessary improvement or correction is sufficient to solve the problems which prevent the realization of given goals. Sometimes the recommendations solve nothing at all, and seem to be meant only as window dressing. As in the reports of the independent experts in the case Van Buitenen, see chapter 8. In general, inquiry reports say simply nothing about these questions.

¹⁴ Not or rarely as regards the process for example.

¹⁵ CV= curriculum vitae: a concise description of life & career.

It is only logical that people for whom integrity and competence is a boundary condition, are prejudiced by people who allow themselves more degrees of freedom. For example by only taking self interest and self promotion as guiding values, and allowing themselves to play-act and lie as they deem fit. Members of the last group have an interest in helping one another. This gives them an advantage.¹⁶ The reason being that integrity strongly limits the extent to which honorable people can favor one another.

To prevent exposure of misconduct, honorable people must be kept out of a corrupt management. Even the top manager who once told the author what he really thought about the policy portal project did not act accordingly. And this was the only manager who ever was somewhat honest about any of the phenomena described in the chapters 2-5. During the lifetime of these projects honorable top managers had plenty of opportunities to speak up. But they didn't. None of the cases mentioned in this work shows support for the hypothesis of the existence of honorable top managers anywhere.

An important selection mechanism is the departure of people who are disappointed by what they saw and experienced in their organization. ("Voting with one's feet"). This mechanism increases the proportion of employees who are blind or (implicitly) approve of what they see and experience. It increases the complacency of the organization (= of the people who stay).

The education ministry does not have one (single) "organization culture". There is a subculture of the top management. It is characterized by deeds which are incompatible with its (public) words. In other words: it is characterized by play-acting. But this is not the rule in all of the ministry. A majority of the employees shares the norms and values of a majority of the population. However, hierarchical relations are accepted, and objections against the course of things are rarely raised. Objections almost never have the desired effect. Which amplifies the tendency of employees to keep their mouth shut. Those who don't are transferred to functions and places where they can do no harm. Or they are rendered harmless by other tricks.

In western societies it has already been recognized for centuries that law making, executive and judicial powers have to be separate and independent. But this insight has had no effect on the way organizations are organized and regulated. In organizations the three powers are not separate but united: in the top. This also applies to organizations which are supposed to comply with codes of conduct and professional codes. As a consequence the top can use or ignore codes at will. The reports of chapters 2-5 show that the primary function of the code of conduct of the education ministry is to create the appearance of integrity. The code is an instrument for propaganda. In the practice of the organization it may play a role in localized infringements of integrity. But it certainly plays no role where the quality of management is concerned. It is violated as a matter of fact. And violations are less reason for sanctioning than for promotion.

In the education ministry not only bad news is unwanted, but anything that is perceived as being inconvenient. Neither internally nor externally the neglect of seemingly reasonable advisory reports or recommendations is accounted for (in a credible, tenable way). Obviously this is only possible due to lack of effective control.

All mechanisms indicated in these conclusions are of a more or less fundamental nature. None of them is specific for the Dutch education ministry. No reference to education had to be made at all. The general validity applies in particular to the absence of effective preventive regulation and effective control. For this reason it has to be assumed that the phenomena which they produce are general too, and occur in at least all government and similar organizations.

All this in a democratic constitutional state, after more than 2000 years of Christianity.

¹⁶ "Together we are strong". Indeed, their kind governs the world.

Because of the lack of integrity and competence witnessed by the reports in the chapters 2-5, politicians and governments cannot be expected to be able to reliably solve the principal problems confronting countries and mankind. Such as those caused by man-made changes in the environment, by the coexistence of people with mutually hostile sets of norms and values, by armaments which can wipe out all life on earth in a single day, by uncontrolled technological developments, and by a infinitesimal level of international law and order.

6.3. Explanatory analyses and remarks.

Introduction.

The following analyses try to explain the events and conduct described in the chapters 2-5. They try to identify causes. The causes include circumstances and conditions which make the events and conduct possible or rewarding. The analyses are primarily concerned with causes and circumstances which are changeable. For both practical and theoretical reasons. The study wants to show how explanatory hypotheses can be tested, and to find measures for correction.

In spite of its length, the following note is only of marginal importance. The analyses contain a few remarks of a factual nature which supplement the reports. They are compatible with the reports, but not always substantiated sufficiently. This has several reasons. Such as missing documentation. Originally the study was limited to the policy portal project. The field of view was gradually widened. As a consequence, during the analysis it sometimes turned out that a specific document was no longer available or accessible. Sometimes something could be said on the basis of personal recollection. This could not always be verified with the available documents. In a few cases more substantiation could possibly be provided. But the added value this would provide did not seem to warrant the costs in terms of time and effort. And in most cases it is obvious that the opposite of a remark is incompatible with the evidence.

Why the top doesn't solve but hide problems.

The reports show that employees of the education ministry are very hesitant in forwarding bad news to their superiors. Often they say nothing, or give too rosy a picture.¹⁷ The hesitation is seen at every hierarchical level, making the hierarchical staircase an almost impassable filter. However high heads, directors, and directors-general may say to value openness and reliability: it is not visible in daily practice. Integrity clearly is not seen as a boundary condition.

Line managers dislike bad news. If they receive it nonetheless, they rarely take action.¹⁸ The SG and the uSG are no exceptions. The reports show that they force their subordinates to assume a similar attitude. Another attitude is sanctioned. When the author informed SG and uSG about the course of the policy portal project, they adopted an extremely closed attitude. There was no openness of any kind. They did not try to find the truth. (They probably already knew). They did not take corrective action. What they did try was to mislead the complainants into believing that the top would do whatever was necessary. At the same time, and by abusing their power, they (secretly) tried to construct a record showing that the complaints were unjustified and no further action necessary.

The development of the policy portals and the renewal project were stopped before the project goals came in sight. They were not stopped by the commissioner, but because they got stuck. No action was taken to prevent similar failures in other projects. Rather the opposite: those responsible for the failure were promoted, and not to a harmless, but to higher management position. Everything possible was done to make it appear as if nothing had gone wrong.

In the education ministry the aversion against forwarding bad news can be blamed on SG and uSG. By their treatment of messengers, a general lack of attention to reliable reporting, their denial of, or silence about, failures, and their exaggerated and unfounded optimism- as in the mail of SG after his

¹⁷ Just one more example of “a glass half full” from the policy portal project, from a draft report to a director general in 2006. It said: “Solution of this problem is being discussed”. It did not remark that the talks had been going on for several months already, and that no solution was anywhere in sight.

¹⁸ Except for inventing an argument that shows that it is not their responsibility to take action.

visit to IFC- they unambiguously broadcast that they don't want to hear about problems. Even though they say the opposite. In this climate, mismanagement and waste continue unabated. While it is evident that another attitude of especially SG would work miracles. In a hierarchical organization like the education ministry, the behavior of the top serves as an example and norm. It nullifies the code of conduct. By giving reliable information and advice an employee only makes sure that he will be side tracked.

The behavior of the top of the education ministry can be explained on the basis of the hypothesis that the highest goal of the top of the ministry is keeping up the appearance that the ministry works very well, and that it continues to improve itself. Everything that endangers the rosy picture is unwanted and repressed as much as possible.

This hypothesis explains why reliable and important but unpleasant information is kept under the table as much as possible. It may not explain the complete cover up and denial however, and the repressive attitude against the messengers. The top knows that the bad news is correct. The absence of an adequate reaction cannot be based on knowledge of good project management and progress. Because of the fact of the hierarchical organization it is impossible not to hold the SG and/or uSG responsible. The state of affairs and the course of events suggest much more strongly that the SG and uSG simply are unable to manage and deal adequately with the problems arising from their own false pretensions. The top seems unable to do its duty. To manage. In the sense of: doing what is necessary to make the organization, projects, etcetera work well, in accordance with integrity and professional norms. If they wanted to have projects executed properly, they appointed the wrong project managers.¹⁹ SG and uSG seem to work according to the biblical creation model. As if they were Gods. As if uttering a command is enough to have it executed perfectly. According to the creation story in the bible, God said: "Let there be light", and there was light. SG and uSG (and many other top officials!) seem to think that an organization works like that. That they need not do anything else. They never properly supervised any of the projects for which they were (directly) responsible. If they could do better, it was in their interest to do so, and to show that they could. To protect themselves against criticism. Keeping up appearances is nice, demonstrable success is even better. Real success reduces the risk of unmasking. But SG and uSG failed even to make minor corrections and improvements.

In the given circumstances the stubborn refusal to acknowledge problems can be explained from fear for a domino effect. The top may try to keep the door hermetically closed because it is very much afraid that it will burst open as soon as the latch is only slightly loosened. When one considers the course and findings of this rather limited study, in which every step revealed new problems, then one can conclude that this fear is more than justified. Probably the top knows better than anyone that lots of things are amiss. It may be aware of its own lack of management abilities, and that the only way to stay in (apparent) control is by denial and secrecy.

It may furthermore be difficult to appreciate critical comments if you are a blind optimist, or spend much of your time broadcasting a "positive", optimistic attitude, and explaining away or repressing everything that may be interpreted as pessimism.²⁰ It is anyway clear that the top of the education ministry feels that it cannot afford to be open.

The sketch of the attitude of the top is compatible with the observation that there are no real discussions. There is no openness and no tolerance. In internal conferences people remain silent because speaking makes no sense, or because remarks that can be interpreted as criticism may have negative consequences for the speaker. The reports show that contributing to important meetings is

¹⁹ Besides the projects mentioned in the chapters 2-5, important examples are the projects "Electronic accessibility" and "Edoc". There simply was no basis for the assumption that the appointed "managers" had the required competencies. It would have been a miracle if they had succeeded. (They did not).

²⁰ In this study, "critical" is understood to refer to using one's brain and capacity for thinking and applying common sense. In the digital edition of the Merriam-Webster 2002, one finds under "critical": «*syn critical, hypercritical, faultfinding, captious, carping, censorious* mean inclined to look for and point out faults and defects. *critical* may also imply an effort to see a thing clearly and truly in order to judge it fairly».

hindered by the late distribution of relevant documents, and by overcrowded agendas. Protests never had a lasting effect.

The answer to the title question of this section seems to be that the top is unable to solve the problems, and that the only alternative it sees is to hide them. Bad news means imperfect management and an imperfect organization, and that keeping up the appearance of perfect management and a perfect organization is an inviolable priority of the top. The top lacks the abilities necessary for proper fulfillment of its duties. It is unable to solve important problems. It can only keep up appearances by denial of deficiencies, and by repression of bad news.

It should be kept in mind that in general an explanation is not an excuse.

Disagreeable advice is ignored (and most advice is considered disagreeable).

From time to time authoritative organizations publish all kinds of inquiry reports. Sometimes they contain remarks or recommendations which regard education, science or other fields of interest to a ministry, even though the ministry had nothing to do with the inquiry. The top of the education ministry handles such reports politically. Which is to say that not the contents matters, but the attention the report gets in politics and the media. If it doesn't get attention, it is ignored, unless useful for political reasons. There is no standard procedure for the processing of relevant external reports. If a report has the public attention, and makes assertions or recommendations which the minister or ministry doesn't like, the wish to refute or invalidate them evokes an energy, creativity and "professionalism" that is hard to imagine, and is never shown in any regular activity of the ministry. Which of course is only too compatible with the disregard for the duties and professional norms, and with the frequent recurrence of failures.

Upon the publication of a report with new or otherwise unwelcome ideas about education or other topics of interest to the ministry- "not invented in the ministry"- the minister and top of the ministry quite generally assume a negative attitude. They suddenly demonstrate critical abilities. They defend themselves by claiming that they have always done everything that was needed etcetera. They do as if acknowledgement of the validity of opinions differing from their own amounts to admission of errors, and as if admission of errors shows that they are to blame. They tacitly assume that they are infallible, and that it is wrong to raise doubts about their infallibility. They implicitly suggest that everyone who disagrees with them is mistaken, if not plainly wrong. Sometimes they may nevertheless be aware of the fact that their position is indefensible. In that case they try to get the item out of the public eye as soon as possible. For example by making an ally of the forgetfulness of journalists and the public, or by procrastination in the hope that more interesting news items will divert the journalists' and public's attention. Or to gain time by proposing an "independent inquiry" of specific subjects.²¹

The preceding chapters contain many examples of reports that should have evoked action, but were ignored. See especially the chapters 2 and 5. Although as regards chapter 5 on the Renewal plan it has to be admitted that there are indeed reports which are more or less inadequate, and can be ignored safely. For example because the client didn't want a critical report, and/or because the investigators were no good in the first place, and/or gave a high priority to the wishes of the client and almost none to the norms of sound inquiry. Prevention is better than the cure, and liability for inadequate inquiries is virtually non existent, irrespective of the consequences.

Last but not least: the ministry can afford to ignore even the best reports. Its experience teaches that ignoring advice or criticism is a lot easier than taking it seriously. Even if a critical report catches everyone's attention, it is for only a few days, and soon replaced by something else, and forgotten. After a few months only an irrelevant minority remembers. Only in exceptional cases will the General accounting office (DGAO) check whether anything has been done with a specific report.²² And if the answer is no, nothing happens. The DGAO has no executive or sanctioning power, and there is no other supervision. Parliament should check the proper functioning of the DGAO-system, but doesn't, or only in very exceptional cases.

²¹ By people selected by themselves. Not by for example an Academy of Sciences.

²² And as all of its reports show, the DGAO is not looking for trouble.

Management in the education ministry.

Readers of the chapters 2-5 may find it amazing that heads and directors at the ministry remain passive even when the interests of their unit are seriously threatened.²³ It took years before a responsible director looked at a policy portal. There is not the least indication that SG, uSG and DGPS ever inspected the results of the projects for which they were responsible, and for which they allocated many millions of taxpayers' money. They behaved as if they were only interested in keeping up the appearance that under their leadership NEA (and its predecessors) worked perfectly, and in hiding and repressing everything betraying the contrary. The present section explains why they do so. To a certain extent of course. In principle the explanation applies only to the phenomena described in the reports. That is, to phenomena that do not interest the political heads of the ministry. But because they involve the same people, it is clear that the management of for example policy development cannot be fundamentally different or better.²⁴ Specific empirical substantiation of this assertion would require extra space and time. According to the author this isn't worth the added value, and is therefore passed over.

In a ministry an important distinction is made between activities related to subjects of current political interest and all other activities. This distinction is especially made by the managers. Only subjects which are on the political agenda of the moment get their time and energy. Only progress on these subjects is actively managed (to certain extent). These subjects offer opportunities to please the minister, and to oblige. Other subjects don't. For other subjects it is therefore assumed that everything goes well unless problems are explicitly reported. This is sometimes called the "squeak-system": the management does nothing unless someone squeaks. The problem is that even if someone squeaks action is rarely taken. Or worse: that a manager tries to prove that there is no problem at all, possibly because he doesn't know how to solve it, doesn't want to waste his valuable time on something politically irrelevant, or doesn't want to risk losing "friends" or making enemies. This is the explanation of the passivity. It characterizes the ministry as a political organization, having the power to hide, and to pay the costs of almost any failure.

Because keeping up appearances seems to be the primary goal of the management, its culture can be called a "story telling culture". The reality of the management consists of telling stories. Of words. The top is not interested in the reality behind the words. That reality may as well not exist. They are only interested in the words as a façade. The words are meant for outsiders, to create an illusion. Of course it is crucial that the public and the media believe that the words have their ordinary, normally defined meaning, and do represent reality. This is why it is so very important that the public believes in the integrity of the government. Its words should be taken for facts.

In addition to what has been said above, heads and directors interpret their duties in a very strict sense. If something does not only concern their own unit, but others' as well, they tend not to feel themselves responsible. If they discuss a subject with a director general or (u)SG, they tend to give the answer they think is desired (gratifying). They seem to have been selected for their sensibility for, and compliance with, the opinion of superiors. To define good and bad in the workplace in terms of current office-political opinions. To refrain from saying anything that may displease the superior. They have not been selected for the presence of a gyroscope, the ability to think independently, true interest in education and science, and the detection and rejection of nonsense. But definitely for the ability to keep secrets, especially secrets that would cause a scandal when made public. They are selected for the loyalty of criminals.

The refusal to distinguish sense and nonsense, and to call nonsense just that, is made easier by believing that everything is subjective, and that the truth always lies in the middle. The problem with such niceties is that for example discussions at the ministry during the lunch break clearly showed that at home everyone without exception reasons and acts completely differently, and normally. Outside the ministry, nonsense and truth are rarely thought to be ambiguous or subjective.

²³ The term "heads and directors" is meant to denote all heads of organization units.

²⁴ An important characteristic of policy development is that subjective opinions play a dominant role. Facts often are selected and manipulated to fit opinions. This is just one more reason for making no illusions about the quality of its management.

Idealistic reasoning about competencies and feasibility as a cause of failure.

Both in- and outside a ministry people quite generally argue idealistically. That is to say: as if people or organizations with a given function or name can really do (properly) what the function requires or the name suggests, and that they actually do so. The reports however give numerous examples of people and organizations who do not and/or cannot do their duty or what they promised to do.²⁵ In addition it is often thought that everything that can be imagined can be realized. That the realization of an idea is just a technical problem (not worthy of the attention of lofty thinkers). As soon as one becomes aware of these assumptions one realizes their absurdity. In general it is simply nonsense to assume that people can do whatever they want or should. In reasoning about people and organizations one should be aware of the assumptions one makes about their competences. One should consider the consequences, the risks, of insufficiency of competences.²⁶ One should be aware of the possible necessity of a wide variety of competences. From writing minutes to the management of people who lie about the feasibility and progress of projects.

One of the conclusions that can be drawn from these observations is that one should try to avoid giving people and organizations duties or jobs of which it is doubtful whether they can fulfill them properly. The more so when it is unclear whether they are aware of, and open about, their own limitations, and whether they will report possible inabilities or failures. Duties and jobs should be evaluated much better with respect to feasibility of proper fulfillment or execution with the given human resources. Probation periods and performance appraisals should be taken much more seriously. For projects too a probation period should be introduced. The probation period should be concluded with an appraisal resulting in a “go”(with a possibly amended plan) or “no-go”. (A really independent and critical appraisal that is). Where necessary the goals (and name) of organizations should be adjusted to the true competences of its employees. Not all goals are feasible, not even when there is plenty money.

The top ignores integrity and professional norms, as well as experience.

Lack of abilities is one thing; claiming to be able to do what you cannot is something entirely different. Already in the beginning of the discussed projects fatal errors were made which only for a small part can be blamed on technical inabilities, and mostly on lack of integrity. The commissioner could and should have known that even in the recent past similar projects had miscarried. He should have doubted the ability of the contracting agency to deliver as promised. He should have ascertained that sufficient corrections and improvements had been realized to greatly reduce the risk of repeated failure. All this was omitted. In addition well substantiated warnings, and the people who gave them, were ignored systematically, without arguments or explanation. This was done both in the decision making process, the preparatory phase and during the execution of the project. The top management of the ministry acted as if money grows on trees, and as if nobody will ever call it to account. Risks were ignored, and costs and benefits were not seriously weighed. The management did as if the above quoted article 50 of the General Civil Servants Regulation, «**The civil servant should fulfill the duties which are implied by his function meticulously, and behave as is proper for a good civil servant**» does not exist or can be ignored at will.

The executing agency on the other hand seems to have been led by nothing but greed. By the desire to win as many orders as possible, or rather: promises of money. Cost what it may. It either lacks

²⁵ In fact only a small minority of the employees of ministries were educated for the jobs they actually have. This minority does not include the top. Those who have a higher education are supposed to be “generalist”: to be able to do everything. With respect to their specific jobs they have at most had courses or training programs of a very short duration. SG and uSG seem to think that it is sufficient to create a function with a nice name, to append a salary scale to it, and to appoint someone available who already has that scale. As from that moment they simply assume that the function is fulfilled as suggested by the nice name. This is what happened in the projects Electronic accessibility, Edoc, and NEA. According to the “God said” model. When you know how it works in practice, there is nothing amazing in the failure of so many projects.

²⁶ The reports show that what the education ministry calls risk analyses do not analyze risks. They are only meant to pay lip service, to keep up appearances.

sufficient self-knowledge, and/or failed to investigate reliably whether it would be able to make good on its promises. Or simply acted in bad faith, as a swindler. When during the execution it turned out that too much had been promised, it tried to maintain as long as possible that all was well and nothing the matter. Where necessary by lies, and by falsely accusing people who refused to accept useless products of obstruction and sabotage. If you do things you cannot, and nevertheless want people to believe that you are performing well, you cannot remain honorable.

After the start of a project the integrity and professionalism of the commissioner are especially called upon when the progress of the project has to be evaluated, and when problems require (re)action. Even more in the case of non-performance or misconduct of the contracting agency. This requires intervention and correction, and/or recognition of the fact that the goal was too ambitious. With respect to the problems arising in the projects of the chapters 2-5 however, the responsible managers of the commissioning ministry did nothing. They and the heads and directors concerned gave no support to their representatives. Even though the representatives frequently requested corrective action, and wanted little more than compliance with the code of conduct. Behind their backs managers of the executing agency told the managers of the ministry that everything was fine. Which was obviously incompatible with the test results and with what everyone could see on his own PC monitor. If one took the trouble of looking of course. Which the management didn't. Both commissioner and contractor demonstrated to be part of a wider problem.

In all cases considered the commissioner paid the contracting agency in spite of inadequate or non-performance. He did not declare a moratorium on all except absolutely necessary projects. He did not improve his project management in any substantial way. On the contrary: at the end of 2009 he appointed a contract manager NEA who began his new job on the basis of "I know everything better", including the assumption that everyone is equally right and wrong, except a few prejudiced quarrelers. The recommendations for the development of employees and organization which had been made in the evaluation of the Redesign project, and which were reiterated by Conquaestor and Ernst & Young in relation to a similar project, have never been implemented. They were soon forgotten. Undoubtedly in part because the management lacks the ability to understand and do something constructive with them. After all it would be very surprising to see the top manifest abilities which it had never shown before.

Refutation of the hypothesis of a publicly defensible higher interest.

When told the story of the policy portal project or the renewal project, some people thought that they can be explained in terms of goals (especially interests) or other motives that we, ordinary people low in the hierarchy, don't know about, but which nevertheless exist and may explain what happened. If the direct goal of the project cannot be the goal of the project, then there must be another goal (interest). This subsection tries to show that this hypothesis is no more than an illusion, wishful thinking.

Explanations in terms of interests or other extraneous reasons assume something like rational behavior. Behavior can be called rational if it is determined by a well defined and consistent set of conditions, desires, duties, goals, interests, norms and/or other reasons.^{27,28} In short a well-defined and consistent set of "norms and values". However, the hypothesis of rational behavior not only assumes the existence of such a set, but also that people can reason consistently about it, and about the conduct which optimizes compliance. If these assumptions were correct, explanation of human behavior would boil down to finding the relevant duties, goals and interests. Similarly for (conscious) omissions. People could refrain from certain actions because they might violate norms or harm interests.

²⁷ The "well-defined and consistent" requires specification of the relative priorities of the different goals, norms, etcetera. Sometimes this is not sufficient to decide between available alternatives. Then quantification of the relative priorities of the different goals etcetera may be necessary. Without relative priorities and, in general, quantification, no non-arbitrary decisions can be taken, or choices made.

²⁸ Note that duties and interests may easily give rise to conflicts. Doing ones duty may hurt one's interests.

In this study we are only interested in publicly defensible explanations. For this reason, only publicly defensible norms and values are accepted as a valid basis for (rational) behavior. Greed and lust for power may explain a lot of phenomena, but do not provide defensible explanations. Neither will making a boundary condition of promotion or protection of the personal interests of top managers be considered publicly defensible.

Since an explanation is only considered to be an explanation if it is logically correct (and therefore consistent), it is crucial that the set of norms and values is consistent, and that the reasoning too is logically correct. Inconsistencies create a multitude of possible “rational behaviors”, and thereby annihilate rationality. In practice inconsistencies mean that behavior can both be justified and rejected on the basis of (for example) one and the same inconsistent set of duties plus interests. Inconsistency may be difficult to conclude from a single action. But it can be simple when not a single action has to be evaluated or explained, but someone’s conduct in a variety of activities during a longer time.

The possibilities for rational action (or rational choice) are limited. People have limited knowledge, abilities and opportunities. Even if they have consistent goals and/or interests, they may still be unable to reason consistently about them. They make mistakes. Their (self) knowledge is incomplete, and often incorrect. Forecasting is already difficult with complete information,²⁹ let alone with incomplete information with unknown errors. Of course there are also limitations or even deficiencies in abilities, such as management abilities and the ability to work in accordance with codes of conduct or professional codes. People cannot always reason (see) and do what their norms and values require. Not only because of external circumstances, but in the first place because of their limited mental abilities.

The chances of irrational (publicly indefensible) behavior are increased by false pretensions. For example when insufficient self-knowledge is coupled with a lack of integrity. In themselves false pretensions are already incompatible with integrity. It becomes worse if the pretensions have practical consequences that make the incompetence and the falseness of the pretensions manifest. As when the people incriminated find it necessary to cover up and lie about them, and to silence potential whistleblowers.

With respect to the phenomena described in the chapters 2-5 it has to be concluded that the hypothesis of unknown but publicly defensible goals or interests and rational behavior is extremely unlikely. There is not the least positive indication of explanatory, publicly defensible, interests. On the contrary: if they existed and were publicly defensible, SG or uSG had an interest and plenty opportunities to communicate them. That would have spared everyone a lot of trouble. But they never did. In the discussion of 9/6/09 the SG did not even make the first beginning of an explanation of his actions and omissions, and to elicit the least appreciation of his conduct. The hypothesis of the absence of publicly defensible higher interests is moreover supported by many proofs of lack of integrity and lack of competence. Which also mean that the code of conduct cannot be part of the true norms and values of the top. Last but not least the lack of integrity and competence is more than sufficient to explain all observed phenomena.

In other words: continuing to throw away money at doomed projects, failing to learn, etcetera, most probably have no publicly defensible reasons, and serve no defensible interests. On the other hand the efforts at cover up can impossibly be accidental. They seem meant to serve personal interests at the cost of public interests. Successful execution of a project requires serious abilities. But given hierarchical relations and the power of a ministry, and the complete lack of internal or external control, it is very easy for those in power to keep up appearances.

There is no better basis for explanation than the combination of incompetence and keeping up appearances.

When one considers the totality of developments in and around the Dutch education ministry in 2005-2015 (or a longer period), then one sees nothing that can possibly justify the phenomena described in the chapters 2-5. There seems to be only one reason and goal that can explain these phenomena. Namely false pretensions coupled with the wish to keep up appearances. False

²⁹ At least of present and past!

pretensions about abilities and goals, and the appearance that all is well at the ministry. There is no indication of any better explanation for the behavior of the top management.

If things really go well, or if only mistakes are made, there is no reason for keeping up appearances, and for the denial of mistakes. Keeping up appearances is only necessary if failure is structural, and if it shows the falseness of the pretensions of the management. It is only necessary if knowledge of the truth would endanger the position of the management, and the management wants to hold on to its position at all costs. If the management of the education ministry had been honorable and competent (or only honorable), this report would not have been written.

The conclusion seems inescapable that the described phenomena have to be explained by lack of integrity and lack of competence of the top, in combination with the wish, born from self interest, to make everyone believe that it is doing fine, and that the ministry performs excellently. The delusion is possible because the top has no reason to fear sanctions in case its deceit is discovered. Effective control and regulation are absent. The political heads (members of government) always claim full responsibility for the operation of their ministry. In the unlikely event of discovery therefore, the political top is the most interested party, and will have to shield the ministry.

If the management could do better, then in spite of the only minute chance of punishment, it would still be less risky to perform really good. Successful completion of a project obviously creates less risks and difficulties than a failed project. For most of the projects mentioned there was no real necessity. As demonstrated by the fact that nothing went fatally wrong anywhere when they were aborted, or delayed by years. Most projects were just a waste of human effort and taxpayers money, and could better not have been started. The top seems to have been unable to make correct feasibility judgments, or to get reliable advice. Or failed to say "no". Often, saying "yes" must be the easiest, given the verbal pressure from the contractors on the one hand, and the absence of control and sanctions on the other. If it could have done better, the top should have done so. Proper performance would definitely serve its self-interest. But it should have done better also because the various kinds of failure create risks for the political heads of the ministry.³⁰ For example through publications like this. The reports clearly show that truly competent people could have realized much better results for far less money. Could have realized qualitatively and quantitatively better operating executive agencies, and especially better (project)management. Honorable and much more competent.

Many of the violations of integrity and professional norms in government organizations can be explained by the subordination of the organization to subjective and changing opinions of top officials and politicians, and to their personal interests (and those of their friends).³¹ For the present governments quality seems to exist only in a political sense. The yardstick for quality is the apparent political success of the political head of the ministry, the minister. What matters is not to be right, but to be put in the right. It is the image that counts, not reality. Nothing is appreciated more than successfully keeping up appearances. The successful creation of a positive image of what was done or proposed. Irrespective of true material merits.³² People who can accomplish this go far in this kind of organization and situation. Especially because there is no real opposition or control.

It is incorrect to think that the employees of a ministry serve the interests of society. They serve their superiors, and the highest superiors primarily serve themselves and their class. As long as they keep their ministries opaque, they have plenty of instruments, including spokespersons and spin doctors, and power, to make you believe that whatever they do is in the best interests of society.

For the given reasons, the observation that a ministry does not learn from its errors and failures need not mean that it learns nothing at all. It may be very successful in its image management, in keeping most of its failures secret, and in making the population underestimate and forget the failures which do get public. This is what members of government and their top officers are really good at. This is what has their priority, and what they are eager to learn more about.

Of course all this also means a complete lack of respect for people.

³⁰ Creating a risk for a political head is the mortal sin in a ministry.

³¹ And first of all of course: their false pretensions. But this is not repeated every applicable time.

³² The letter of minister Hermans to parliament about he project Redesign is an excellent example.

An important other goal is budget maximization.

Neither policy portals nor renewal plan were really necessary. But money was available. Reality is, that there is a never ending battle for the tax receipts between the different ministries. Every ministry tries to secure as much money and as large a portion as possible. This battle already rages for centuries. In combination with the complete lack of power of the population and the false pretensions of politicians, this battle can be seen as one of the main engines of the perpetual growth of tax pressure and government. It is a manifestation of a real problem, to some extent independent of the integrity and competence of ministers and their ministries. The fundamental problem is, that no objective or generally accepted- logical, scientific, or what have you- method for the distribution of the tax receipts over the ministries is known. It is no more than wishful thinking and concealment to speak of "political choices". In reality these "political choices" are nothing but the result of negotiations (battles) between ministries and/or their ministers. Either or not via the ministry/ minister of finance. The distribution has little to do with choice, and much with trickery, manipulation, and power play. And since none of the ministries wants to spend less than last year, or to have a smaller increase than other ministries, etcetera, and since it is often much easier to bleed the taxpayer than the colleagues in the cabinet, it is the taxpayer who foots the bill.

For a ministry, the high priority given to the desire to keep or increase its budget is an inexhaustible source of violations of integrity and professional norms. A ministry feels that it should always keep in mind that it has to negotiate with the other ministries every year. It needs to manage its negotiation position. Its position should not for example be undermined by a failure to exhaust the given budget. A remainder would suggest that the budget was too high, and can be reduced. Asking too much is wise if it is unknown how much money will be available next year, and what other ministries will need or ask. It is even wise irrespective of financial prospects, as part of any negotiation strategy. For this reason, it is useful to invent new items which can be used to absorb the potential extra money. Some of these items may be really useful, but others probably are a waste of money, or worse. A useless project may waste the energy of good people, who for the duration of this project can do nothing better. Anyway, these items are mostly "sold" with false pretensions. Not integrity but earning money has priority. Similar mechanisms determine the distribution of "windfalls" in government income, and budgets for special purposes. If a ministry feels slighted in the negotiations, it calls upon its minister, who calls upon his colleagues in the cabinet. And if the decision making about projects like the policy portals or system renewal by the supposedly expert ministry already is utterly inadequate, nothing is to be expected of the evaluation of the unreliable and badly specified plans submitted in budget negotiations at government level. For practical reasons, beyond a certain point, negotiators have to trust one another, even though they know that this trust is incompatible with experience.

In general furthermore it is not completely clear what integrity means or should mean in the framework of negotiations. It is certain however that maximization of the budget of a given ministry benefits from a believable amount of misleading, or tacit agreements about acceptance of appearances. Ministries know of one another that they "play games". This is accepted, even though ministries are not averse to abuse each other's mistakes.

Something similar happens inside ministries (as in other organizations). The relations between directorates-general and directorates are similar to those between ministries. With one important difference: a ministry is organized hierarchically, and (u)SG has more powers, and more relevant information than a cabinet or prime minister.

It will be clear that the fact of negotiation relations has an important influence on the integrity and professionalism of the work of the ministries. Keeping up appearances may be politically desirable anyway, but is also an instrument for budget maximization. However, the question which of the two has the highest priority is not important for this study. What is important, is that budget support requires the outside world to believe that the activities paid for with this budget are important and necessary. In other words: what the chapters 2-5 describe can be explained by the wish to keep up appearances in order to protect the budget and the power positions of those responsible.³³

³³ Of course in the context of lack of control, relatively easy access to money, and inadequate law.

Everyone who wants a more honorable (transparent, reliable) government will have to take good account of the problem of the budget distribution. In particular it has to be ensured that ministries and/or supervisors report critically and reliably about the work of the ministries, the effectiveness and efficiency of the spending of their budgets, and so on. Errors should be openly admitted, and not the ministry but those responsible should be sanctioned. Integrity can be made conditional if equality is guaranteed by a supervisor.

Nobody feels responsible.

Hierarchical relations undermine feelings of responsibility.

A minister is the head of his ministry. All its employees, including the secretary-general, are subordinated to him. From a formal, legal point of view the minister is the only one responsible, and from a practical point of view even more. This is the only true and defensible position. The reason being that the hierarchy really works as a hierarchy. That is, as a dictatorship. Nobody else has any independent authority and responsibility, and indeed, nobody else feels responsible. At least not for what he does or does not, or at most to a very limited extent. Ultimately an employee only feels responsible for the way he does what his superiors ask or expect. Not only for formal reasons, but also because one has no authority or means to act as one would when responsible, and because one knows from experience that doing otherwise is meaningless and/or risky. For practical reasons most employees simply cannot do what they would do if they were to account for their conduct personally. The following example did not fit in the reports of the chapters 2-5, but shows some of the relevant mechanisms rather explicitly.

An example: IAG refuses to incorporate a correction mechanism in a databank.

The agency IAG/NEA wanted to make a register of diplomas. The register was meant to make fraud more difficult, and to increase efficiency. The register was to be accessible through the internet. IAG thought that it already had the necessary data about the diplomas and about the people who had received them. Of course IAG wanted extra money for the development of the register. The development of the project is a story in itself. Because the added value with respect to the chapters 2-5 is very small most of that story is passed by. I only mention a few minor events which show the absence of a feeling of responsibility by some of the participants. And its consequences.

The group of future users of the register included the institutions of higher education. The content of the register, and the information which was to be accessible through web pages was therefore discussed with them. For discussions about matters of common interest there was a Joint Working group Student data (JWS). This group met every few months in the town of Utrecht. The meeting of 29/10/10 was chaired by Ron van der Meer, head of the section Finance of the directorate for higher education (HE). It was attended by the contact of HE for IAG, Van Velsen. After the meeting, back at the ministry in The Hague, Van der Meer and Van Velsen evaluated the meeting. They agreed that the performance of IAG was inadequate. On the one hand IAG claims the legal status of "basic register" for the diploma register. On the other hand it doesn't want to comply with the legal obligations this brings along. Such as the obligation to take corrective action if an error in the register is reported. In the meeting, Hans de Haan, one of the representatives of IAG, had implied several times that IAG was unwilling to incorporate the necessary service in the register as a system. Several promises which IAG had made in earlier meetings of the JWS about quality assurance remained unfulfilled. Van Velsen argued that the ministry (in practice HE) should do what is necessary to make IAG work properly, with respect to this as well as other subjects. The ministry pays, and the minister is responsible. Van der Meer denied that it was HE's duty to take an active position. It should leave IAG alone. The ship would run aground of its own.

It is rather unclear what this metaphor was supposed to mean in practical reality. In a certain sense the ship ran aground frequently, as we saw in the preceding chapters. But this clearly doesn't mean that IAG comes to a standstill. If only because the ministry quickly comes to the rescue. It covers errors and failures, and provides new money. Examples: policy portals, datawarehouse, and renewal plan. There are no counterexamples.

In the next meeting of the JWS, on 10/12/10, it turned out that IAG had not made any progress with respect to error correction, in spite of the reminder in the meeting of 29/10/10. Half a year before, IAG had been asked to inquire how other managers of basic registers handle this question. On 10/12/10 De Haan declared that the matter had been “discussed” in IAG, but without result. He couldn’t say anything more. To make matters worse the chairman of the meeting, Paul van Capelleveen, who took the place of Van der Meer, said “to sympathize with IAG”. This meant that for months at least nothing would be done. Van Capelleveen may have wanted to be kind, may have been prepared insufficiently, failed to use his brains, and/or be incompetent (or a combination of these). Knowing even a little about IAG, which Van Capelleveen certainly did, a professional would have been more careful, asked questions, and made reservations. The more since several other people in the meeting had unambiguously shown dissatisfaction about the non-performance and attitude of IAG. IAG had not given any plausible reason for not doing what it had promised and was obliged to do. The ministry took no corrective action. (Neither then nor later). The misconduct was simply condoned.

Neither Van der Meer, De Haan nor Van Capelleveen gave any sound argument for doing nothing. What they did say could be refuted easily and indisputably. None of them felt responsible. It is evident that they would behave very differently if they would have had to account in a serious manner for their (in)action towards a superior or the public.

Note that if IAG really was a professional organization and wanted to provide reliable services, it would find a good and user-friendly correction system self-evident, and waste no words and time about it.

The minister gives no sign of feeling responsible.

As far as the reports of the chapters 2-5 are concerned, the minister might as well not exist. He shows no interest, and does not check or interfere in any way. In other words: the reports are incompatible with the hypothesis that the minister feels responsible, or that in his case “feeling responsible” has any practical consequences. He probably relies on his immediate subordinates, and blindly. But he cannot know, and never tries to find out, whether trust is justified. This too would seem to be incompatible with a feeling of responsibility.

Note that here too there is no trace of any control or correction mechanism.

False pretensions cause integrity violations.

There are also causes of integrity violations that have nothing to do with budget maximization. Most of the described dishonorable conduct can be explained by false pretensions. By the wish to appear honorable and competent. In general: to appear far better than one actually is. If only due to a lack of self knowledge, and/or a distorted concept of integrity. And even though the pretensions miss any basis in reality, and can only be maintained by silencing everyone who refuses to replace truth by illusions. The reports (and the daily news!) show numerous people and organizations who/ which systematically bite off more than they can chew, promised more than they can fulfill, and as a consequence waste people’s time and money. Or worse. The reports show that those responsible deny failure, or put the blame everywhere except on their own incompetence. The reports show that the responsible employees try to keep their errors and failures hidden by other forms of misconduct, and that they systematically ignore codes of conduct and other generally accepted integrity norms. The report shows that bad easily elicits worse. That in cases where suppression of the truth turns out to be difficult, more and more people and units are requested to collaborate in covering up non-performance and misconduct. People are required to accept the side tracking of colleagues who dare complain about misconduct, and dare to ask the management to enforce the code of conduct. They are required to accept that their organization collaborates with auditors and external organizations in cover-ups.

Similar phenomena can be caused by efforts of government officials to get people accept proposals which are substantiated insufficiently, or can be shown to have harmful effects on the general welfare, and would not get a majority without such efforts. Where necessary the top officials who originated such proposals use tricks, cunning, and deceit to generate support. And they don’t stop at that. They also require silence or active support (“loyalty”) from their subordinates. Ditto in the case of

unjustified or incorrect statements about causes and effects of unwanted phenomena, and unwanted effects of regulation and policy. The government is always right. Cost what it may.

In short: false pretensions of higher ups “force” their organization to behave dishonorably, and to eliminate employees who give the norms and interests of society higher priority than the personal interests of their superiors. In this way corruption spreads and deepens.

In the described projects honorable and competent management could have prevented, or minimized, the spreading and deepening. Competent managers and commissioners don’t let themselves be cheated by nice looking presentations of castles in the air. They distinguish words and deeds, theory and practice, and take account of experience and the reliability of the speaker. They ask verifiable intermediate results and clear reporting, and don’t accept selective half truths. In the described projects we see a commissioner who orders products to be developed, pays lots of money for that, but otherwise remains passive, irrespective of (lack of) progress. We see a management that reacts to misconduct and useless products not by corrective action, but by action against its own representatives who don’t accept misconduct and useless products. It is these people who occupy the positions of power in the organization. Everyone else has to accept and adjust, or leave.

The higher in the hierarchy, the more false pretensions. False pretensions as cause of problems.

Not everyone has the illusion that he or she can accept or bear responsibility for the work of 10, 100 or even thousands of people. For making them do together what the organization is required to do, effectively and efficiently. Not everyone is willing to promise and pretend what members of governments and other politicians promise and pretend.³⁴ At one time or another you may have wondered how the suitability of candidate ministers for being head of a ministry is evaluated. The answer is that there is no indication that they are evaluated responsibly or professionally, or even evaluated at all. On the contrary. From both the absence of indications of necessary competence in CV’s of ministers and the way they do their job it can be concluded that only rarely can these competences be demonstrable. In general there is every reason to doubt their presence. It seems to be simply assumed that politicians, or people with experience in parliament, have these competences, or that these competences are not really needed, on the assumption that they are supplied by the SG (and that such a model of the job is sound). For decades the education ministry has not had a minister (head) whose previous career shows the ability to manage and lead a large organization. And indeed, at the ministry they never showed this ability. They never led in any meaningful sense of the word.³⁵

Something similar applies to most or all members of the higher management. Their abilities are far less than what they pretend and should be able to. Like the minister they may think that they can rely on their subordinates. However, like the minister, they cannot really judge the abilities of these subordinates. They must trust them blindly, or just work with them. This is obviously risky. Therefore the management relies heavily on the power of the minister and ministry, and on the loyalty within the management, to solve or cover problems. Where “solve” should be understood in the political sense: making sure that nobody talks or writes about them publicly.

It is evident that honorable people with adequate understanding and self-knowledge, who do not pretend more than they can, and who are unwilling to saddle other people with harmful consequences of their false pretensions, will not apply for jobs which make them responsible for activities nobody can vouch for. Experience shows that higher functions require more pretensions than functions lower in a hierarchy. Jobs which require the impossible, induce self selection of people who pretend too much, are willing to take risks at the cost of others, and don’t mind misleading others for what they consider a good purpose, and rolling off the costs of their inability and arrogance on innocents.

Conversely this selection mechanism can be seen as part of the explanation of many government activities which do not produce what they are officially supposed to. It explains the structural resistance against transparency and truly independent evaluation. Transparency and independent evaluation would expose the false pretensions and lack of integrity and incompetence, and unmask those responsible. The given pretentious political and government culture can be understood as being

³⁴ Including by their oath on the constitution.

³⁵ To be distinguished from both dictatorship and passivity (except perhaps in the case of a few hobbies).

caused by, or the result of, the indicated selection mechanism. It is logically inevitable that it causes widespread failure, harm, and risk.

The observation that some jobs require sheep with five legs does not justify the pretension to be such an animal. Neither does it justify using the fact of their non-existence as an excuse for the failures which the pretension causes. Let alone for trying to hide the failures and the falseness of the pretensions. It is only the acknowledgement of the problem.

The conclusion is that politics and government can only work responsibly and transparently if they become much more modest. They can only work responsibly and transparently if they match their pretensions with their abilities. Only then can they do without trickery, deceit and other forms of abuse of power.

Corruption is spread by selection.

There is not just one organization culture: there are incompatible cultures.

The reports suggest a mechanism by which the top of a hierarchical organization ensures that the power in the organization remains restricted to people with the same norms and values. The norms and values which define the subculture of the top. The mechanism is selection. People are selected by promotion, by selecting “suitable” participants for specific activities, and by deselecting people with incompatible norms and values. Of course the mechanism is appropriate if the top is honorable and competent. If not, then one can expect the phenomena described in this study. Up to and including the extinction of systems for control and correction. This is only logical. In the education ministry people who ask for using common sense, who require agreements to be kept and compliance with the code of conduct, are eliminated from processes where such an attitude may cause trouble. The silent majority interprets this as a warning, or is less critical “by selection”, or invents excuses, especially for doing nothing and not feeling responsible.

For a corrupt culture the co-optation of kindred people is necessary for survival. Those who share this culture know only too well that they cannot refute the criticism expounded in this study.³⁶ Giving positions of power to honorable and competent people would make the positions of dishonorable and incompetent people untenable.

It is important to note that the subculture of the top is not shared by the majority of the employees, and even less by the population in its entirety. It is improbable that you, reader, aspire to top positions in politics or administration. But even if you were put in a position of power it is unlikely that you would behave similarly. That you would behave similarly is no more than a hypothesis which the present top wants you to believe. Namely because it suggests that it behaves normally, and that there is no alternative. The hypothesis serves the interests of the top. What the reports show is that people differ greatly, and that people like those in the top are rare but common. They are rare not with respect to positive abilities, but with respect to their exceptional arrogance and false pretensions. Regrettably, this kind of character is rather common too: one finds them in every larger organization.

As a rule it is assumed that people differ mainly and mostly in their abilities in the various fields of human activity. And that other differences are less relevant and need not be taken into account.³⁷ In particular that differences in norms and values do not “really” exist, or are irrelevant. The reports show that these hypotheses are incorrect. Hypotheses like these make historical and social phenomena incomprehensible.

In the meantime the homogeneity of the group of top employees with corrupt norms and values precludes improvements without replacing the whole top, and their entourage, by people with defensible norms and values. Which is difficult because these people never got an opportunity to gain experience in a top position.

A consequence is that at most a significant failure can stop the merry-go-round. On a small scale this happened for example in the policy portal project and the renewal plan(s). The cases support the conclusion that this does not (cannot) lead to improvement. The corrupt system is stable.

³⁶ As demonstrated by SG Koos van der Steenhoven of the education ministry in his talk with the author in June 2009.

³⁷ “Except of course with respect to common criminals.” As if this would be a well defined and isolated group.

The conclusion is that it is understandable that there is an evolution towards a top which is not honorable and cannot do its duty properly.³⁸ Its most important competence is self defense: keeping up the appearance that everything goes well. In their self defense they are supported by power and an inexhaustible amount of taxpayers' money. The reports clearly show that the top is very well able to cover-up, but not able to really solve any (solvable) serious problems.

People do not have the same conscience.

There are neither empirical nor logical reasons to assume that people have one and the same conscience, or even a very similar conscience. The reports show that the norms and values, and therefore the consciences, of ministers and high officials differ substantially from the norms and values which are generally considered desirable or self-evident.³⁹ By definition people judge behavior by the measuring stick of their personal norms and values. In the context of judging, norms and values are called conscience. Differences in norms and values mean differences in conscience, and different value judgments. That the conscience (= norms and values) of ministers and high officials differs from the standard is therefore confirmed by the observation that they are happy about their own performance. This observation shows that they judge their performance with other norms and values than other people. In other words: that they have a different kind of conscience. A conscience that enables them to act contrary to generally accepted norms and values. Someone who thinks that this is evidence for the absence of a conscience, and calls it unprincipled, should realize that every being that has to make choices must have norms and values. For such beings the absence of norms and values, or principles, is a logical impossibility. But logic allows, and reality shows, important differences. People may have very different consciences. They should not be assumed to see or value things similarly.

How decent people become helpless.

Someone who applies for a job, or accepts a job, sometimes does not and cannot know that the job requires more or other abilities than advertised or mentioned by contact persons. Neither can one always know or even guess beforehand that in practice the management of the organization applies norms and values which differ from those professed by its public relations officers, press releases, and public image. Once part of the organization, and having seen how it works, the question arises: how to cope with the contradictions? In other words: how can one handle this unexpected and unknown situation? A situation for which one is not prepared, and which one may find troublesome, objectionable or completely unacceptable? What *can* one do? Practical answers are difficult because there seems to be no solution that does not cause personal harm.

It is seen that an incorrect picture of the necessary abilities, and insufficient abilities, can be sources of incalculable problems. The reports show that in general people are unable to solve them in an honorable way. Especially not in a way that is compatible with the code of conduct.

The above questions concern everyone. Integrity officers too. Because of the theoretical-idealistic education program and a never ending stream of misleading government information they too can impossibly be prepared for structural deceit by authorities. And indeed, the one who coached the author couldn't cope.

Why integrity violations are rarely reported.

The reports show that integrity violation in the Dutch education ministry had a structural character, and a dominating and disastrous influence on several projects. The reports show that the observed abuses were known to the management, and that the management did nothing to eliminate them. Promotion of people responsible for the abuse suggest that the top of the ministry approves misconduct. There is no indication of either formal or informal reporting about the abuses reported in this study by employees of the ministry. For example in the annual reports of the integrity officers. It

³⁸ Given power and a political establishment with common interests.

³⁹ As laid down for example in codes of conduct and integrity codes. The overwhelming majority of novels provides additional support for the text.

seems improbable that somebody else beside the author has ever reported integrity problems in any of the projects mentioned. Namely because the efficacy of reporting misconduct is greatly helped by cooperation. And the author never made a secret of his opinion and complaints.

It has to be concluded that violations of the code of conduct are rarely reported. This is not difficult to understand. There are many possible reasons. In the first place many people tend to identify what is normal in practice with what is normal in a normative sense. That is: to think that what happens in practice is the way it should be.⁴⁰ In the second place objectionable behavior is only rarely understood as violation of a code of conduct. Many people seem to have little difficulty with a double moral (= two distinct and incompatible sets of norms and values): one for home, another for work. People can get so used to what actually are integrity violations that they don't even notice them any more. And if people nevertheless realize that specific conduct is incompatible with the norms and values of an applicable code, they may still fail to realize that the code is supposed to be complied with (for good reasons!), and that violations allow for an appeal to the management. Another possible explanation is that people think they live in the best possible world, that nobody is perfect, and that parliament controls. And last but not least: most employees consider an appeal to the management to correct misconduct unrealistic or even ridiculous.

Probably there is a selection effect too. Due to various causes relatively many people may have been appointed and remained who accept the actual norms, or consider them normal or good. Relatively few people may have been appointed, and/or many left, who find the actual norms objectionable.

Finally there is the terror by governments. That is: the organized efforts by politicians and high officials to make the lives of whistleblowers as unbearable as possible, and to make this well-known. With complete disregard of the law. Governments obviously want to discourage the reporting of their misconduct. As a consequence, most employees of government organizations are very cynical. They think that whistleblowing always ends badly and changes nothing. In spite of the freedom of speech and codes of conduct, speaking remains silver, and silence gold.

Whatever its explanation, it is evident that the whistle is blown far too rarely. In all avoidable man-made disasters and other influential cases of misconduct, such as the Bhopal accident, the corrupt practices of Cresson at the EU, the Love Parade accident in Duisburg, the North-South line of the Amsterdam metro, the oil leak in the gulf of Mexico, and the subprime crisis, many people have known of malfunctioning people and/or systems. Many people must even have been legally obliged to go public. But only in extremely rare cases this is done. It follows that there must be very much that should be made known but isn't. The alarming fact is not that sometimes things go wrong. That may be inevitable, even if everybody is honorable and competent. Instead, what is alarming, is that one of the very few existing safety systems is being forcefully repressed, and not allowed to operate and have a preventive effect. In a world brimming with very large, and ever increasing risks.

The following is a pointwise summary of the causes of the silence about even dangerous misconduct, with a few variants and supplementary remarks:

- The terrorizing of whistleblowers by governments, and the absence of corrective effects of whistleblowing;
- The belief that "in our country" things are organized in the best possible way. Parliament controls the ministers, the hierarchy is therefore legitimate, and Befehl is Befehl;
- A normative interpretation of reality: the idea that things should be done as they are done in practice. In combination with the ability to live with a double moral;
- The idea that the code of conduct is only meant as an ideal, and should not be taken literally or seriously;
- The idea that reporting misconduct only has negative consequences;
- Fear of reprisal (in spite of whistleblower laws);
- The force of habit;
- Selection of people who adjust to the environment (like a chameleon);
- The idea that change is impossible ("you cannot change people");
- The idea that it is not your responsibility;

⁴⁰ Note that children unconsciously assume the same.

- The idea that it is not too bad;
- Lack of understanding and reflection;
- Closing ears and eyes for everything that might undermine one's peace of mind.

Causes of inadequate inquiries and inadequate supervision.

The reports show that present-day law and institutions do not have sufficient preventive and corrective effect. None of the studied reports of consultancy firms, supervisors or inquiry commissions gives a clear and reliable picture of the course and results of projects and processes, and of the competences and conduct of the people and organizations involved. Investigators seem very much inclined to overlook or ignore deficiencies in people and organizations, or to indicate them with understatements, metaphors and other ambiguities. They are so "good" at diplomatically describing (or rather indicating) abuse, that one may need the most suspicious reading to avoid complete misunderstanding. For example when a report asserts that "there is room for improvement" instead of "... is insufficient".⁴¹ (As a consequence) They advise superficial remedies even for major problems. Which of course is insufficient, as all cases prove. Repetition of errors and failure is the rule. Even auditors with a professional code are seen not to balk at fraud.

To a certain extent the unreliability of inquiry reports can be explained from a desire to deliver what is assumed to be requested, and/or to keep the relation between the investigators and their organization on the one hand, and the organization being investigated on the other, pleasant, or at least workable. Of course in combination with a failure to accept the code of conduct or professional code as an inviolable boundary condition.^{42, 43}

The superiors of the investigators probably don't accept openness and clarity about abuse from their subordinates. They give priority to a well-filled order portfolio, and fear the consequences of "too much" openness and clarity. The firms doing the investigations are hierarchical organizations. Superiors have to approve the reports of their subordinates. Nothing leaves a firm without a signature from the higher management. Not the codes, but the wishes of superiors are conditional for investigators. For that reason the superiors are at least co-responsible for the unreliability of inquiry reports. Not only formally, but practically too.

Just like everybody, investigators don't like repeating themselves in successive reports. For example by exposing the same abuse year after year. Also, but not only, because it shows the futility of their work. Conversely a reader who understands their difficult situation should attach great weight to observations which are repeated year after year. But the most important may be that in general the investigators see very little effects of their work. Often they have to listen meekly while those responsible for abuses push well founded but understated criticism aside with misleading tattle, and have to look on helplessly while parliament and media accept this tattle unthinkingly. Sometimes inquiry reports do raise dust. But the dust almost always settles quickly. Rarely if ever is it followed by adequate corrective action. In other words: this kind of inquiry is terribly frustrating.

But although this is only too understandable, the consequence remains that even crucial inquiry reports are unreliable, and do not comply with the applicable norms and codes. Which means that one of the few systems for control is effectively switched off.

Here too, there may be selection effects. Namely by a preference for investigators with rose-colored glasses, a "positive attitude" or "political sensitivity", "realists", and people who for whatever reason are less able or willing to take their professional code or public expectations about their role seriously. This in addition to the relatively early departure of those who are unwilling to keep their

⁴¹ "Can better" is a practically empty judgment, and should never be accepted.

⁴² The codes are almost always public, and in that case reflect what the overwhelming majority of the population considers desirable or normal. The findings of this study are compatible with the hypothesis that many or all of the codes are primarily meant to mislead the public by suggesting that the people in a given organization or profession work in agreement with these rules. Note that there is no corresponding system of supervision, enforcement, and sanctioning of non-compliance. At least nothing in the least practical and effective.

⁴³ It may be a problem that clients won't give contracts to firms which really respect the codes. This problem may be reduced by making firms liable.

eyes and mouth shut, or to soften criticism beyond recognition, and who find professional codes and the public interest more important than the short-term interests of the firm and its management.

Finally it should be remembered that investigators in general depend more or less on the cooperation of the investigated organization. Investigators should carefully manage their relations, if not for the present inquiry, then for future ones. Often this situation may seem to require compromises. Which however can easily conflict with professional requirements. The dependency creates a risk for the quality of the inquiry.

Because of the mechanisms (and other causes of failure) indicated above, expansion of supervision and inquiry is meaningless. It is utterly insufficient. It is the mechanisms which have to be neutralized or eliminated. The independence and quality of supervision, inquiry and reporting should be corrected and improved fundamentally. Maybe this isn't possible to a sufficient extent. At least some of the mechanisms seem to be an intrinsic part of inquiry and supervision by outsiders, and the client is obviously co-responsible. One can furthermore ask oneself whether supervision by outsiders can ever be as effective, let alone as efficient, as that exerted by the employees themselves.

Earlier in the study it was noted that where a choice exists, inquiries are made only if the results are expected to be publishable. In addition it is obvious that it is the most blatant abuses that will be most softened in the inquiry reports (if not kept under cover completely). The combined effect of all these mechanisms is that the public gets a positively biased picture of what is happening around them.

Politicians exclude themselves from liability, criminal law and independent administration of justice.

There is a glaring contrast between the impunity of the heads and top management of government organizations, and the punishment for integrity violations meted out to employees in the lower ranks of these organizations. Especially if one considers that the misconduct of the heads and top management causes much more damage. It causes damage along both the human, administrative and financial dimensions. Those who excuse such people by noting that they do much good too, should not only prove this, but also explain why they do not apply the same argument to employees lower in the hierarchy, and to common criminals. Neither the (Dutch) General Civil Servants Regulation, the codes of conduct, or other documents about integrity offer substantiation for this kind of apologies and discrimination. It should furthermore be explained why the proportionality principle is not applied. In other words: why the punishment is not proportional to the damage caused.

Present-day law applies arguments for punishment and liability selectively. Contrary to what is often said and believed, there is no equality before the law. In the run up to the financial crisis and in all other cases in the preceding and following chapters one sees officials operating as if they have nothing to fear from non-fulfillment of duty. It is inconceivable that the cases would have occurred if the principal persons would have had to fear liability claims or punishment (including imprisonment for life). There can be no doubt whatsoever that liability and criminalization will make incompetent people think twice before accepting a job, and everyone in public administration act much more responsibly.

Nobody openly defends the opinion that crimes should remain unpunished, and nobody says to believe that criminal behavior can or should be combated without criminal law. Why then is there no (effective) criminal law for the misconduct described in this study, or why is it almost never applied? Why should one believe that gross misconduct in government can be eliminated without criminal law and punishment, if at the same time one is expected to believe that the same is impossible for other forms of misconduct, especially the lighter forms? What is the justification for the inequality that this implies?⁴⁴

Something similar can be said with regard to unequal liability, and the obligation to recover damages caused by avoidable behavior, and/or as a consequence of failure to adequately perform a function in government or another public organization. Such as supervision, the maintenance of financial stability, and containment of systemic risk. Where it is to be understood that the costs of

⁴⁴ Textbooks on criminal law offer none. For authors and titles see the references in *Het recht van de logica*. An example of an American textbook is Wayne R LaFave, Criminal Law, Thomson West, St Paul (MN), 2003, ISBN 0-314-14997-X.

liability are not to be covered by the public administration or the Treasury, but for as large a part as possible by the responsible officials personally. Someone violating a law or code of conduct does not act on behalf of his organization, and cannot claim its protection.

The Civil Servants Regulation says that the competent authority, in a ministry the secretary-general, can deal with integrity violations by subordinates. It does not tell how integrity violations of the competent authority itself are to be dealt with. Or discrimination by the same authority, or a failure to take action. The Civil Servants Regulation seems to assume that the competent authority is honorable. As this study shows, that assumption is incorrect.

Codes of conduct and professional codes have no teeth. There is no procedure that guarantees independent evaluation and sanctioning of infringements. Whistleblower regulations do not provide for effective measures against those who were responsible for the misconduct which necessitated the whistleblowing. Not an independent judge, but coalition- and party members who depend on public authorities for their future career decide whether these authorities informed parliament and public timely, completely and correctly, or lied. In the present democratic constitutional states there are two systems for the administration of justice. One for the top of the public administration, and an entirely different system for everyone else.

It is a mistake to think that the given democratic constitutional states cannot be improved substantially.

Many discussions about law and the democratic constitutional state seem to be based more on blind faith than on experience and logical reasoning. The idea that “the democratic constitutional state” is a good or the best possible regulation for a state (or a group of people) is based on several misconceptions. In the first place “the democratic constitutional state” is not well-defined, contrary to what is suggested by the definite article “the”. There is an infinite number of ways to organize and regulate a democratic constitutional state. Reality shows many examples, and many more can be devised with little effort. The different democratic constitutional state forms differ with respect to all possible laws, including those regulating the democratic and constitutional aspects of the state.

The possibility that a certain existing democratic constitutional state is the best of all existing state forms cannot be excluded. Although it is far from clear in what sense it is “the best”. Being the best of the given systems does not however mean that is good in this sense, that a timely, completely and correctly informed population would agree voluntarily with its constitution, or has good reasons for assuming that society will benefit from it, in a logically tenable sense.⁴⁵ Assuming that the population would understand and apply the relevant information. Examples of characteristics of the existing democratic constitutional states that cannot be voluntarily accepted consistently or without losing one’s self-respect are:

- The possibility to pass the costs of damage by avoidable human activities onto people who were kept out of the decision making about the harmful activities;
- Forms of representation which practically mean that the representative gets a blank check. In other words: without the possibility of binding instructions, recall and replacement. (Note that this kind of “representation” is restricted to politics. Everywhere else in society it would be considered plain madness);
- Forms of representation which mean that one can only chose for a package of opinions;
- Decisions which cannot be turned back when it is found that the decision makers were not informed timely, completely and correctly;
- Adjudication by judges whose future depends on those they have to adjudicate;
- Adjudication of which the result depends on the financial circumstances of the parties.

All present-day “democratic constitutional states” have all of these characteristics. They could easily be precluded or eliminated by an (improved) constitution. An acceptable constitution should

⁴⁵ Majority decisions may hurt society, and do not by definition serve the general welfare. Conversely, what serves the general welfare could not only be approved by a majority, but also unanimously. This is a purely logical observation. For a simple proof see *The law of logic*.

furthermore give people a realistic opportunity to go to an independent judge if they think the constitution has been violated, and give the judge the power to enforce compliance with the constitution, and punish the violator(s). In present-day democratic constitutional states this is at most possible in part. In the USA partly, in the Netherlands not at all. Not all damage causing activities and omissions are adjudicated similarly. If public administrators or their employees ignore integrity and professional norms in spending taxpayer's money, they don't have to pay damages. Parliament allows them to fill even the biggest holes with empty tattle. The reports show that they are frequently rewarded for (or at least notwithstanding) costly misconduct. With promotion or a very well paid job in government or a government agency (which in the Netherlands include universities).

In short: the dysfunctioning observed in the reports is not an unavoidable consequence of the best possible system. It is a manifestation of inequality aimed at safeguarding those in power against liability and punishment. It is a manifestation of fundamental systemic deficiencies..

Legal inequality as an instrument to prevent whistleblowing.

Article 28 of the Dutch whistleblower regulation (law) of 1999 is unthinkable if the government really wanted to eliminate misconduct and therefore facilitate justified whistleblowing.⁴⁶ What remains of the article if legal technicalities are skipped is the following:

«If the judge declares that a whistleblower was right, the competent authority reimburses all really and reasonably made expenses of every separate procedure, with the understanding that:

- a. the reimbursement is made without application of the tariff system in the decision previously mentioned;
- b. the costs of professional juridical support by a third party is reimbursed for an amount of at most € 200 per hour, up to a total amount of at most € 5000, where both amounts are exclusive of VAT and office costs.»

In the first place it is to be noted that in practice € 5000 for legal assistance is a very small amount. It may be possible to get a good lawyer for € 200 an hour, but the better lawyers, and I presume those of the government, are much more expensive.⁴⁷ And if these amounts are adequate, why not for the government too?

The costs furthermore are only reimbursed if the judge decides in the whistleblower's favor. That is: if the whistleblower had good reason to complain. This is equivalent to saying that the top of the government organization has been warned adequately, should have corrected things themselves, and failed to do so. The top preferred litigation. It follows that top managers made important errors of judgment. In the first place because of the abuse complained about, and in the second place because of their inadequate reaction to internal reports. They did nothing, even though they had plenty of time to reflect and change their minds. This follows from the fact that the regulation prescribes a long (years) and difficult (unacceptable) internal procedure to be finished before allowing an appeal to a judge. The judge will only accept to consider a whistleblower's case if the internal procedure was completed. In spite of all this, reimbursement of costs of the whistleblower are limited, and those of the "competent authority" which was proven dishonorable and/or incompetent, is not. In other words: if the whistleblower was right, and the top of the government organization wrong, the responsible government managers can freely use taxpayers money to pay for their defense, while the whistleblower has to pay largely from his personal account. Why is the reimbursement of one party conditional and limited, and that of the other party unconditional and unlimited? Why is the procedure and regulation strongly biased in favor of the government?

The conclusion is that the regulation is a manifestation of legal inequality, and of a strong bias in favor of the top of government organizations. It is incompatible with the fundamental norm of equality before the law. The regulation virtually ensures that the whistleblower will lose an appreciable amount of money, while the responsible top has to pay nothing at all.

⁴⁶ The regulation can be found in the directory Integrity under 20091215.

⁴⁷ In 2019, a prominent criminal lawyer asked 500 € an hour, and a deposit of 50,000 €.

Reasons for punishment and criminal law.

The literature about criminal law gives the following reasons for criminal law, and for punishment according to the law:

- Damage caused by avoidable behavior of people has to be recovered;
- Crime should be reciprocated;
- Crime should not benefit the wrongdoer;
- Misconduct deserves punishment;
- The public should be protected;
- Punishment may act as a deterrent, and prevent repetition or following an example;
- Punishment may correct or improve the wrongdoer.

These arguments can also be seen as conditions to be satisfied by punishment. Or more precise: conditions for the punishment actually meted out.

The opinion that punishment should be proportional to the seriousness of the wrongdoing is widely shared.

The principle that damage caused by avoidable behavior has to be compensated is widely accepted. It is a fundamental norm of civil law. Which is not to say that it is applied generally or consequently. Neither is non-application accounted for consistently. This is especially true for politicians and the higher officials of government organizations. As a rule the damage which they cause is not compensated. They are not punished, and no preventive or protective measures are taken. Neither with respect to their organization nor with respect to the responsible persons.

So there is a gap in the law which makes it inconsequent. If the indicated reasons for punishment and criminal law are sound, then the gap can be seen as part of the explanation of the continuation of the misconduct shown in the reports. If they are sound, then one may expect that elimination of the gap will result in improvement.

Centennial.

One of the episodes of the TV-series *Centennial* illustrates some of the given analyses.⁴⁸ One of the subjects of the episode is the chasing away and indiscriminate killing of Indians by the US army. The episode shows several things:

- Not everyone thinks the same about the course followed, or agrees with it. This applies to both civilians and soldiers;⁴⁹
- (Mis)conduct required of a soldier (employee) is not described clearly or explicitly, but ambiguously, with metaphors etcetera. As in: “it seems you cannot or will not deal with the situation”;
- Pressure is exerted to make people comply with behavior that is known to be unaccountable in public. If you have difficulties with compliance, it is suggested that you are not in the right place (and can better be removed);
- In judging people, much weight is attached to kindness in personal contacts, and little to integrity and professionalism in the execution of the job. ADC John Macintosh of general Laban Asher finds it necessary to correct the negative impression his boss made on Maxwell Mercy with the remark that “he really is a good man”. Whereupon Mercy says: “So are they all... They are all honorable men”;
- It is shown implicitly that the civilians and soldiers in this part of the episode are not a representative sample of the population, but the result of selection processes.

⁴⁸ DVD 2, part 4, after ca. 25'. Identification of the DVD's: Universal 825 570-6, barcode 5 050582 557060. Film © 1978. The series is based on the book of James A. Michener with the same title.

⁴⁹ Like “employees”, “soldiers” includes officers.

This may be all too recognizable. It is only mentioned as an illustration, to help the reader connect the given analyses with his or her other experiences. In theory Michener's book and the TV-series are wholly fictional. Still, it is unlikely that Michener or the film makers want to disqualify themselves by painting an utterly unrealistic picture.

6.4. General causes of false pretensions in government.

Introduction.

This report does not try to defend the proposition that governments are good for nothing. Neither does it want to suggest that in public administration nothing goes well. It does however conclude that the pretensions of politicians and higher government officials far exceed their abilities and actual performance.⁵⁰ That they are unable to do what they pretend, and don't do what they say they do or can do. They don't respect the integrity norms which the population wants and expects them to respect, nor their own integrity codes. They fail fatally in crucial duties, and do everything in their great power to keep their misconduct, errors and failures hidden. The study concludes that the given instruments for control of government do not work.

The following tries to explain these phenomena, and show their structural character and coherence.

This is an inductive section. It is based on the chapters 2-5. But the conclusions are formulated in a generalized form: references to the original context are simply dropped.

False pretensions are profitable and affordable.

The reports of the preceding chapters show widespread lack of integrity and competence. Integrity is especially violated by efforts to deny or hide the falseness of various pretensions, and to silence people who ask for honorable and competent management. Many important assertions of top government officials are incompatible with facts, or with reliable knowledge and reasoning. Many of their assertions would be untenable in an open discussion. The point is that in modern political processes, assertions need not be true, reliable or trustworthy. Inside hierarchical organizations the power provided by a suitable hierarchical position obviates the need of sound argumentation. Outside the organization a positive vote is all that is needed, and only once every so many years. Assertions can be practically imposed with the help of selective (ab)use of information and power. In parliament it is not the arguments that count, but the votes. Which in most democratic constitutional states are assured, at least in principle, by the simple fact of majority coalition government. And if arguments and an appeal to party-loyalty fail, there still remain manipulation,⁵¹ power, and (other) tricks.

Governments have plenty money to cover costs of errors. The reports show that there is no control or supervision deserving the name. Neither of efficiency nor effectivity. The organizations meant to supervise or inquire are part of the problem.

High officials, and members of parliaments and governments, are products of selection processes that only pass candidates who find the kind of practices mentioned in the reports normal and necessary (and/or profitable!), and are able and willing to participate actively.⁵² Who are willing to make false pretensions to get a (top) job. The fact of the existence of such people can be considered one of the most important factual conclusions of this study, and an essential element in the explanation of the observed phenomena. The assumption of honorable and competent governments and top managements must be considered falsified by the facts. Especially regarding integrity, the differences between people are larger and much more important than generally thought. Without these differences the described phenomena are inexplicable.⁵³

⁵⁰ Note that they practically claim infallibility without saying so. After all, never admitting serious errors is equivalent with claiming infallibility.

⁵¹ Including trading votes for contracts or between different (unrelated) proposals.

⁵² Do you know of any high government official, or member of parliament or government, who quit for any of the given reasons, and protested publicly?

⁵³ The most important missing link in the given explanation may be the discrepancy between the requirements of many top jobs and the abilities of those who are available to fill them. In other words: the impossibility of

As causes of false pretensions can be mentioned:

- discrepancies between the requirements of a job and the abilities of those who are available to fill them. That is: errors of organization;
- lack of self-knowledge (overestimation of one's abilities);
- lack of integrity;
- the idea that one can make claims with impunity (impunity eliminating the need of critical reflection);
- the wish to eliminate opponents;
- the desire to show that one is suitable, the best, and better than any other candidate, in order to get a job or more votes than the competition, in combination with one or more of the other points;
- ambition in combination with one or more of the above;
- the wish to get a law, proposal, policy, or something else accepted.

The corrupting influence of false pretensions.

Claiming to be able to do a job for which one lacks the qualifications means false pretensions. False pretensions are an inexhaustible source of problems. Last but not least when one has to account for the failures which they inevitably give rise to. When that happens, the pretender has to choose between openness and the admission of errors on the one hand, and holding on to pretensions, and talking what is crooked seem straight on the other. Admission of errors threatens one's job and career. Therefore pretenders almost always choose the alternative. The more easily if integrity is not really among their norms, or has a low priority.

Even if false pretenders would be able to evaluate people correctly, and could find people who are able to do their job honorably, it is unlikely that they will appoint them. At least as regards management functions. The reason being that honorable people dislike and oppose false pretensions. If they are not only honorable but capable as well, they are sure to become a problem for over pretentious superiors. On the other hand the necessity to hide one another's false pretensions and ensuing errors and failures creates a common interest, and a sound basis for mutual dependence.

If the top tries to avoid appointing managers and people whom they consider to be a risk for their own position, so will every other manager. In principle this mechanism will corrupt the whole organization. It may be muted by the need to keep the façade intact, by providing at least some services of sufficient quality. Salaries must be paid, in time, and the correct amounts. Compromising may be possible because corruption is not always a matter of black and white. It may have any shade of gray. However, it is an illusion to think that external requirements with respect to output guarantee anything. Many organizations and states in past and present can serve as examples. They are simply too big and opaque, and competitors may be similar or absent.

The effect of the pursuit of budget maximization by members of government and their ministries is similar to, and supplements, the effect of false pretensions. The assertion that the given budget is necessary, or insufficient, is no more than a false pretension.⁵⁴ When there is much to hide, the war for the tax receipts with the other ministries does not permit an open and critical attitude with respect to one's own policy, projects, and agencies. The war has to be supported by a positive image of everything the minister is responsible for. Preferably infallibility. Signs of mismanagement, and everything else that harms the image of perfection, hurt one's negotiation position. The battle for money requires that everyone outside the ministry thinks that the minister and ministry perform excellently and never waste even a penny. Whatever threatens this image has to be repressed or covered-up.

adequate fulfillment. Perhaps the denial of this discrepancy by the various holders of high office should be mentioned as an element in the explanation.

⁵⁴ Only the head of a firm with only a few employees could reliably make this claim.

Politicians need false pretensions, and therefore dislike transparency and supervision.

Inside a ministry, nothing is felt of any form of control or supervision by parliament, the general accounting office or whatever. This reflects the common interest of all politicians, including the members of parliament. The legitimacy of their power position requires structural deficiencies of public administration to remain hidden. Discovery would undermine the authority of politics and government in a fundamental way. Consciously or unconsciously every politician knows that he or she can impossibly fulfill his promises and his or her job, and that it is of vital importance that he is allowed to defend himself with nebulosities, half truths and tricks. It is moreover unwise and risky to judge the sitting government more severely than you yourself want to be judged when the roles are interchanged. And what politician doesn't want to become a minister? Members of parliament have an interest in a semblance of criticism and independent opinions, to keep up the appearance of controlling government and the opposition. But they have no interest in showing that many of the pretensions of politicians are false, and that taxes are much higher than necessary to realize the desired effects. It is not in their interest that it becomes known that their "control" of government is no more than an empty pretence, and does not prevent government to dysfunction on a very large scale. Irrespective of the composition of the coalition and parliamentary majority and "opposition".

The lack of serious control of government by parliament can be partly explained by lack of integrity and competence of the members of parliament, the size of modern government, and the lack of cooperation of government with controlling institutions. But there is more. The members of parliament have a good though personal reason for complaisance with respect to the government. The reason is that they strongly depend on the government for their career. It is the government who controls thousands of convenient and well paid jobs. (Which in practice are available only for (ex-)politicians). Even members of the "opposition" cannot be open, because as regards false pretensions all politicians and political parties are the same. One cannot unmask a government without unmasking politics. This personal dependence is especially strong if one has few abilities outside politics (that is: the ability of play-act and keep a cloud of balloons with false pretensions in the sky). The given systems of representative democracy are founded on the idea that the representatives depend on reelection for their welfare. On the idea that reelection is important for them. Since many decades this is an empty illusion. The future of the "representatives" depends much less on the voters they are supposed to represent than on the government and the party bosses.⁵⁵

In systems with coalition governments it is rather illogical to expect the coalition parties in parliament to be really critical with respect to the government. And indeed, they rarely are. Instead they support and defend their government; even if to keep up appearances they sometimes seem to be critical, ask concessions and even reject proposals. Which may very well have been agreed secretly beforehand.

Nothing shows the abhorrence of politicians of openness and control as clearly as their attitude towards whistleblowers and towards the misconduct that the whistleblowers made known.⁵⁶ Again there is no significant difference between coalition and opposition parties. Only a few small parties which never participated in a government seem to treat the subject of whistleblowing more seriously. But it is very doubtful whether this is more than show. Just like almost everyone else these parties pay no attention to the impunity of the members of government and officials who were responsible for the misconduct that required whistleblowing, and who tried to keep the misconduct hidden, and to silence the whistleblower. They don't propose action against people who demonstrably and structurally violated fundamental integrity norms (human rights). How can one let such behavior go unpunished if one really wants an honorable, open and responsible government, and equality before the law?

Even those politicians who say they want better protection of whistleblowers do not propose to correct inequalities in the law. Neither do they try to fill the gaps in liability and criminal law which preclude litigation against the people responsible for the various forms of misconduct which cause, if

⁵⁵ Note that the number of political jobs has grown much more than the number of members of parliament.

⁵⁶ This and the following paragraph only uses general knowledge about whistleblower cases. They do not use specific information from chapter 8.

not require, whistleblowing. So as to make the laws which outside government are said to be necessary to prevent, correct and punish misconduct, applicable to government and government officials as well. As it is, most misconduct in government and subsidiary organizations is effectively shielded from the law.

It follows that there are understandable causes and/or reasons for the observed misconduct, and that those responsible for the misconduct need not fear the consequences.

For an organization, whistleblowing about another organization is harmful.

All organizations mentioned in this study have a practical interest in friendly mutual relations. None of them has a practical interest in exposing essential deficiencies in other organizations. There often are financial interests and a need to be able to cooperate. There always is the need to appear to be a reliable partner that will not let you down. Inquiries as by governmental accounting offices often require cooperation, preferably voluntary; even if no use is made of interviews.⁵⁷ And if an organization or employee concludes that he should talk notwithstanding these interests, then he should ask himself whether his action has a reasonable chance to cause the desired positive effects. Everybody knows that this chance is very small, to put it mildly. So again: there are good reasons for unwanted conduct. Especially for lack of openness when openness is urgently needed. On the other hand behavior in conformity with professional and integrity norms can only cause problems.⁵⁸

Experience tells us that even gross government failure does not lead to structural improvement. Politicians treat the failures as incidents which are unrelated to the political system. Where possible, they try to put the blame somewhere outside politics, as after the subprime crisis, see the next chapter. They simply say that repetition is impossible since adequate measures have been taken. If necessary a pawn is sacrificed.⁵⁹ Better protection of whistleblowers will not cause structural improvement. Because it does not substantially change the causes. Better protection of whistleblowers does not or hardly change the situation of responsible politicians and their accomplices in the civil service.⁶⁰ The observed legal inequalities nonetheless mean that substantial improvement is possible. Even with real people. Although, because of their anti-social norms and values, not with the given political and administrative top. Replacement of dishonorable incompetent office holders by honorable competent people can only yield a durable effect after effective extension of liability and criminal law to political office holders.

6.5. Pointwise explanation of the observations.

This section summarizes and rephrases the preceding analyses. It adds conclusions and remarks which did not fit naturally in the above texts. It also adds causes in the field of education.

The top of public administration and false pretensions.

⁵⁷ Interviews require preliminary negotiations.

⁵⁸ Note that this paragraph argued in terms of interests. This is fundamentally incomplete and may easily yield incorrect conclusions. Not all norms and values are covered by the concept of interest. Such as openness, reliability and honesty. The paragraph moreover mentions only the “personal” interests of the organizations which are directly concerned, and not the interests of the society which finances them and for which they work.

⁵⁹ For example in the Jamby-affair and the glossy Gerda the pawn was a high official of the ministry concerned. This kind of discharge is dubious because the minister must have approved. Either on the basis of adequate information, or not. In the first case the discharge was not justified. The second case can be a consequence of a failure of the minister to manage his ministry properly. In that case too not the official but the minister himself should leave. As long as society and parliament cannot (has no right to) look inside a ministry, at least the minister should leave, and possibly the official(s) involved. If only because malicious intent and absence of oral agreements are hard to prove.

⁶⁰ In the meantime, and as shown earlier, it may be doubted if the professed improvement of the protection of whistleblowers is real, or just one more untrue and misleading political assertion.

- The heads of public administration have created a system that brings and keeps people in the top of public administration who fancy themselves far too much, are insufficiently competent for their duties, and make nothing of misleading the public.
 - Democratic political systems are characterized by competition and a permanent battle between politicians and parties (without voters' rights to full information). Chances of winning are improved by making as good an impression as possible on the people who have to choose between them.
 - The image people have of politicians and top officials is largely determined by what they, or their spokespeople or press releases say. Not by their accomplishments.
 - People do not only differ in disposition. They also have different norms and values, and different consciences. They do not only differ in unimportant respects, but also in important ones. Often the differences are larger and more important than commonly thought. On the one hand there are people who fancy that their abilities far exceed what they really can, and on the other people who underestimate themselves. There are people who think that everything is permitted to realize a certain goal, and that integrity is something of the simple minded. There are others who think that one should respect everyone's opinion and rights. There are people who think that misleading by play-acting and selective (dys)information is necessary and permitted, and other people who think that people should be informed timely, completely and correctly about what concerns them.
 - As a rule, members of government and top managers of government organizations:
 - Claim that they and their organization operate honorably;
 - Claim that they are sufficiently competent to let their organization operate effectively and efficiently;
 - Assert and promise much more than they can realize.
- Their pretensions concern both their personal functioning and their ability to realize given goals and let government operate efficiently.
- This report and innumerable other studies show that these pretensions are utterly false. None of the top managers figuring in any of the cases mentioned in this report is seen to be honorable and/or competent.
 - To keep their jobs, and to defend the given political system, politicians and the heads of government organizations must give outsiders the impression that their pretensions are justified. This is only possible by keeping honorable and competent people at a distance, and by surrounding themselves with their peers. That is: with people whose career depends just as much on keeping up appearances as their own.
 - This selection process creates an upper layer with norms and values which differ from those which the majority of the population wants and assumes them to respect. The most important values of the top layer are: a good salary and power position for themselves, and keeping up the appearance of an honorable and competent government. Integrity and respect for people play no role.
 - The mechanisms described in the preceding points imply that people who are truly honorable and more competent are kept out of the higher levels of public administration.
 - The lack of integrity and competence of the top of public administration means that governmental duties are not fulfilled properly, and that very much talent, time and money is wasted.
 - The governmental reactions against whistleblowers who reveal serious misconduct is excessive. The terroristic nature of these reactions is only understandable if the misconduct is not incidental but structural.

Budgetdefense is a source of corruption and tax increases.

- In the absence of objective norms or an authoritative arbiter the need to distribute tax receipts among government organizations has a corrupting influence. The organizations compete for money. They try to maximize their budget, and tend to claim more money than necessary. To support their claims they invent nice looking projects, make false claims about them, and hide failures and misconduct.

- The influence of the tax payer on this process is nil. He has no power. He is not really represented. As a consequence, distribution problems are “solved” at his cost: by creating budget deficits, and by creating the need of tax increases.⁶¹ Due to inadequate representation and control there is no effective counterbalance.
- Parliament stimulates this development by asking government to assume new duties as if they cost nothing, without considering the question of cost-effectiveness (and even effectiveness), and without asking themselves whether the population would still like the niceties if they would be coupled to a reliably specified tax increase. Only in exceptional cases does parliament say what expenditures should be reduced to make room for the new ones within the given budget. Moreover, costs of new duties are often if not always underestimated; not in the last place to get the proposal accepted.⁶²
- The public and the media promote a culture of false pretensions by doing as if government can be asked everything that a century ago was asked God. Again, without considering feasibility, costs and possible alternatives.

Supervision/ control is actively obstructed.

- The power of modern governments is immense. Governments redistribute and pay about half of the incomes of the population. This means that many persons and organizations depend for a smaller or larger part of their income on the government. As a consequence, many must feel that they should be careful in their criticism of government.
- The increased power of governments also means that they control the appointments for a large part of the most important, more or less public, functions in society.⁶³
- For their career perspective members of parliament depend far stronger on the political and party top than on preferences of voters.
- When governments represent a majority coalition, parliament in principle supports instead of controls government.
- This explains why parliament controls at most marginally, and why parliamentary inquiries have only very limited results, if positive.
- This conclusion is supported by the fact that virtually none of the cases in this study was discovered (and dealt with) by parliament.
- In practice parliament acts as the only judge of all important political matters. It judges all aspects of the functioning of members of government. Where no distinction is made between subjective political choices and objective questions about lying and withholding information. It is impossible to arraign a member of government for fraud.
- Investigations of organizations are often commissioned by themselves. As a rule, they control both the inquiry and the reporting of the results.
- Inquiries which are (partly) based on interviews need the cooperation (and integrity) of the organization and people involved. This precludes reliability and openness.
- The inquiries mentioned in this study were rarely if ever independent.⁶⁴
- Selection of investigators (including members of inquiry commissions) can ensure “formally independent” to actually mean a strong bias in favor of established interests (which are to be investigated). For example by choosing people who have shown this bias before.
- Because of their responsibility, top managers bear at least part of the responsibility for failings exposed by investigations of hierarchical organizations. Since publication of the report needs the signature of the top, this causes underreporting of abuses. It follows that as a group, inquiry reports give a too rosy picture. It is not known however by how much.

⁶¹ N.B. This was written before the outbreak of the second financial crisis, the (government) debt crisis.

⁶² Another mechanism for budget deficits and tax increases.

⁶³ In the Netherlands, the articles 1 and 3 of the constitution state that most of the functions meant here should be open to everyone. Practice shows systematic violation of these articles. But the Dutch constitution does not provide means to assure compliance.

⁶⁴ Causes were mentioned earlier.

- Mutual dependencies between the investigating and investigated organizations cause silences which can easily prevent necessary improvement and correction.
- Internal systems of control are not independent but part of the hierarchy. The top can use the system to better keep up appearances, since outsiders tend to trust the integrity and professionalism of for example auditors. Whistleblower regulation is utterly inadequate, and is not accompanied by rules for the adjudication of those who are responsible for the abuse which justified whistleblowing, and for the need to litigate. The cost of the abuse and the cost of the defense of the abusive managers are paid from the tax receipts.

The law practically safeguards government officers from liability and punishment.

- There are no practically meaningful instruments for bringing dishonorable and incompetent members of government and principal officers of governmental organizations to justice, to get them judged by an independent judge, and where applicable to hold them liable and get them punished.
- The subordination of the prosecutor's office to the minister of justice is part of the deficiencies of the legal system. It facilitates foregoing prosecution, and prosecution for appearance's sake.
- This is amplified by the absence of a duty of the public prosecutor to account at least annually for its policy and for what it did and did not.
- There is no organization with the duty to find and prosecute abuse in and by government organizations, or any other organized effort with this purpose.
- Members of government can only be held to account by coalition members, and top officials of government organizations only by their minister. In both cases the two parties cooperate(d) on a regular basis, and depend on one another for their careers.
- The more incompetent a minister, the stronger his or her dependency on the ministry, and on the loyalty of the top of the ministry. Ministers have very good reasons to protect the subordinates in the ministry with whom they communicate regularly.
- It follows that there are two kinds of justice. People are liable for damage caused by activities outside the (semi) governmental sphere, and punished for crimes and misdemeanors in the same area. They are judged by an independent judge. Damage caused by employees of public administration or related organizations is not recovered by those responsible, but by the taxpayer. Misconduct of members of government and their top officers is punished only very rarely. They are judged within the political system, in principle by parliament.
- Note that the law was made by the people who are protected. The given situation can therefore be interpreted as a successful effort at self-protection.

Education gives an incorrect picture of reality, and offers an inadequate basis for understanding and discussion of government, and participation in public choice.

- Education about man and society is theoretical and idealistic: it shows how it should be, not how it is. Because the social climate suggests that we live in the best of all possible worlds, because to young people the theory seems self-evident, and because nobody gives a coherent description of reality, education suggests that reality agrees with the ideal.
- As a preparation for reality, education is insufficient. It does not give the knowledge and does not develop the abilities needed to be able to survive working honorably and competently in large (hierarchical) organizations.⁶⁵
- Education prepares insufficiently for participation in a society with a government which spends about half of the sum of the incomes of its population.
- The education of the members of government and the top of government organizations is just as deficient.
- That of journalists too. They lack knowledge, understanding and know how which is essential to function properly as a journalist. In addition they are or make themselves dependent on the people and organizations they want to write (critically!?) about.

⁶⁵ Supposing this to be possible. In a criminal organization it is definitely impossible for example.

- Most people are not aware of what could be regulated differently. Many people wrongly believe that society cannot be organized better. They don't realize that already something as simple as extension of the law for ordinary people to government officials would greatly reduce misconduct as described in this study.
- Important gaps in education are: knowledge about the reality of the internal functioning of organizations like a ministry, the laws that are of interest to everyone,⁶⁶ and the science of decision making.
- Information and learning cost time. Therefore it is difficult to make up for gaps in education after leaving school. This causes an almost vicious circle.
- The above explains why insufficient accounting is requested of politicians and government officials, and that the account given is not judged competently.

The conclusion is that there are many systemic properties, circumstances etcetera which cause and maintain corruption of the top layers of public administration. There are no significant counterforces. Present law makes repression of potential counterforces easy. The corrupt system is therefore stable. As recent history shows, it can even withstand the larger shocks caused by wars and financial crises.

6.6. Why conventional solutions won't work.

Introduction.

Someone who read the chapters 2-5, and knows that the work of subordinates in a ministry is strongly conditioned by their superiors, will conclude that an active attitude of the secretary-general is conditional to realize compliance with a code of conduct. Of course, this is one of his formal duties. He has the authority to fulfill this duty effectively. Although not even a reminder should be necessary for an honorable and competent SG, some people will recommend that one should speak with him. On the basis of the (falsified) axiom/ norm: everything is solvable by talking, and/or should be resolved by talking. The following section shows that talking with people with characteristics and histories like this SG is worse than meaningless. It is a recipe for losing valuable time, energy and money.

Talking always costs time, but does not always yield solutions.

In many circumstances, talking and discussion are useful, necessary and efficient. But in the cases presented in this report it is simply unreasonable to expect anything positive from them. Both the reports and the analyses prove that talks with the given top officers is just a waste of time and energy, and may easily elicit repression and cover up. In 2007 the SG was informed about the course of the policy portal project. He was asked to uphold the code of conduct of the ministry. In the following two years he, the uSG, and the education DG's were kept informed, and were asked repeatedly to straighten matters out. But although their words seemed to indicate a helpful attitude, they did nothing to stop the misconduct, and constructed a web of lies to prove that nothing was amiss. They did not explain their (mis)conduct or anything else. For a long time they claimed that further investigation was necessary before they could act. Apart from that they just denied any wrongdoing. They were authoritarian, and never discussed anything in an open way. In short: the appeal to the appropriate authorities was worse than useless: it only caused more misconduct. A cooperative attitude and patience were simply abused. This and other experience shows that the management of the education ministry considers the code of conduct not as a set of norms and values to be complied with, but as a public relations instrument. As an instrument to mislead ignorant outsiders into believing that the ministry can be trusted to work according to appropriate norms and values.

Talking makes sense if the interlocutors are (truly) well meaning and honorable, and have the required competences. The reports show that the top of the education ministry and other top managers do not satisfy these conditions. They consciously and intentionally violate their own code of conduct. The reports show various efforts to cover up misconduct, and to silence those who report misconduct

⁶⁶ Such as the constitution, civil law, and criminal law.

and ask for correction. They show no efforts to end the misconduct. The reports are as many warnings against talks on the basis of trust.

The possibilities and failure of integrity officers.

This section presents conclusions of the time the author was still thinking in terms of recommendations, and in terms of solution with the help of integrity officers. Further study led to the conclusion that more fundamental systemic changes are necessary, and that systemic changes cannot be realized by integrity officers. The integrity officers nevertheless could have done much more than they actually did. This section shows what and how, and that their negligence and false pretensions made them part of the problem. Their existence wrongly suggests the existence of a system that actively protects the integrity of the organization.

In the first place it is important to note that integrity officers have access to the top of the ministry. They can request to talk with it. They publish an annual report in which they can say what they want, at least to a certain extent. To a certain extent only, because it may be assumed that they do not want to spoil their good relations with the top. And I suppose they can only publish the annual report after approval by the SG.

An SG may gain time by making promises. He can propose “independent” investigations. As long as such proposals are accepted by the integrity officers, he has nothing to fear. Moreover: if the integrity officers are unwilling to draw conclusions from what they know (and unwilling to trust those who appealed to them), they may be willing to be kept on a string indefinitely. With a good probability of gradually losing interest. The management will gratefully use such opportunities.

Integrity officers could confront the SG with facts selected from the reports. They could ask whether he wants to deny them, defend them, or whatever. The SG may be expected to reply that nothing is seriously wrong (any more), and that if something went wrong in the past, he has already taken adequate measures. He will point to the fusion of IAG and IFC and other organizational changes (which he will call “improvements”). The integrity officers may object that the changes are clearly visible, but that the improvements are not. They can give as their judgment that the following facts are incompatible with the hypothesis that everything is already going as it should:

- The people responsible for misconduct and failures kept their functions, were promoted, or got another responsible function;
- The management has never explained the course of events, and justified its actions and omissions to those who reported the misconduct, and have suffered from it;
- It has not even acknowledged that the conduct was not in agreement with the code of conduct of the ministry. Not towards those directly involved, and not towards the ministry, IAG and IFC. It is therefore unclear how people can know that the old abuses will not be tolerated any more. It isn't clear either what consequences misconduct will have in the future. Nothing has happened that removes the impression that supposedly unwanted behavior is rewarded, and complaints about it will result in one form of repression or another.

In the annual report the integrity officers can declare that in their opinion this is contrary to the code of conduct of the ministry and the integrity policy of the government.

The points are of fundamental importance because they give the reasons why employees of the ministry have the idea that the code only exists because there has to be a code, and to keep up appearances; but that in actual fact ignoring integrity and professional norms is rewarded by the top. Both the code and the OPIPA documents require the top to set an example.⁶⁷ They do, but they set the wrong example.⁶⁸

The integrity officers can tell the SG that they will discuss matters in their annual report. In the annual report they can describe the most important types of integrity violation, give examples, and observe that as far as they can see no corrective action has been taken. They can conclude that the violations seem to have a structural character. They can say that in their opinion the violations have

⁶⁷ OPIPA= Office for the promotion of integrity in public administration. See chapter 4.

⁶⁸ «The managers have a specific role. They are expected to show good exemplary behavior. Managers should be aware of this, and be open towards their subordinates about the ways in which they act in certain situations». Which they obviously don't do at all.

important harmful implications for the organization. Both with respect to the work climate, human resources policy, and accountability of expenditure.

In their annual report the integrity officers can propose the SG to supplement the code of conduct with examples taken from practice as described in the chapters 2-5. For example about the meaning of “respect”:

- Send documents which are to be discussed or used in a meeting well in time to the participants. Say at least a week in advance. If the meeting has to be prepared by subordinates of the participants, or if topics have to be discussed in the organization units of the participants, they should be given even more time;
- If you request contributions for something, inform the contributors about their use. For example by means of the minutes. And if this cannot be sent in a reasonable time, by other means.

Of course these points can also be classified under “responsible practices”. For what the points request is also necessary for an adequate material preparation. As a matter of professional conduct.

“Respect” is only one example. For other examples the reports and the conditions to be mentioned below can be used as a source of inspiration.

The integrity officers may conclude that they have insufficient instruments to effectively correct the misconduct discovered. They could try to develop proposals for more effective duties and authority for themselves, and for improvements and supplements of the code of conduct. They could discuss the duties and authority of integrity officers, and the lack of integrity of the top of ministries, in an interministerial framework.

In a general way, the annual report could note that false pretensions are incompatible with integrity and professionalism, and that they are a source of various other threats to integrity and professionalism. For that reason it could request persons, especially politicians and top managers of government organizations, to be more modest in their goals and about their competences.

The code of conduct should pay attention to honorable and professional handling of risks. Especially to, and because of, the risk of project failure and accountability with respect to the tax payers. The code should make recommendations about the responsible handling of risks. More often than not, a problem with risk management is the absence of mechanisms which make it attractive for decision makers to weigh pros and cons objectively, and to take not only all possible benefits into account, but also all possible costs (including risks). Both false pretensions and the absence of personal liability invariably cause costs and risks to be ignored, or underestimated far too much.

Underestimating costs and risks can be seen as part of the policy of budget maximization. To prevent it, no risks should be taken which cannot and will not be paid out of the structural budget. The integrity officers could recommend the formulation of rules for the honorable management of risks. Because of the great and general interest of “risk”, this topic should be discussed government-wide. Of course the rules should be accompanied by proposals for checks. For example in the form of liability, sanctioning, and/or supervision.

As in other jobs which one starts without prior experience, the job of an integrity officer may turn out to be more difficult than one has been told and expected. It may exceed one’s abilities. When this applies, the honorable reaction is to admit it, to resign, and to explain why this is done.⁶⁹

It is pointless to ask people to change themselves radically.

⁶⁹ The argument that your job will be taken over by somebody else, and that you may actually be relatively good at it, is a fallacy because unproven, can be used by everyone, and can be seen as a primary cause of the phenomena described in this study. Giving in to the argument creates a society in which people systematically do things they can not properly do, and in which they maintain a system which they cannot maintain in a proper way. It creates (created!) a society in which there is a structural discrepancy between abilities and duties. What was called “as good as possible” has too often been found to be insufficient.

Apart from other reasons, when you reflect on what talks should produce, it quickly becomes clear why they make no sense. The SG and his close associates are almost perfect models of contradictory words and deeds. The facts show that the SG very well knows what is expected of him, but acts as if he doesn't. He would have to change himself radically, and change his character too. He would have to acknowledge that he made many important "mistakes", structurally, during a long period of time. To become credible he should specify the mistakes. He would have to acknowledge that the top of the ministry has not reacted properly to misconduct, but instead tried to cover it up. He would have to admit having given auditors orders which required them to violate their professional code. The SG would have to take credible and drastic visible action. Also with regard to the management. For as long as mismanagers keep their positions, and he himself remains SG, his declarations will meet with justified cynicism. Nobody will believe that anything will change. The employees of the ministry (of any ministry, if not any organization) have seen "improvement programs" before.

There is not the least ground for the assumption that people like the SG and uSG are able to radically and sufficiently change behavior that they have shown for years. Neither theoretical nor empirical. The necessary changes in behavior have never been seen anywhere before. They could easily be physically and/or psychically impossible. A minimum of equal rights moreover requires that the top does not get better opportunities than any other lawbreaker, let alone people without any criminal record. So as far as we know, the necessary change probably is impossible. And even if it were possible, consistency and credibility require removal of such people from public administration.

It is illogical to expect self-correction of a ministry.

In the policy portal project, the SG and uSG were told that an integrity officer was kept informed of the course of events. From other people too SG and uSG knew that several projects and activities did not run as well as the IFC managers reported. SG and uSG could have seen and tried the policy portal on their own PC, and easily. In the summer of 2007 the author told the SG that he preferred the ministry to correct itself, without external interference, instead of filing a formal complaint. In the following years, the SG and uSG have shown that his hope was vain. They showed that they are part of the problem, and the most responsible part. They have shown that they think they have nothing to fear from integrity officers, and much from revelations about their misconduct.

It is furthermore clear that the DG's responsible for the projects had been kept informed just as well. But it seems that they took the SG as an example. They shared or adopted the norms of their superiors, ignoring everything else.

On the basis of the analyses it has to be concluded that replacement of the top by kindred people cannot bring improvement. The system doesn't create the wrong people, but selects them. It rejects honorable and competent people, and retains the unsuitable ones. Replacing an individual by someone similar doesn't change the mechanisms. The results of the analyses are supported by the empirical evidence. Which tells us that replacement does indeed bring change, but no significant improvement.⁷⁰ (Self)Correction would require explanation and openness, and bring to light that the top is insufficiently competent for its job. This is contrary to the top priority of the top: keeping up the appearance of perfection, and of course its personal interest.

Conclusion.

Since control and correction of organizations are conditioned and regulated by laws which apply generally, and since the most important institutions which supervise public administration organizations have a duty with regard to many or all government organizations, it would be a miracle, if not logically impossible, that phenomena as described in the chapters 2-5 are limited to the (Dutch) education ministry.

Because of the general nature of the causes identified in the analyses, they must be present in most or all government organizations. A conclusion for which support is easily found. At the time of writing

⁷⁰ This has the same reasons as the phenomenon noted by Tolstoy in the first sentence of *Anna Karenina*: happy families are all alike; every unhappy family is unhappy in its own way. At best there are only few options to do things right, and there is an infinite number of things one can do wrong.

the disastrous failure of the risk management of the North-South metro line project of Amsterdam and the subprime crisis may be the best known examples. But the most telling support comes from the excessive government reactions to whistleblowing. Of which the excessiveness can only be explained by their reasons not being incidental but structural.

On the basis of the phenomena and analyses described and given above it has therefore to be concluded that correction of public administration is impossible without vigorous intervention by the outside world. If it is to have the desired results, it should be based on a reliable picture of the true state of affairs in a ministry like the Dutch education ministry. This is necessary in order to eradicate illusions which prevent solution of the problems. But though such knowledge is necessary, it is not sufficient. Better knowledge of the facts is only meaningful if it is known how structural misconduct can be terminated structurally. It should be kept in mind that most people in power can only keep their position by dishonorable means. They have a great interest in the failure of efforts at structural improvement. This underlines the importance of a blueprint for legislation with a preventive effect with respect to unwanted conduct in government and politics.

In the following section the analyses given above are translated in conditions for a more honorable and competent public administration. They are called conditions and not recommendations or proposals for a reason. The reason being that failure to satisfy the conditions is equivalent with approval of dishonorable or otherwise unprofessional behavior. Failure to satisfy the conditions is contrary to generally accepted principles of law, or their premises. An honorable government tries to formulate and promulgate honorable laws. Such laws require consistency and consequence. Especially in liability and criminal law, and in the administration of justice. Finally they are called conditions for a logical reason: they are supposed to be part of “if..., then...”-propositions. Recommendations and proposals are not.

6.7. Conditions for honorable government.

Introduction.

The reports and analyses show that integrity violations do not have a marginal but dominating negative influence on the operation of the organizations concerned. The existing systems for control and correction are utterly ineffective.⁷¹ The reports do not only give a picture of the operation of the education ministry, IAG and IFC, but of other organizations too. They show that none of the top managers appearing in any report considers integrity (respect, honesty and openness) as a boundary condition. All inquiry reports which passed in review gave an incorrect and too rosy picture. None of the top managers ever protested against misconduct, or spoke openly about it. Which shows that replacement by kindred people makes no sense. Solutions have to be found in very different directions.

The conditions to be mentioned below are based on comparison of information of two kinds. On the one hand information about the actual treatment of misconduct in politics and government. On the other hand information from (other) areas of social activity and law. The comparison is supported by evaluation of the reasonings underpinning the relevant laws.

In general the conditions are self-evident. There are logical relations between them. Some conditions need to be satisfied in order to be able to satisfy others. It will be obvious that failure to satisfy a given condition is incompatible with integrity and professionalism. In other words: that a correction program is only credible if it adopts the complete set of conditions. To the author, the probability of incompleteness of the presented set seems much greater than the probability that conditions can be dropped without causing risk or harm. As long as there are meshes there will be fish slipping through. Where it should be realized that in this case the fishes that escape are not the fry, but the biggest and most harmful ones. In almost all cases, rejection of conditions means choosing in favor of dishonorable and dangerous conduct. It may nevertheless be useful to distinguish between:

- Necessary and logically sufficient;

⁷¹ So much so, that one wonders whether they were instituted only for appearances sake. Like codes of conduct.

- Useful and necessary, but insufficient.

If only as a warning. The insufficiency of the second class is argued as a preparation against political blah-blah suggesting that they are sufficient.

Conditions which are necessary and possibly sufficient.

The main idea is very simple, namely equalizing the treatment of behavior which causes similar harm. Irrespective of the context of the behavior, and irrespective of the function of the actor (or omittor).⁷² As noted earlier, at present there are two separate systems of law and adjudication. The one of politicians judging politicians and their subordinates, and the other of judges judging other people and organizations. This dual system should be replaced by a system with equal treatment of all norm violations which cause avoidable harm for other people. In other words: "the political exception" is to be abolished. To some extent, consequent law obviates the need of external supervision. But not completely, since there is no certainty about the preventive effect of the law. Prevention is of paramount importance when consequences of misconduct or errors are irreparable and large. The only known solution is supervision. Obviously supervision too must be liable and punishable. It should do what it is meant to do. There should not be responsibility without liability and punishability.

By definition, misconduct is avoidable behavior that is incompatible with norms of integrity and professionalism, and/or causes harm.

The conditions are the following:

1. Everybody is personally liable for harm caused by his avoidable activities or omissions, or which are incompatible with one's duty, with integrity, or applicable professional norms. The actions and omissions include reactions to signals.
Rejection of this condition implies permission to roll off costs on people who may expect functioning in accordance with duty, integrity and professional norms, and who had no part in the decision making.
2. In so far as an actor cannot properly repair or compensate the damage he has caused, his misconduct is punishable.
3. Behavior which is incompatible with duty, integrity and professional norms is punishable if it causes the risk of irreparable damage or damage that cannot be compensated by the actor(s). This also means that public declarations may make one liable and punishable.⁷³
4. Misconduct may show unsuitability for functions in public administration. Where this is the case, punishment should therefore include exclusion from public offices.
5. Information about the operation of governmental organizations is public unless publication would cause disproportionate unjustified harm to innocent people. Which is to be proven by the organization concerned.
At present the prosecution and punishment of leaking is utterly disproportional to the virtual impunity of untimely, incomplete and/or incorrect information in the framework of public decision making. The disproportionality undermines the legitimacy of a democratic constitutional state because democracy presupposes timely, complete and correct information of the voters about everything regarding public administration that may affect their voting behavior.
6. All this to be judged by an independent honorable and competent judge. Judges should have (had) no relation with politics whatsoever. In particular they should not be selected and/ or appointed, directly nor indirectly, by or through politicians or any government related organization.⁷⁴
7. When a hierarchical organization has to pay damages as a consequence of misconduct, everyone in the responsible hierarchical lines has to contribute an appropriate share. For the sizes of the shares a distribution default and/ or general rules should be developed and published. A default

⁷² An omittor is someone who omits to do what his or her duty requires.

⁷³ The freedoms of a citizen may differ from those of an official who has a function which brings duties.

⁷⁴ To avoid misunderstanding: this also applies to the highest judges.

- rule might be: an equal share for everyone in a given hierarchical line, from the lowest level involved to the very top.⁷⁵ The sharing reflects the character of a hierarchical organization.
8. Agreement in group decision making means sharing liability. Agreement with the group decision is presumed unless disagreement is proven. The distribution default and general rules are applied unless someone proves that this means a disproportional assessment.
 9. Misconduct causes all kinds of unwanted risks, if not direct harm. Therefore reporting misconduct is obligatory. In the first place internally. If no effective action is taken within a month, anyone knowing of the misconduct is obliged to report to a judge. Non-reporting is punishable.⁷⁶
 10. Not reporting misconduct one should know about makes liable and is punishable. This gives employees an interest in working honorably and professionally, and to report misconduct. It makes misplaced loyalty risky (and therefore costly).
 11. Legal assistance of parties should always be equivalent. This may require one party to support another, or to employ cheaper lawyers.
 12. In litigation of government against whistleblowers it is presumed until proven otherwise that both parties may be representing the public administration. The financial support of both by the public treasury should therefore be equal.
 13. If the judge declares that the whistleblower is right, this should lead to correction, and to payment of damages by, and punishment of, those convicted for misconduct (costs should not be paid by the public treasury);
 14. In the first place, punishment should be effective as regards its goals. In the second place it should be proportional. The reference frame for proportionality should be published and easily accessible;
 15. Because of the potentially very large consequences of government activities and omissions, misconduct regarding decision making about public affairs has to be punished so severely that it may be assumed to be sufficiently preventive.
 16. Members of inquiry commissions and investigators are personally liable and punishable for the consequences of misleading or incorrect reports. Such as payment of the costs of continuation of a project that should have been terminated.
 17. Investigations of the functioning of parts of public administration should accept integrity and applicable professional norms as (inviolable) boundary conditions. The same applies to the reports of the investigations. In case of noncompliance, a corrected report should be published, and the old report replaced free at request, at the cost of those responsible for the norm violation(s);
 18. Every citizen is entitled to all information about the operation of the government that may be of importance for deciding his vote. The information should be timely, complete and correct. A complaint about incorrect or misleading information can be submitted to a judge. If the complaint is found to be justified, further distribution of the information is forbidden. Those responsible are obliged to produce a corrected version, to publish it in the same way as the rejected version, and to accompany the new version with a description of the changes. They are liable for the costs, and punishable.
 19. Similarly for information that is relevant for decision making about public affairs.
 20. People and organizations respect integrity (also) when reporting about their abilities. Which often means that they will be much more modest.^{77, 78} They make no false pretensions. Their subordinates cannot be honorable and professional if superiors request the impossible, and want everyone to keep up the appearance of success, irrespective of reality.
 21. All participants in public administration accept integrity (as defined at the beginning of chapter 4) as an inviolable boundary condition. This also means openness about costs (including risks) and

⁷⁵ An equal share may mean: an equal percentage of income. (How could such punishment not be legitimate if taxation is?)

⁷⁶ In a hierarchical organization this is not an empty obligation, since it is well known what positions people had in a given period. Moreover, superiors must be presumed to know what their subordinates do, unless they can prove otherwise, and unless they show that they need not have known. Not knowing is no excuse. No one should accept an impossible job.

⁷⁷ And do not pretend to be able to select the manager of an ICT or inquiry project if they don't know anything about ICT or research and science.

⁷⁸ Modesty and risk aversion are two different things.

benefits. Policy papers do not one-sidedly stress supposed benefits, but openly discuss costs, risks and potential negative effects as well. Criticism is taken and treated seriously and professionally. In general, justified criticism has consequences. Failure and success differ: a failed project was not successful. The infallibility of members of government has ended. Government officials do not only defend their pre-occupied positions, but listen, reflect, and improve or correct (change!) their ideas.

It will be clear that the measures implied by these conditions will have a preventive effect, and that it may be expected that after some time people have adjusted, some people were replaced, and the number of lawsuits against measures becomes negligible.

Useful and necessary, but insufficient due to lack of incentives.

The following recommendations are necessary but insufficient. Still, they contribute to the realization of the goal of an honorable and competent government.

1. Appoint only people of proven integrity in functions in government organizations (including members of government).
2. Give people only functions for which it can be assumed with good reason that they have the required abilities. Qualifications like “better than all other candidates”, or “as good as possible”, are insufficient.
3. Managers should be able to judge whether subordinates can do what they are required to do. People who lack this ability should be given jobs for which they do have the necessary abilities.
4. People should be stimulated to improve their self-knowledge: the knowledge of their character, abilities, limitations, and weaknesses, such as pretending more than they can realize.
5. Managers should keep in touch, and manage actively when things don’t seem to go well of their own accord.
6. Improve the independence, possibilities and authority of those who supervise compliance with integrity and professional norms in government organizations. They should not be headed by (ex) politicians. Supervisors should be given the additional duty to track down integrity violations and other unprofessional conduct. Their findings should be made public.
7. Project plans should include plans for reactions to problems arising in the course of time. Including financial problems. There should be an exit strategy, offering an alternative for keeping up appearances. Continuing an impossible or badly underestimated project should be less attractive than stopping.
8. A new activity or project should be preceded by a reliable⁷⁹ feasibility study and risk analysis. Feasibility has a practical and theoretical dimension. A practical question is: do we have the necessary people, money and time?
9. Admit as soon as possible that a goal was too ambitious. Where applicable, explain why the problems or their size could not have been foreseen, or only as a risk. If meaningful submit an amended plan, or propose discontinuation.
10. Acknowledge errors. If incidental, show why. Show what has been done to prevent repetition, or to reduce their probability. Show why the measures are credible. Of course, if the errors were manifestations of incompetence, other conclusions have to be drawn.

Realization of these recommendations would mean an important step forwards. Major shortcomings are the lack of provisions for compensating harm inflicted, and the lack of permanent incentives for really doing what is required, including lack of adequate supervision and sanctioning of non-compliance. The reports show that it is easy to comply on paper, without really doing what is

⁷⁹ Those in the Dutch education ministry were not reliable at all. Underlining the remark that these measures are insufficient. It should be made impossible (very costly) to pay no more than lip service to these measures.

required, and without the least positive effect.⁸⁰ Keeping up appearances by trickery only makes things worse.

All of the above points are well-known. If they were ignored structurally for more than 10 years, why should one expect them to be respected as from now? Just because they are mentioned one more time?

What may help, but will not produce any fundamental improvement.

1. Promote open discussion of everything discussed in this study.
2. Promote awareness of the meaning and importance of integrity in work and organizations.
3. Promote self-knowledge, of (limited) abilities, and weaknesses, such as pretending more than one can realize.
4. Promote awareness of threats to integrity. Such as arise from overestimation of ones abilities, and from underestimation of the tendency to please superiors, even if they act dishonorably or unprofessionally (misplaced loyalty).
5. Promote integrity as an inviolable boundary condition. Instead of a luxury to be respected “as much as possible”.⁸¹

These points are referred to as recommendations.

Credible implementation of these recommendations requires integrity and abilities. Credibility requires for example that the values presumed by the recommendations play an essential role in performance appraisals. Declarations claiming a desire of fundamental improvement are not credible if people who structurally acted contrary to these values are left in place. The reports of the chapters 2-5 clearly show that at least in the years 2005-2010 everyone in the top of the education ministry failed to pass the test, and even actively obstructed compliance.

The example and common sense indicate that implementation of the recommendations will cause serious tensions. Mainly because the whole top of public administration and politics is corrupt: dishonorable and incompetent. Their false pretensions are an integral part of their “personality”. Without false pretensions they never would have obtained their actual positions. Given their character, it must be assumed that they will oppose durable improvement by all possible means.

And don’t forget that the law is made to allow a corrupt top to stay in power. Durable improvement is impossible and incredible without fundamental and far reaching adjustments of the law.

Radical improvement of education.

Education should be supplemented by:

1. Knowledge of those parts of the law which are of importance for everyone.
2. Explanation of the ways the law tries to limit certain kinds of misconduct and to reduce its harmful consequences.
3. Discussion of the motivation for the law: explanation of why it is as it is, and not otherwise.
4. Description of important differences between the laws of different countries, and explanation of these differences.
5. An outline of the history of the law, here and in other countries.
6. Discussion of possibilities, limitations and criticism of the law.
7. Information about practically relevant differences between people, and of the danger of the assumptions that everyone is reasonable, has a similar conscience, and “ultimately” thinks alike (or the same).
8. Discussion of the social consequences of the properties of people, and of the spectrum of

⁸⁰ A clear and simple example is the formal instruction of uSG to adopt Prince2 (a method for project management). She herself immediately started making important exceptions. Nobody took the instruction seriously, and uSG did not supervise implementation.

⁸¹ To be honorable it is not sufficient to have the best intentions, or to do ones utmost. One is only honorable if one satisfies the integrity requirements listed in section 4.3. Not partly, but fully.

- properties, on important events in the course of history, such as wars and crises.
9. Training in information management. Including evaluation of information. Making aware of the fact that kindness displayed at teatime says nothing at all about people's integrity and competence on the job, and that our image of the state of the world is strongly colored by large and permanent streams of one-sided government "information" (propaganda) which dwarfs all other information taken together, and makes it very hard to get a reliable and well-balanced picture.⁸²
 10. Teaching to distinguish between different kinds of statements and texts, for example, fact, opinion, news, explanatory analysis, implication, and summary.
 11. Showing and explaining that independent analysis is rare, while self-censorship and unthinking acceptance of whatever is the norm in one's environment are common. Showing how the dangers this poses can be reduced.

Where necessary to create space or time, outdated or overweight parts of the curriculum should be dropped. Efficiency can be promoted by the combination of (new) subjects with language education, and concurrent pruning of less relevant "literature".

Some useless measures.

There are also "measures" which are no more than efforts to suggest the best of intentions, while actually meant to leave things as they are. They are mentioned because they will undoubtedly be proposed by people who don't want to go "that far" (as in the lists above). That is: by people who don't want to go as far as necessary to be effective. These measures are even softer than those in the third set given above, under the heading "What may help". If implemented effectively, they may have a positive effect. But without accompanying measures ensuring effectiveness, this is no more than falsified wishful thinking.

1. Improvement of existing integrity and/or professional codes of conduct. This will not help, because in hierarchical organizations there is no separation of powers, and because codes are noncommittal. There was little wrong with the codes in the first place. Compliance is judged by people who are responsible for the conduct to be judged. They are not independent, and have an interest, but not in compliance. Judgment by the top furthermore presumes integrity. The chapters 2-5 show that this presumption is unreasonable: the top has too many reasons to shun openness, honesty and other forms of integrity. Codes would substantially restrict its freedom of action. Summarizing: the problem with the codes was not their content, but the lack of supervision of compliance, and of sanctioning of violation.⁸³
2. Improvement of whistleblower regulations. Indeed, at least the Dutch regulation offers ample room for improvement. And Edward Snowden is living proof of the absence of meaningful whistleblower protection in the USA. Dutch regulation offers very incomplete protection, causing litigation to remain highly unattractive for the whistleblower. The regulation is heavily biased in favor of the management. The management does not run any risk of personal costs. The whistleblower does. Therefore, the management need not fear litigation. Moreover, litigation can only start after an internal procedure of years, adding to the bias ("man against organization"). In other words: the regulation discourages whistleblowing, and has no preventive effect against misconduct in the organization. It presumes the innocence of the management, and says nothing about the consequences to be connected to the verdict that this presumption was incorrect. So improvement is possible and might help. And the credibility of proposed improvements can be judged with the help of the points mentioned here and earlier.

The reports show that the codes and regulations utterly failed their (pretended) purpose. Not just a little, but completely. As regards the codes, the reason is only too simple: there is no independent

⁸² As will be seen in chapter 9, this should be supplemented by biased journalism and the legal bias due to libel laws and the like. There being no restrictions on "positive" information.

⁸³ Of course, creation of a really independent and effective judgment system- outside the organization- could mean real improvement. And will therefore meet with much more resistance.

system for tracking down violations, and for prosecuting and judging violators. Violators are not punished. In short: the codes are no more than paper. As regards whistleblower regulations: they are biased to such an extent as to make them useless (or harmful!) in most important cases. Therefore, there is no reason to believe that minor improvements will be of any use.

If substantial positive effects are wanted, fundamental improvements are necessary. The equality and safeguarding principles, and consequent law, all require general applicability of liability and criminal law.^{84, 85} If this is done properly, codes can be done away with. Society still needs to encourage whistleblowing however, as an early warning system. Nobody can see and understand better what happens in organizations than insiders, and organizations can easily cause harm that cannot be repaired or compensated by the people who are responsible for it. Which makes early warning a necessity, even an obligation. Even more than chapters 2-5, the cases presented in the chapters 7 and 8 show that the importance of true openness of (public) organizations cannot be overestimated. And if prevention is more important than reparation, it is crucial that people in organizations are made personally and effectively liable and punishable.

Why the transformation to an honorable organization should not be managed by the sitting top.

One might suppose that part of the measures or recommendations can be implemented by the given management. It can not. The facts are, that the management knew what was wrong and what should be done, and that it had years to realize improvements without any loss of face. But it didn't, and actively obstructed efforts of others. It found it more important to keep up the appearance that everything was already perfect as it was. That it made no mistake. It proved that it is insufficiently honorable and competent. Nobody in the management has ever shown "deviant" (= honorable and competent) behavior. In other words: these people have shown beyond any doubt that they are unfit for their job.

A project for the gradual development towards better government organizations directed by the given management is therefore incredible, to put it mildly. It is impossible that such a project will have the desired effect. The experience of many years has shown that promises of the given managers cannot be taken seriously. They had plenty opportunities to prove their integrity and competence. But refused to when they were free to choose. Should one believe their seriousness when failure to make promises can cost them their job?

But allowing these people to keep top positions is not only stupid. It would also be completely contrary to what are generally considered sound and normal selection criteria. It is good practice to require proof of integrity and competence. But in this case people would be kept notwithstanding proof of unsuitability. This is no less than gross injustice towards everyone who never got the chances the sitting management got (took).⁸⁶ So the project not only lacks credibility, but is also unjust. It implies a lack of just punishment, and extremely unequal treatment as compared all other crimes. What is really needed is the complete removal of all responsible managers from public administration.

As regards an organization like the Dutch education ministry: a clear and radical break with the past is an absolute necessity to convince the employees that the future will be really different. They have been exposed to too many empty promises already. The top management should be removed, and all other managers at least demoted, with corresponding loss of salary. They could not what they pretended, and failed to act honorably (and/or in accordance with their own code of conduct). They should have known, and concluded as much from the events. The reports show that the following persons were not only formally responsible, but actively contributed to continuation and spreading of misconduct: Koos van der Steenhoven, Simone Roos, Rob Kerstens, Ineke van Oldeniel, Steven van Spijker, Frank van Loon, Lex de Lange, Femke Aarts, and Ed Smid. They actively tried to silence and sidetrack people who protested the misconduct. Retaining such people shows that integrity and competence, and by implication accountability, are considered unimportant. And that violations have no serious consequences.

⁸⁴ For the safeguarding principle see part B of chapter 7.

⁸⁵ And procedural law that has the same boundary conditions: no costs for innocents.

⁸⁶ In fact, the analyses suggest that the sitting management may be supposed to have blocked access of honorable and competent people to management functions.

Because of the generally available evidence about whistleblowers in public administration, the absence of whistleblowers in many cases where they should have given a warning signal, the silence about practices as described in the reports, and the general nature of the causes found in the analyses, it can be hypothesized that the above is true for all government organizations. Chapters 7 and 8 were meant to test this hypothesis. From the evidence and analyses presented there it can be safely concluded that the hypothesis stands.

Postscript.

Later analysis has shown that one crucial condition is missing in the above. Unless this condition is fulfilled, some of the other conditions cannot be realized properly. The missing condition has been hinted at (unawares). Section 6.7 has nevertheless been left as it was, to show the difficulty of the inquiry. At least of the inductive part. At this point in the report, identification of the missing condition is left as an exercise to the reader. Of course, the answer can be found in chapter 9.

Governed by Lies

Book 2

The financial crises of 2007-2013

Chapter 7. The financial crises of 2007-2013.

Introduction.

The title of this chapter, “The financial crises of 2007-2013”, plural, refers to the subprime or liquidity crisis of 2007-2008, and the crisis of the government debts of Greece and other EU countries beginning at the end of 2009.

The financial crises are studied because they provide information and insight which previous cases provide hardly or not, and because the new information and insight are needed to get a more complete picture and understanding of the phenomena studied in this book. In contrast to the previous cases, most information provided by the financial crises concerns the top functionaries, most of them politicians. There are more reasons:

1. The fact that the crises had enormous consequences: almost everybody in at least the western countries has experienced substantial harmful consequences from the crises;
2. The clarity about many important facts, thanks to good documentation and its availability;
3. The large amount of documentary information about the conduct of the principal actors in the (pre)history of the crises, and about the way they accounted for their conduct;
4. The clarity the information provides about the integrity and competence of the principal actors;
5. The previous cases show more than they explain. The picture they give of the functioning of the political top is implicit. Study of the financial crises gives explicit information.

Where it is to be understood that the information covers not only the years 2007 and later, but also the prehistory of the crises, here defined as the history of the years 1994-2006.¹ For the reasons given, everyone can check everything that is said in this chapter for her- or himself. This makes the financial crisis one of the most revealing and convincing cases of this book.

It turns out that the first financial crisis, the subprime crisis, provides enough information to answer all important questions which remain after the investigations reported in the preceding chapters. The second crisis, the debt crisis, is much easier to understand. At least with the help of the results of the study of the first. For these reasons only the first crisis will be studied in some detail. Of the second only the main facts will be discussed.

To get the facts ordered neatly, and to avoid interference between facts and analysis as much as possible, this chapter is split in two parts: a Chronicle with a report of the most relevant events, and an Analysis. The Chronicle was written first, but adjusted (mainly supplemented) during the analysis.

The chapter is supplemented by a rather voluminous series of appendices. The appendices were mostly written in an early stage of the study of the subprime crisis. They are part of the study of individual actors and subjects. They are mainly based on contemporary sources. That is: sources from the years 1994-2006. They were written before the corresponding parts of the chronicle and analysis. Not all of the material of the appendices fits smoothly in either chronicle or analysis. In general the most important findings are summarized in the main text. All of the appendices probably played a role in the writing of the main text, at least subconsciously. They contain much relevant information, and may be used as a guide to the dossier.

In the Chronicle it has been tried to sketch or indicate all those events and phenomena which are necessary to explain and understand the origin and course of the financial crises. It sketches events and phenomena which show the incorrectness of some of the common explanations. To enable verification or falsification, it has been tried to discover and describe all possibly relevant phenomena. Complete-

¹ This period is chosen because one of the most important reports in the context of the subprime crisis dates from 1994, and because this period turns out to be sufficient for the purposes of this work.

ness in another sense has not been pursued. As little attention as possible is given to matters which are not essential for the explanation of the crises or the refutation of incorrect explanations. Such as details of “new” financial products.²

In the first instance the purpose of the Chronicle is to get an overview of the relevant facts. In the second instance it must provide the material necessary for an analysis. For an analysis aimed at explanation and finding measures for the prevention of similar phenomena. In particular to prevent innocent people from being harmed by avoidable behavior of other people of which they never approved. To realize this ultimate goal, the history need not be told in every detail. Neither need all aspects of every financial instrument and process be understood. As regards the ultimate goal it will be sufficient to show that the measures are necessary and sufficient to prevent crises like those of 2007-2013.

Part 2 of the chapter is called Analysis. It represents an effort to understand the history and prehistory of the crises, and to find sufficient measures to prevent repetition. The Chronicle is written to be as much self-explanatory as possible. But the Chronicle would no longer be a chronicle if it were frequently interrupted by too much background information, and by analyses of the possible relations between background information and the events and phenomena described in the Chronicle. By discussing separately what can be discussed separately one avoids the risk of losing track and mixing things up. There is no need to do everything at once. Therefore the analytic part of this study of the financial crises has been kept separate from the chronicle.

As regards the content of the Analysis, it is noted that in order to understand the past and learn what can be learnt from it, it is often not sufficient to know what happened. What people do and do not is not only determined by historical events, but also by their personal characteristics, including their education and other personal circumstances and experiences. It is affected by boundary conditions like the law, the organization of society, and the state of knowledge. In so far as possible and relevant, these topics will be studied in the Analysis.³

In another sense too, it is not sufficient to know what has happened. It may be just as important to know what could and should have happened, but did not happen. More specifically: it may be just as important to know what could and should have been done, but was not done. The present work shows that understanding of what did not happen is of crucial importance to avoid crises, wars and other disasters. Both the subprime crisis and World War 2 would not have happened if there had not been enterprising actors. But the actors would not have had any chance of success if responsible authorities had not knowingly allowed the risk to grow out of control, but done their legal duty.

The hypothesis about the importance of omissions is strongly supported by the subprime and governmental debt crises. Study of what happened and did not happen in the prehistory of the crises, and of the duties of the relevant people and organizations, reveals that the crises could have been avoided if legal duties had been fulfilled appropriately. Instead, governments recklessly fostered the growth of the risks. They had, and still have, no risk management whatsoever. Like their governments, supervisors had the duty to protect the population. But they remained passive, at the same time falsely proclaiming that the financial system was safe and sound, and that they did everything possible and necessary to keep it so. Obviously, establishing and understanding the irresponsible behavior of the relevant officials is essential for finding measures to prevent repetition, and to prevent other disasters.

No reliable explanation can ignore important facts, or leave important questions unanswered. One important fact is that the government and supervisory organizations responsible for the safe and sound operation of the financial system had (and have) tens of thousands highly educated employees.

Another important fact is that well-argued crisis scenarios had been outlined by authoritative

² The “new” is written between quotation marks because the products were often called “new” in the hearings of inquiry commissions immediately following the subprime crisis, even though the products existed already around 1994. See the GAO 1994 report specified below. The products can only have been called “new” to mislead the audience by suggesting “we couldn’t know yet”, and thereby exculpate the speaker.

³ An example. When in certain respects the members of a well-defined group of people show similar behavior, the differences in personal histories of these people cannot be very significant. Therefore personal histories need not be studied. (At least not extensively).

organizations long before the subprime crisis actually took place. How can these two facts be reconciled? To answer this and similar questions the Analysis pays ample attention to the functioning of those parts of public administration which had legal duties with respect to the safety and soundness of the financial system.

Part A. Chronicle.

Table of contents of this Part A.

1. The chronicle in a nutshell.
2. Chronicle. (1938-2011, subdivided as seemed convenient).

7A.1. The chronicle in a nutshell.

Modern banking is characterized by leverage. Banks are allowed to lend an amount that is a multiple of their capital (assets). The multiple is called leverage. Uncertainty about borrowers' ability to pay what is due means that more leverage increases the risk of bankruptcy. In the period considered, the leverage ratio is often more than 10, sometimes more than 20. In 1988 the Basel Committee on Banking Supervision (BCBS), composed of representatives of central banks and supervisors, published Basel I, a set of recommendations for capital requirements for financial institutions. The recommendations were widely accepted and implemented. However, the recommendations accomplished the opposite of its supposed intentions. Instead of decreasing, leverage increased. Thereby increasing the instability of the financial system.

In a period including 1990-2008 the governments of most countries with a relatively high GDP per capita implemented deregulation.⁴ With minor exceptions, governments, supervisors and private enterprises claimed that the general welfare is served by less regulation and supervision. The financial system was said to have sufficient interest in adequate self regulation and responsible behavior to prevent harmful accidents. Governments, supervisors and private enterprises resisted everything that seemed to imply more rules or interference.

Since 1992 or earlier, law and policy in the USA were directed at increasing home ownership, especially of people with moderate and lower incomes. Reduction of mortgage requirements was one of the means to realize this goal. The US government gradually increased the pressure on the financial system to provide mortgages even for people who could not afford it. Availability of loans was promoted by allowing government sponsored (mortgage) enterprises, GSEs, to loan much against exceptional little capital, and by suggesting that the value of mortgage backed securities (MBS) sold by GSEs was guaranteed by the government of the USA.

Law and policy were successful in this sense, that home ownership of people with moderate and lower incomes increased substantially. At least until 2006. But they also substantially increased the percentage of more risky mortgages (vulnerable mortgagors).

At no time did the US government consider the risks of its policy.

Mortgages were included in various kinds of securities. The performance, and therefore market value, of these securities depended on the performance of the underlying mortgages. They were spread all over the financial system, and beyond. In the years 1992-2001, securities incorporating mortgages came to form a significant part of the assets of banks.⁵

In the USA, the interest rate on mortgages reached a maximum of 18% (per year) in 1982. From

⁴ GDP= gross domestic product. GDP is expressed in currency units such as USD, euros, etc. In a first approximation, the GDP is the sum of the incomes of persons and enterprises. For further explanation of the concept and of related concepts the reader can consult an economics textbook or try the internet.

⁵ Statistics are given in the OFHEO report on systemic risk. They are quoted below, under 2003, or search for "role of OFHEO".

then on it decreased more or less gradually to about 5% in 2010.

In 1991-2006 home prices approximately doubled.

In 2004 the BCBS made recommendations for changes in the capital requirements of Basel I. The new set of norms is called Basel II.

In the period under consideration, all main financial supervisors always gave an optimistic picture of the state of the financial system. They never gave a realistic picture of the risks. They never said that specific measures or actions were really necessary, and that doing nothing would mean disaster. If not now, then in the near future. The US Fed gave no attention at all to systemic risk.⁶ Some supervisors did see some risks, and did warn for them. But not all of these risks had anything to do with causes of a crisis. The warnings were moreover presented in such a way as to give policy makers an easy excuse for not bothering. Supervisors never communicated a sense of urgency. Consequences of risks were never explained. Often, supervisors arrogantly and complacently claimed that due to their hard working expert staff everyone's money was safe and secure.

Only in exceptional cases have government organizations detailed systemic risks, and made recommendations to reduce or eliminate them. The exceptions are the GAO reports of 1994 and 1999, and to a lesser extent the BIS CGFS report of 2003 (and similar sequels).⁷ The GAO reports explicitly sketch crash scenario's, and warn for the risks which actually precipitated the financial crisis of 2007-2008. The report of 1999 had the unambiguous title: *LTCM: Regulators Need to Focus Greater Attention on Systemic Risk*. In response, the financial supervisors and (ir)responsible government officials argued that they already did what was needed. In other words: they ignored the report and its recommendations.

It has been asserted that the ratings of the rating agencies underestimated the risks. The documentary evidence for this assertion is inconclusive. It seems certain however that the ratings have been interpreted incorrectly (stupidly), and that after the fact something impossible was asked from the rating agencies. In this connection, but also quite generally, a small risk was generally thought to mean no risk. Which is dangerous nonsense.

In April 2006 home prices in the USA reached a maximum. In other words: from then on they decreased. It is this phenomenon that determined the time schedule of the first financial crisis. As from this moment, risks begin to be realized.

In the years 2000-2003 the cumulative default rate for mortgages originated in a given year decreased slowly. In the following years, until (& including) 2007, it increased strongly. In 2007 the default rate in the first months after origination was more than 10 times the rate in 2000-2003.

In the first half of 2007, confidence in MBS and similar securities rapidly deteriorates. Markets expect related prices and indexes to decrease. Borrowing becomes more difficult.

In the first months of 2007 the ABX indices⁸ BBB en BBB⁻ for mortgage related securities fall from 100 to about 65. In July the AA index is still almost 100, while that for BBB⁻ has fallen to 55. Around the turn of the year 2007-2008 it is 20.

July 2007. Rating agency Moody's downgrades recent MBS on a wide scale. Because of problems with its MBS portfolio, the German bank IKB is taken over by KfW Bankengruppe. Downgrades also cause serious difficulties for Bear Stearns and BNP Paribas.

The financial supervisors continue to underestimate risks and potential consequences.

⁶ Fed= Federal Reserve Bank. The Fed is the US central bank and supervisor. For information see the Fed publication *Purposes and Functions* in the directory USA\Fed.

⁷ GAO= General Accounting Office (1921-2004), and Government Accountability Office (as from 2004). BIS= (International) Bank of International Settlements, and CGFS= Committee on the Global Financial System. For explanation see any BIS annual report in the directory BIS\Annual reports.

⁸ For MBS related securities. See the main text, search for "Lehman Live".

August 2007. Countrywide, the USA's largest mortgage lender at the time, is unable to extend its loans at the repo market, a vital part of its operations.⁹ It fails to find the billions of dollars it needs to remain in business. The Fed refuses help. Bank of America comes to the rescue, and in October takes over Countrywide.

In the second half of 2007 the financial world sees devaluations of more than 10% along a wide front, uncompensated by gains elsewhere. At the end of 2007 many large financial institutions have to write off substantial amounts. The Fed reacts with a relatively large decrease of the discount rate. However, this does not or hardly affect the willingness of financial institutions to provide loans (i.e. to pass on loans they got from the Fed).

March 2008. The Fed purchases B\$ 30 of Bear Stearns's assets, and helps its take over by J P Morgan Chase.¹⁰

September 2008 is the month of one big bankruptcy after another. It is the month of the crash of the financial system. Milestones are:

- 7 Fannie and Freddie are placed under conservatorship of the US government;
 - 15 Bankruptcy of Lehman Brothers;
 - 15 Bank of America takes over Merrill Lynch;
 - 16 In exchange for a share of 80%, the Fed loans AIG B\$ 85;
 - 20 Treasury secretary Paulson sends a proposal of three pages for a Troubled Asset Relief Program to Congress, with a request for a budget of 700 B\$.
 - 25 Washington Mutual is "seized" by OTS, and "placed into the receivership" of FDIC.
- (All dates are in September).

The US Fed and Treasury take far reaching measures to prevent bankruptcy of most of the remaining financial institutions and total collapse of the financial system. Borrowing from the Fed is facilitated in virtually all possible legal ways. By numerous programs, hundreds of billions of dollars are made available to prevent the system to come to a standstill.

Although the USA was the source of the problems, risk management and supervision were fatally insufficient almost everywhere. As a consequence, the financial system was like a series of dominoes. Once the USA fell, all other countries were bound to follow. Everywhere central banks reduce the discount rate, and facilitate borrowing by banks. Everywhere governments implement programs to help ailing institutions, to bail out and nationalize banks etcetera.

After September 2008, solution of specific problems is replaced by general measures and programs. Which are applicable or can be used by all financial institutions (of a given type). But this does not end the deterioration of the economic situation. Unemployment increases by several percentage points (representing many millions of people), and will not start to decrease until after 2012. Many countries enter a recession (negative economic growth) which will last for years. Although it should be noted that developments in 2010 and later are only partially caused by the subprime crisis, and for the other part by the euro debt crisis.

20/5/09. The Financial Crisis Inquiry Commission (FCIC) is created by Congress to «examine the causes of the current financial and economic crisis in the United States.»^{11, 12}

⁹ Repo= repurchase agreement. This refers to a method of lending where the borrower sells securities to the lender as collateral and agrees to repurchase them at a higher price within a short period, often within one day. From the glossary of the FCIC report, p. 543/571.

¹⁰ In this report, \$ means USD unless specified otherwise.

¹¹ FCIC report p. xi.

¹² In this book, Congress always means US Congress.

23/6/09. The Temporary Commission Inquiry Financial System (= Commission De Wit, CDW) is created by the Second Chamber of the Dutch parliament. It is asked to answer the following questions: «What are the causes of the recent turbulent developments in the financial system, and what recommendations can be made on the basis of the findings of the inquiry for a more adequate operation of the financial system?»¹³

In the last year of the Second World War, government debts had risen to about 90% of gross domestic product (GDP). After the war they decreased to about 25% in 1975. The average debt of the OECD countries subsequently rose by fits and starts to 81% in 2008. In 2009-2012 it rose further, to 108% in 2012.¹⁴

Decision making about the euro took place mainly in 1990-2001. It had an authoritarian and propagandistic character. On 1/1/01 Greece was admitted to the euro, even though it did not satisfy the (rather weak) Maastricht convergence criteria by far. Europe and the euro were musts. Benefits were measured out widely, costs and risks were said to be negligible. The benefits were no more than wishful thinking. Doubts were not refuted with arguments, but rejected out of hand, as efforts at obstruction, and anti Europe. Politicians may have perceived no other option: the EU is far too unwieldy to be able to correct mistakes.

In October 2009 Greece gets a new government. In December it announces that the Greek government debt was much larger than the previous government, with Kostas Karamanlis as prime minister, had told. For 2009 it was 130% of GDP. As a consequence, the interest on new Greek government debt rises to heights which make markets doubt whether Greece will ever be able to redeem its debts.

In April 2010 the Greek government asks EU for a loan of B€ 60. In the beginning of May the EU and IMF approve a loan to Greece of B€ 100 for 3 years.¹⁵ On the major part of the loan Greece has to pay 5% interest. The loan is conditional. Greece is required to cut its government budget drastically. The measures taken by the Greek government to comply with this condition cause widespread long term unemployment of about 25%, and other misery.

In the EU, no government created as much relative debt as Greek governments. But several other countries were not far behind, and most of them, including euro-countries, have debts far exceeding the agreed debt ceiling of 60% GDP. Some are confronted with interest rates explosions like that of Greece earlier. In 2010 and 2011, under the pretext of a supposed need to prevent serious devaluation of the euro, stronger euro countries provide large loans to Ireland and Portugal under conditions similar to those for Greece. In 2011 the European Central Bank starts buying Italian and Spanish government bonds, with the same effect.

As a consequence of these events, the period 2010-2015 is characterized by economic uncertainty and muddling through. Including uncertainty about the future of the financial system and the EU. Events suggest important differences in government conduct, “culture”, between the north and south of the EU. Obviously serious policy errors had been made regarding euro, budgets and debts. In the EU, the same people were responsible for insufficient supervision of the financial system and insufficient supervision of compliance with the agreed deficit and debt criteria.

7A.2. Chronicle.

Introduction: the GSEs 1938-1981.

Understanding the chronicle requires a minimal acquaintance with the mortgage market and the concept of GSE. This section should suffice to start with.

One of the key indicators for the state of the mortgage market is the percentage of defaulting

¹³ First report of the CDW (= CDW1) p. 29/25. The report has the title “Lost credit”.

¹⁴ OECD *Economic Outlook* 2012-1, annex table 32.

¹⁵ These loans are kept off balance: they are not counted in the calculation of government debt...

mortgages. In the USA and before 2004, this percentage had been constant for many years. Between 2004 and 2007 it increased substantially. It was this increase that started the avalanche that grew into a financial crisis. For this reason it is crucial to get an idea of the development of the US markets for mortgages and houses, and of the actors affecting that market.

The biggest and most important actors were two government-sponsored enterprises, abbreviated GSEs. Namely the Federal National Mortgage Association, mostly called Fannie Mae, and the Federal Home Loan Mortgage Corporation, mostly called Freddie Mac. They were instituted and regulated by law, and were instruments of government housing policy. The Wikipedia describes their history as follows:

«The Federal National Mortgage Association (FNMA), colloquially known as Fannie Mae, was established in 1938 by amendments to the National Housing Act after the Great Depression as part of Franklin Delano Roosevelt's New Deal. Fannie Mae was established to provide local banks with federal money to finance home mortgages in an attempt to raise levels of home ownership and the availability of affordable housing. Fannie Mae created a liquid secondary mortgage market and thereby made it possible for banks and other loan originators to issue more housing loans, primarily by buying Federal Housing Administration (FHA) insured mortgages. For the first thirty years following its inception, Fannie Mae held a monopoly over the secondary mortgage market.

It was acquired by the Housing and Home Finance Agency from the Federal Loan Agency as a constituent unit in 1950. In 1954, an amendment known as the Federal National Mortgage Association Charter Act made Fannie Mae into "mixed-ownership corporation" meaning that federal government held the preferred stock while private investors held the common stock; in 1968 it converted to a privately held corporation, to remove its activity and debt from the federal budget. In the 1968 change, arising from the Housing and Urban Development Act of 1968, Fannie Mae's predecessor (also called Fannie Mae) was split into the current Fannie Mae and the Government National Mortgage Association ("Ginnie Mae").

Ginnie Mae, which remained a government organization, supports FHA-insured mortgages as well as Veterans Administration (VA) and Farmers Home Administration (FmHA) insured mortgages. As such Ginnie Mae is the only home-loan agency explicitly backed by the full faith and credit of the United States government.

In 1970, the federal government authorized Fannie Mae to purchase private mortgages, i.e. those not insured by the FHA, VA, or FmHA, and created the Federal Home Loan Mortgage Corporation (FHLMC), colloquially known as Freddie Mac, to compete with Fannie Mae and thus facilitate a more robust and efficient secondary mortgage market.

In 1981, Fannie Mae issued its first mortgage passthrough and called it a mortgage-backed security. The Fannie Mae laws did not require the Banks to hand out subprime loans in any way.¹⁶ Ginnie Mae had guaranteed the first mortgage passthrough security of an approved lender in 1968 and in 1971 Freddie Mac issued its first mortgage passthrough, called a participation certificate, composed primarily of private mortgages.»¹⁷

In its Annual report 2006 Fannie Mae presents itself as follows:

«Overview.

Fannie Mae's activities enhance the liquidity and stability of the mortgage market and contribute to making housing in the United States more affordable and more available to low-, moderate- and middle-income Americans. These activities include providing funds to mortgage lenders through our purchases of mortgage assets, and issuing and guaranteeing mortgage-related securities that facilitate the flow of additional funds into the mortgage market. We also make other investments that increase the supply of affordable housing.

We are a government-sponsored enterprise ("GSE") chartered by the U.S. Congress under the name "Federal National Mortgage Association" and are aligned with national policies to support

¹⁶ Formally this may be true, but materially it is not. See the requirements of the GSE Act, outlined under 1992.

¹⁷ "Fannie Mae", Wikipedia, 14/5/12. Another source is the FCIC staff study *Government sponsored enterprises and the financial crisis*. It can be found in the directory FCIC.

expanded access to housing and increased opportunities for homeownership. We are subject to government oversight and regulation. Our regulators include the Office of Federal Housing Enterprise Oversight (“OFHEO”), the Department of Housing and Urban Development (“HUD”), the SEC, and the Department of the Treasury.

Although we are a corporation chartered by the U.S. Congress, the U.S. government does not guarantee, directly or indirectly, our securities or other obligations. We are a stockholder-owned corporation, and our business is self-sustaining and funded exclusively with private capital. Our common stock is listed on the New York Stock Exchange (“NYSE”), and traded under the symbol “FNM.” Our debt securities are actively traded in the over-the-counter market.¹⁸ [...]

Our customers.

Our principal customers are lenders that operate within the primary mortgage market where mortgage loans are originated and funds are loaned to borrowers. Our customers include mortgage banking companies, investment banks, savings and loan associations, savings banks, commercial banks, credit unions, community banks, and state and local housing finance agencies. Lenders originating mortgages in the primary mortgage market often sell them in the secondary mortgage market in the form of loans or in the form of mortgage related securities.

Our lender customers supply mortgage loans both for securitization into Fannie Mae MBS¹⁹ and for purchase for our mortgage portfolio. During 2006, over 1,000 lenders delivered mortgage loans to us, either for securitization or for purchase. We acquire a significant portion of our single-family mortgage loans from several large mortgage lenders. During 2006, our top five lender customers, in the aggregate, accounted for approximately 51% of our single-family business volume compared with 49% in 2005. Our top customer, Countrywide Financial Corporation (through its subsidiaries), accounted for approximately 26% of our single family business volume in 2006 compared with 25% in 2005. Due to increasing consolidation within the mortgage industry, we, as well as our competitors, seek business from a decreasing number of large mortgage lenders.»²⁰

In its Annual report 2006, Freddie Mac presents itself as follows:

«Overview.

Freddie Mac is a stockholder-owned company chartered by Congress in 1970 to stabilize the nation's residential mortgage markets and expand opportunities for homeownership and affordable rental housing. Our mission is to provide liquidity, stability and affordability to the U.S. housing market. We fulfill our mission by purchasing residential mortgages and mortgage-related securities in the secondary mortgage market. We are one of the largest purchasers of mortgage loans in the U.S. We purchase mortgages and bundle them into mortgage-related securities that can be sold to investors. We can use the proceeds to purchase additional mortgages from primary market mortgage lenders, thus providing them with a continuous flow of funds. We also purchase mortgage loans and mortgage-related securities for our investments portfolio. We finance our purchases for our investments portfolio and manage associated interest-rate and other market risks primarily by issuing a variety of debt instruments and entering into derivative contracts in the capital markets.

Though we are chartered by Congress, our business is funded completely with private capital. We are responsible for making payments on our securities. Neither the U.S. government nor any other agency or instrumentality of the U.S. government is obligated to fund our mortgage purchase or financing activities or to guarantee our securities and other obligations.

Our Charter and Mission.

The Federal Home Loan Mortgage Corporation Act, which we refer to as our charter, forms the framework for our business activities, shapes the products we bring to market and drives the services

¹⁸ Fannie Mae Annual Report 2006 p. 1/16. The notation “p. 1/16” means: p. 1 according to the paging in the document itself, and (this corresponds with) p. 16 of the pdf-file. “Annual report” may henceforth be abbreviated “AR”.

¹⁹ MBS = mortgage backed securities.

²⁰ Fannie Mae Annual Report 2006 p. 4/19.

we provide to the nation's residential housing and mortgage industries. Our charter also determines the types of mortgage loans that we are permitted to purchase [...].

Our mission is defined in our charter:

- to provide stability in the secondary market for residential mortgages;
- to respond appropriately to the private capital market;
- to provide ongoing assistance to the secondary market for residential mortgages (including activities relating to mortgages on housing for low- and moderate-income families involving a reasonable economic return that may be less than the return earned on other activities) by increasing the liquidity of mortgage investments and improving the distribution of investment capital available for residential mortgage financing; and
- to promote access to mortgage credit throughout the U.S. (including central cities, rural areas and other underserved areas) by increasing the liquidity of mortgage investments and improving the distribution of investment capital available for residential mortgage financing.

To facilitate our mission, our charter provides us with special attributes including:

- exemption from the registration and reporting requirements of the Securities Act of 1933, or the Securities Act, and the Securities Exchange Act of 1934, or the Exchange Act. We are, however, subject to the general antifraud provisions of the federal securities laws and have committed to the voluntary registration of our common stock with the Securities and Exchange Commission under the Exchange Act;
- favorable treatment of our securities under various investment laws and other regulations;²¹
- discretionary authority of the Secretary of the Treasury to purchase up to \$2.25 billion of our securities; and
- exemption from state and local taxes, except for taxes on real property that we own.

Our activities in the secondary mortgage market benefit consumers by providing lenders a steady flow of low-cost mortgage funding. This flow of funds helps moderate cyclical swings in the housing market, equalizes the flow of mortgage funds regionally throughout the U.S. and makes mortgage funds available in a variety of economic conditions. In addition, the supply of cash made available to lenders through this process reduces mortgage rates on loans within the dollar limits set in accordance with our charter. These lower rates help make home ownership affordable for more families and individuals than would be possible without our participation in the secondary mortgage market.»²²

The following shows a mechanism by which GSEs create added value:

«The GSEs did a large part of their business securitizing mortgages into MBS and guaranteeing these mortgages against default risk. These transactions were usually "swap" transactions, where the mortgages were never held on the GSEs' balance sheets. When a GSE issues and guarantees MBS, the GSE bears the credit risk (and the associated management and operations risk) but shifts the interest rate risk, and the associated returns, to investors in the MBS. An MBS represents an undivided interest in a pool of mortgage loans. A lender that held a portfolio of mortgages would obtain a GSE guarantee for the mortgages and thus convert them to MBS. The GSE guarantee assumed the credit risk of that pool of mortgages, which increased the market value of the pool. As a result of the GSE guarantee, the institution holding the MBS faced lower capital requirements. [...] For example, under Basel I total capital required for an agency MBS was 1.6%, versus 4% on whole loans.»²³

For more information about GSEs the reader is referred to the sources mentioned in the footnotes, and to the preliminary FCIC staff study *GSEs and the financial crisis*.²⁴

Now we can turn to the chronicle.

²¹ Such as Basel I. See the next quote. The favorable treatment also applies to Fannie Mae.

²² Freddie Mac, Annual Report 2006 pp. 1-2/13-4.

²³ *GSEs and the financial crisis* (FCIC Preliminary staff study) p. 11 (incl. footnote 23).

²⁴ Several preliminary staff studies are collected in the directory FCIC/Studies/Staff-studies.

1957.²⁵

The Treaty of Rome is signed by Belgium, France, West Germany, Italy, Luxemburg, Netherlands, and UK. They form the European Economic Community (EEC). Its objective was to create a "common market" to increase economic prosperity and contribute towards "an ever closer union among the peoples of Europe". The treaty makes no mention of economic and monetary union and a single currency.

Denmark, Ireland, and the United Kingdom join the EEC in 1973, Greece in 1981, and Portugal and Spain in 1986. Former East Germany is admitted as part of reunified Germany in 1990. Greenland, a dependent state of Denmark that entered the EC when under full Danish rule, withdrew in 1985.

1962.

The paper *Government Housing Policies in the Lead-up to the Financial Crisis: A Forensic Study* by Edward J. Pinto gives a chronicle of events in the field of housing policy which influenced the development of the crisis.²⁶ Pinto's chronicle starts with 1962-1991.²⁷ Pinto shows that in this period "community groups", acting as lobbyists, exerted political pressure to get mortgage conditions lightened, so that people with low and moderate incomes could obtain a mortgage ("own a home") more easily. The most important policy instruments in this period are the Federal Housing Administration (FHA), and the Community Reinvestment Act (CRA).

With respect to 1962 Pinto notes:

«Since it was established in 1934, FHA has been reliant on low down payments and long-term fixed rate mortgages. It initially insured fixed rate loans with a maximum LTV²⁸ of 80% (up from 50%-60% by non-government lenders) and a loan term of 20 years (up from a maximum of 12 years by non-government). By 1962 it would be insuring LTVs up to 95% and loan terms of 30 years.

Along with LTVs and loan terms, FHA's foreclosure²⁹ rate has also been increasing, a trend that would continue for the next 58 years. In 1956 FHA's annual foreclosure start rate was up to 0.37% per year. By 1961 FHA was experiencing a tripling of its foreclosure start rate to 1.00% per year.»

1967-1979.³⁰

1967. The EEC merged with the European Coal and Steel Community and the European Atomic Energy Community to form the European Communities, or EC (the plural was dropped from the name in the 1980s).

1969. The heads of the EC governments set up a working group under the direction of Luxembourg Prime Minister Pierre Werner to report on how a European Monetary Union (EMU) can be achieved by 1980.

1970. The Werner group submits its report in October. It set out a three-stage process to achieve an EMU within a 10-year period. The final objective would be irrevocably convertible currencies, free movement of capital, and the permanent locking of exchange rates, or a single currency. Monetary

²⁵ Encyclopedia Britannica 2002 article *European Union*, and *A brief history of the euro* on the website of the Belgian central bank (nbb.be). The brief history is part of the file *Histories of the euro* in the directory EU/Euro.

²⁶ The report can be found in the directory FCIC/Studies, under 20100814.

²⁷ Pp. 31-45.

²⁸ LTV = loan to value. That is: the ratio of the value of the loan to the value of the object purchased with the loan. For example: the ratio (value of mortgage)/(value of house), in general expressed as a percentage.

²⁹ Foreclosure= a legal proceeding that bars or extinguishes a mortgagor's right of redeeming a mortgaged estate (Merriam Webster 2002).

³⁰ *A brief history of the euro* on the website of the Belgian central bank (nbb.be) and *One currency for one Europe- the road to the euro*, EU publications office, DOI 10.2765/65860 (2014). Both can be found in the directory EU/Euro.

turbulence and the end of the Bretton Woods agreements³¹ prevent the project from being carried out.

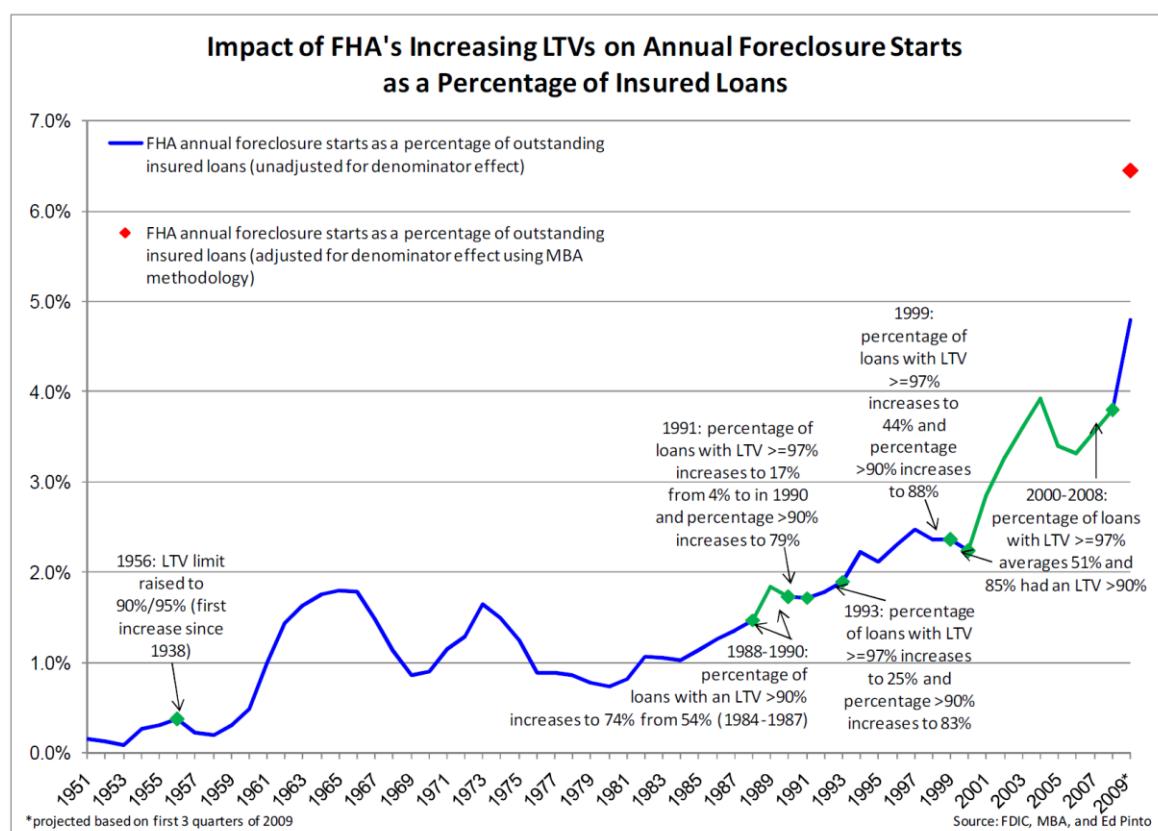

1979. In March 1979 the European Monetary System (EMS) is created, to stabilize exchange rates and counter inflation. It also created the European Monetary Cooperation Fund (EMCF).

The EMS was built on the concept of stable but adjustable exchange rates defined in relation to the ECU, the European currency unit. The ECU was a “basket” currency based on a weighted average of EMS currencies. Within the EMS, currency fluctuations were controlled through the exchange rate mechanism (ERM) and kept within $\pm 2.25\%$ of the central rates, with the exception of the Italian lira, which was allowed to fluctuate by $\pm 6\%$. While the EMS’s primary purpose was to reduce exchange-rate instability which was seen as damaging to trade, investment and economic growth, its creation was undoubtedly helped by a new consensus among EEC countries that controlling and reducing inflation had to become an economic priority.

The EMS was a radical new departure because exchange rates could only be changed by mutual agreement of participating EU countries and the Commission, an unprecedented transfer of monetary autonomy.

1980-1985.

In the years 1980-1991 the percentage FHA-mortgages with an LTV > 95% increased from less than 20% to 45%.³² For some details see the following graph. The graph shows that in the same period the foreclosure start rate approximately doubled.

With respect to the effect of the Community Reinvestment Act (CRA) on lending and lobby groups

³¹ The Bretton Woods agreements provided an international framework for currency stability with gold and the US dollar as the predominant monetary standards. For details see for example an encyclopaedia or the Wikipedia.

³² Pinto, chart 19 on p. 35.

Pinto notes and quotes the following:

«Most [people] agree that CRA had very little impact in its early years. Announced CRA commitments over CRA's first 15 years from 1977 to 1991 totaled less than \$9 billion, with almost half of this total announced in 1990 and 1991. This was likely due to the fact that many industry participants were reluctant to weaken underwriting standards. Also until 1995 CRA was based on the effort put forth by a bank, not [on] results as measured by actual loan volume. Finally, regulators had minimal ability to penalize a bank for any perceived CRA shortcomings. While announced CRA commitments did not represent all CRA activity and CRA activity did not represent all low- and moderate-income lending, community groups viewed these CRA volume levels as small compared to overall origination volume (total originations were running about \$500 billion/year in 1990 and 1991).»

By the mid-1980s, these groups concluded that Fannie and Freddie's underwriting requirements were to blame for the perceived low level of CRA volume. In about 1986, National People's Action (NPA), a consumer advocacy group, began to meet separately with Fannie and Freddie in an effort to get them to adopt more flexible underwriting standards in an effort to expand CRA lending. While agreeing to a number of pilot programs, Fannie and Freddie were dubious about many of the requested flexibilities. NPA, ACORN and other groups were dissatisfied with the perceived pace of change and were concerned that Fannie, Freddie, and lenders "still viewed them as 'special programs' and have not incorporated them into standard underwriting practices."»³³

«"During the 1980 to 1985 period we witnessed the emergence of Fannie Mae and Freddie Mac as significant players in the secondary mortgage market. There was a substantial increase in the average loan size because of inflation and greater willingness to lend larger amounts secured by liens on real estate. Mortgage pricing became more closely tied to national rates. The market shifted from thrifths originating loans and holding them in portfolio funded by saving accounts to tradable securities held by banks, insurance companies, mutual funds and others. We also saw the debut of wholesale mortgage companies that bought mortgages from smaller firms and turned them into securities."»³⁴

Under 1985 Pinto notes:

«While Fannie and Freddie both have conservative underwriting guidelines, FHA has loosened its guidelines»

In this year, 40% of the loans insured by FHA have an LTV > 96%.³⁵

In 1982 the mortgage (interest) rate in the US reached a maximum of 18%. As from that year until 2010 it decreased more or less gradually to 5%.³⁶

In 1985 one of the GSEs, the Farm Credit System, gets liquidity problems and help from the US government:

«While GSEs lacked a full-faith-and-credit government guarantee, their obligations generally traded at narrow spreads above Treasuries and below the level of AAA-rated securities. The government had reinforced a perception of an implicit federal guarantee when it acted to support another GSE, the Farm Credit System, when this GSE declared in 1985 that it could not meet its obligations. The federal government stepped in and provided funding through an organization called the Farm Credit System Financial Assistance Corporation. Similarly, the government arranged for support of the Financing Corporation, an organization that issued obligations with the attributes of GSE obligations, when its viability was in doubt in 1996.»³⁷

³³ Pinto pp. 34-5.

³⁴ Pinto p. 79. Pinto quotes from Thomas LaMalfa and David Olson, "Market efficiencies and nonconforming lending", Mortgage Banking, April 1, 1996. Note that the quote is from 1996.

³⁵ Pinto p. 37.

³⁶ See Figure 6.1 on p. 86/114 of the FCIC-report. The figure shows graphs for the 30-year conventional mortgage rate and for the effective federal funds rate. The figure also shows that the mortgage rate changed much more smoothly than the effective federal funds rate.

³⁷ GSEs and the financial crisis (FCIC Preliminary staff study) p. 9.

1986.

In February 1986 the Single European Act formalized political co-operation within the EC including competency in monetary policy.³⁸

1988.

In Basel, Switzerland, the national supervisors of the financial system approved an agreement about capital requirements for banks:

«[...] the Basel Committee [on Banking Supervision] (BCBS) in Basel, Switzerland, published a set of minimum capital requirements for banks. [...] Assets of banks were [...] grouped in five categories according to credit risk, carrying risk weights of zero (for example home country sovereign debt), ten, twenty, fifty, and up to one hundred percent (this category has, as an example, most corporate debt). Banks with international presence are required to hold capital equal to 8% of the risk-weighted assets.»³⁹

This agreement would later be referred to as Basel I.

The BCBS does not have the authority to prescribe rules or norms. It can only advise and recommend. Its recommendations can be adopted by national or (for example) EC supervisors.⁴⁰ Governments can translate them into laws or other binding rules, changed or unchanged as they deem fit. In the G-10, Basel I was given force of law in 1992.^{41, 42}

The effect of Basel I was the opposite of what it is supposed to have intended. Financial institutions held less instead of more capital (relatively). Their leverage increased.⁴³

The norms of Basel I didn't provide, let alone guarantee, safety. It wasn't a safety net.⁴⁴ Translated for a home owner it means that he may borrow up to at least 12 times the value of his house. The rule is similar to, or rather: supplements, limitation of liability of enterprises. Both rules mean that the larger risks are borne by society as a whole. While citizens remain fully liable.

The following quote shows what Basel I meant for MBS:

«A risk based capital weight of 20% was set for bank holders of Fannie and Freddie MBS. Private “AAA” and “AA” MBS were set at 100% and remained at this level until changed to 20% in 2001. Residential mortgages were set at a 50% level. These percentages were then applied to the base capital level of 8%. This yields the following risk based capital levels:

- Fannie and Freddie MBS: 1.6% capital (8% base capital requirement x 20% risk weight)
- Residential mortgages: 4% capital (8% base capital requirement x 50% risk weight)
- Private “AAA” and “AA” MBS: 8% capital [8% base capital requirement x 100% risk weight].»^{45, 46}

³⁸ See the file History of the euro_Wiki_20140622.

³⁹ Wikipedia 26/3/12. For more information see the appendix *The Basel agreements* or the file about the Basel Accords dated 20120326.

⁴⁰ EC= European Commission. This is more or less the board of directors of the European Union (EU).

⁴¹ See the file about the Basel Accords dated 20120326.

⁴² The G-10 is made up of eleven industrialized countries: Belgium, Canada, France, Germany, Italy, Japan, the Netherlands, Sweden, Switzerland, the United Kingdom and the United States, which consult and cooperate on economic, monetary and financial matters. The G-10 central banks also include the European Central Bank. Source of this information: the Financial Stability Report 2006 of the Swiss National (= central) Bank. (Most publications which use the concept G-10 do not specify it. Not even when statistical information is presented).

⁴³ According to Van Wijnbergen in his discussion with the Inquiry Commission De Wit: «Consequences were for example much lower capital requirements for positions which banks took when trading at their own risk. Through this gap bankers drove with a truck.» p. 25, Gespreksverslagen Commissie De Wit. Apart from this it is plausible that Basel I required less capital from US banks than hitherto applicable US regulation: 5,5% of total assets. Plausible also for political reasons (including abuse of power). See the book of Balthazar, quoted in the appendix on the Basel agreements.

⁴⁴ There was, and is, no safety net.

⁴⁵ P. 40 of Pinto. Slightly edited for the purpose of clarity.

The year 1988 provides a telltale example of the functioning of the CRA:

«In 1988 the holding company for Union National Bank, a large bank headquartered in Pittsburgh, requested approval from the Federal Reserve for its merger with Pennbancorp.... Through flexible loan underwriting, [Union National's CRA lending] agreement created an affordable conventional home-purchase product for homeownership in [Pittsburgh Community Reinvestment Group] neighborhoods. Union National Bank reduced the interest rate on these loans by at least one half of one percent below their rates, waived points, mortgage insurance, and minimum loan amounts, and increased the loan-to-value and qualifying debt-to-income ratios. To avoid the conservative underwriting preferred by secondary market investors, Union National agreed to keep these mortgages in portfolio.”⁴⁷

The last sentence means that for example the GSEs didn't want to insure or buy these mortgages. According to Pinto the example shows that “community groups were not really looking for equal treatment by banks; they wanted the private sector to provide subsidized loans”.⁴⁸

In October 1988 US presidential candidate Dukakis presented a plan to facilitate home ownership of people with low and moderate incomes by, among other things, “relaxed criteria for mortgages insured by the Federal Housing Administration”.⁴⁹

Wallison, member of the Financial Crisis Inquiry Commission, and author of one of its two minority reports, gives the following characterization of the mortgage market of the eighties as compared with its later development:

«Until the 1990s, these NTMs [= non-traditional mortgages] were never more than a fraction of the total number of mortgages outstanding. The reason that low underwriting standards were not generally used is simple. Low standards would result in large losses when these mortgages defaulted, and very few lenders wanted to hold such mortgages. In addition, Fannie and Freddie were the buyers for most middle class mortgages in the United States, and they were conservative in their approach. Unless an originator made a traditional mortgage it was unlikely that Fannie or Freddie or another secondary market buyer could be found for it.»⁵⁰

1989.

A European Council summit in Hannover on 14 June 1988 began to outline monetary co-operation. It set up the Committee for the Study of Economic and Monetary Union. The Committee was chaired by the then President of the Commission, Jacques Delors, and included all EC central bank governors. Their unanimous report, submitted in April 1989, defined the monetary union objective as a complete liberalization of capital movements, full integration of financial markets, irreversible convertibility of currencies, irrevocable fixing of exchange rates and the possible replacement of national currencies with a single currency.

The report indicated that this could be achieved in three stages, moving from closer economic and monetary coordination to a single currency with an independent European Central Bank and rules to govern the size and financing of national budget deficits.

⁴⁶ This is what the FCIC says about this: «Fatefully, the Basel rules made capital requirements for mortgages and mortgage-backed securities looser than for all other assets related to corporate and consumer loans. Indeed, capital requirements for banks' holdings of Fannie's and Freddie's securities were less than for all other assets except those explicitly backed by the U.S. government. These international capital standards accommodated the shift to increased leverage.» FCIC-report p. 49/77.

⁴⁷ Stanley A. Lowe and John T. Metzger, “A Citywide Strategy: The Pittsburgh Community Reinvestment Group”, Chapter 6, page 89 of *Organizing Access to Capital: Advocacy and the Democratization of Financial Institutions*, 2003, Gregory Squires, editor. Quoted by Pinto on p. 38. The quote is unchanged (as always, unless mentioned otherwise): the rectangular brackets are in the original. For more explanation see the FCIC minority report of Wallison, in particular section III. 6 on p. 524/552.

⁴⁸ Still from p. 38 of Pinto.

⁴⁹ Pinto p. 40.

⁵⁰ FCIC report, minority report of Wallison (shortly : FCIC Wallison report), p. 486/514.

The proposed stages were:

1. Complete the internal market and remove restrictions on further financial integration (1990-94);
2. Establish the European Monetary Institute to strengthen central bank cooperation and prepare for the European System of Central Banks (ESCB). Plan the transition to the euro. Define the future governance of the euro area. Achieve economic convergence between the EC countries (1994-1999);
3. Fix final exchange rates and transition to the euro. The ECB and ESCB are responsible for independent monetary policy-making. Implement binding budgetary rules in the EC countries (1999-).

On the basis of the Delors Report, the Madrid European Council of June 1989 decided to proceed to the first stage of EMU in July 1990, and the 1989 Strasbourg European Council called for an intergovernmental conference to determine the Treaty revisions that would be needed to move to the second and third stages and implement EMU.⁵¹

1990.

On 31/5/90 secretary Jack Kemp of the US ministry of Housing and Urban Development (HUD) set up an Advisory Commission on Regulatory Barriers to Affordable Housing. The following is the unabridged "Mandate to the Commission":

«When she visited the United States, the Russian human rights "activist" Yelena Bonner said to the American people: The people of the world do not want war, they want to own a house. They want to own a home. They want the decency and dignity that goes along with their own home.

The American dream is a universal dream. But all too often this dream of ownership, of decent and affordable housing, is being denied to first-time homebuyers and low-and moderate-income families. Government rules and red tape are regulating the dream out of existence. The challenge to this Commission is to discover and to tell us how to remove those regulatory barriers.»⁵²

1991.

On 8/7/91 the Advisory Commission on Regulatory Barriers to Affordable Housing submitted its report *Not in my backyard- Removing barriers to affordable housing* to president Bush and secretary Kemp of HUD. The report asserted for example:

«Fannie Mae's and Freddie Mac's underwriting standards are oriented towards "plain vanilla" mortgages. The standards encourage lending in suburban, growing, homogenous, and higher income areas, where housing and zoning requirements result in the production of "cookie cutter" new homes in uniformly single-family neighborhoods. These standards work against more diverse building types and mixed-use neighborhoods, which are more difficult to assess and to underwrite.»⁵³

The report does not mention or discuss mortgage conditions, at least not explicitly. The reader has to make do with the vanilla metaphor and the conclusion of the commission.

Regarding the influence of the GSEs, the commission notes that:

«The market influence of Fannie Mae and Freddie Mac extends well beyond the number of loans they buy or securitize; their underwriting standards for primary loans are widely adopted and amount to national underwriting standards for a substantial fraction of all mortgage loans.»⁵⁴

The report pays no attention to the question how many people could in principle afford to buy and maintain their own home, and why. It does not propose to try and answer this question. The most relevant remark it makes about this question is the following:

«Regulatory barriers are not the only factors affecting housing affordability, and removing regulatory barriers will not resolve all the housing affordability problems in the United States.

⁵¹ *The road to the euro*, pp. 5-6.

⁵² P. 5 of the pdf-file of *Not in my backyard- Removing barriers to affordable housing*, in the directory USA, under 19910708. Henceforth the report will be called NIMBY.

⁵³ NIMBY p. 3-13/65.

⁵⁴ NIMBY p. 5-3/81.

Significant and substantial problems would remain for the poorest families in society. At the same time, however, the regulatory barriers that now exist are exacerbating the problems of the poor. The Commission believes that a serious effort to reduce regulatory barriers is an essential component of an overall strategy to promote housing affordability.»⁵⁵

According to Pinto, around this time:

«Congress was becoming interested in addressing what it perceived as overly conservative underwriting standards.

“Lenders will respond to the most conservative standards unless [Fannie Mae and Freddie Mac] are aggressive and convincing in their efforts to expand historically narrow underwriting.” This point was reinforced over and over again by other [community advocacy] witnesses.” (U.S. Senate Committee on Banking, Housing, and Urban Affairs 1991)

This statement provides a clear indication as to Congress’ intent when it passed the GSE Act of 1992 the following year. Rather than being viewed as prudent, the GSEs’ standards were attacked for being inflexible and too conservative. Ignored was the fact that these standards were designed to originate sustainable loans in a safe and sound manner. They were based on the “Three Cs of Mortgage Credit”.⁵⁶ As noted previously, Fannie’s underwriting standards had undergone a thorough risk based review in 1985 to address the substantial losses it had incurred on high LTV and highly leveraged loans in the early 1980s.»⁵⁷

Before the arrival of the new GSE law in 1992, three non-overlapping mortgage markets could be distinguished:

- «The prime market generally served borrowers with low to medium LTVs (however first time home buyers have a substantially higher usage of high LTV financing), excellent credit, and moderate debt ratios.
- The FHA market served borrowers (particularly home purchase and first time homebuyers) with high LTVs, approximately half with impaired credit (a FICO⁵⁸ below 660), and high debt ratios (similar to subprime).
- The subprime market primarily served borrowers getting cash out refinances with medium to low LTVs, most with impaired credit, and with high debt ratios.

Not only were these markets quite separate and distinct, prime originators did not originate subprime loans and vice versa and a loan qualifying for FHA rarely met prime loan standards. All of this would change in 1992 with the passage of the GSE Act. Post 1992 the GSEs would be required to substantially increase their acquisitions of low- and moderate-income borrowers—the same customer bases relied on by FHA and subprime. To accomplish this they would need to depart from the investment quality credit standards that distinguished “A” lending from FHA and subprime.»⁵⁹

In December 1991 the Treaty on European Union was approved by the Heads of State or Government at the European Council at Maastricht. It was decided that Europe should have a strong and stable single currency by the end of the century. The EU Treaty, also called the Maastricht Treaty, replaced the Treaty of Rome.

For the economic and monetary union to provide a framework for more jobs and growth, and to avoid disruption, it was necessary for the member state economies to achieve a high degree of convergence before introducing the single currency. Therefore, the Treaty on European Union set the ‘Maastricht convergence criteria’ that EU countries have to meet in order to adopt the euro. They are shown in the following table. In addition, EU countries would have to achieve convergence of the national laws and rules governing their national central banks and monetary issues.⁶⁰

⁵⁵ NIMBY p. 5-10/88.

⁵⁶ According to footnote 39 on p. 22 of Pinto, the three C’s are: collateral, character, and capacity.

⁵⁷ Pinto p. 46-7.

⁵⁹ Pinto pp. 44-5, with rectangular brackets from the original, but list format (the dots) added by JFCvV.

⁶⁰ Text and table: *The road to the euro* p. 6. For the table also: nbb.be, 22/6/14.

What is measured	How it is measured	Convergence criteria
Price stability	Harmonised consumer price inflation rate	In the year before admission to euro not more than 1.5 percentage points above the rate of the three best performing EU countries
Sound public finances	Government deficit as % of GDP	Reference value: not more than 3 %, unless approaching this value at satisfactory pace
Sustainable public finances	Government debt as % of GDP	Reference value: not more than 60 %, unless approaching this value at satisfactory pace
Durability of convergence	Long-term interest rate	In the year before admission to euro not more than 2 percentage points above the rate of the three best performing EU countries in terms of price stability
Exchange rate stability	Deviation from a central rate	Participation in ERM ⁶¹ for 2 years without severe tensions

1992.

«The Federal Reserve Bank of Boston released a statistical analysis of the 1990 and 1991 HMDA [= Home Mortgage Disclosure Act] data that attempted to control for all objective indicators of applicant risk. The conclusion was that minorities were 56% more likely to be rejected than whites, down from the Federal Reserve's 1991 report of a rejection rate that was roughly double for minorities»⁶²

According to William Neilson, speaker at the Symposium on the Mortgage Discrimination Controversy in 1998, the analysis had a great impact on media and policy makers.⁶³ It is said to have been used “to support a wholesale abandonment of traditional underwriting standards”.⁶⁴ However, in 1993 it was found that there were fatal errors in the analysis of the Boston Fed.⁶⁵ Other research showed that the “default rates for black borrowers are higher than those for white borrowers”.⁶⁶ Invalidating the hypothesis that the selection was (only) based on discrimination instead of objective judgment of financial capacity.

«In 1992, Congress enacted Title XIII of the Housing and Community Development Act of 1992 (the GSE Act), legislation intended to give low and moderate income borrowers better access to mortgage credit through Fannie Mae and Freddie Mac.»⁶⁷

«Among the requirements imposed by the GSEs' charters were requirements to serve the market for low- and moderate-income people and underserved markets. When Fannie Mae became a GSE in 1968 its charter authorized HUD to set affordable housing requirements as a portion of the company's mortgage purchases, “but with reasonable economic return to the corporation.” The 1992 Federal Housing Enterprises Financial Safety and Soundness Act authorized the HUD Secretary to set affordable housing goals for Fannie Mae and Freddie Mac “involving a reasonable economic return that may be less than the return earned on other activities.” Both Freddie Mac and especially Fannie Mae publicly promoted policies to increase the homeownership rate in the United States.

The 1992 Act established three housing goals [affordable housing goals, abbreviated AH-goals],

⁶¹ ERM= exchange rate mechanism.

⁶⁵ The Boston Fed is the Federal Reserve Bank at Boston. It is part of the US Federal Reserve System.

⁶⁶ “all other characteristics being equal”. Pinto p. 64, 1993-D.

⁶⁷ FCIC Wallison report pp. 453-4/81-2. This is confirmed by the following quote and the annual reports of the GSEs.

1. The Low- and Moderate-Income Housing Goal: loans to borrowers with incomes at or below the median income for the market area in which they live;
2. The Special Affordable Goal: loans to very low-income borrowers (those with incomes at or below 60 percent of the area median income), or to low-income borrowers living in low-income areas (borrowers with incomes at or below 80 percent of the area median income, living in census tracts in which the median income of households is at or below 80 percent of the area median income);
3. The Underserved Areas Goal: loans to borrowers living in low-income census tracts (tracts in which the median income of residents is at or below 90 percent of the area median income) or high-minority tracts (tracts in which minorities comprise at least 30 percent of residents, and the median income of residents in the tract does not exceed 120 percent of the area median income).»⁶⁸

The law empowered HUD to specify quantitative goals for the GSE's. The following quotes and graph show the use HUD made of its authority.

«Over the next 15 years, HUD consistently enhanced and enlarged the AH goals. In the GSE Act, Congress had initially specified that 30 percent of the GSEs' mortgage purchases meet the AH goals. This was increased to 42 percent in 1995, and 50 percent in 2000. By 2008, the main LMI [low and moderate income] goal was 56 percent, and a special affordable subgoal had been added requiring that 27 percent of the loans acquired by the GSEs be made to borrowers who were at or below 80 percent of area median income (AMI).

Table 10, page 510[538⁶⁹], shows that [the GSEs] Fannie and Freddie met the goals in almost every year between 1996 and 2008.»⁷⁰

«Congress also made clear in the act that its intention was to call into question the high quality underwriting guidelines of the time. It did so by directing Fannie and Freddie to “examine—

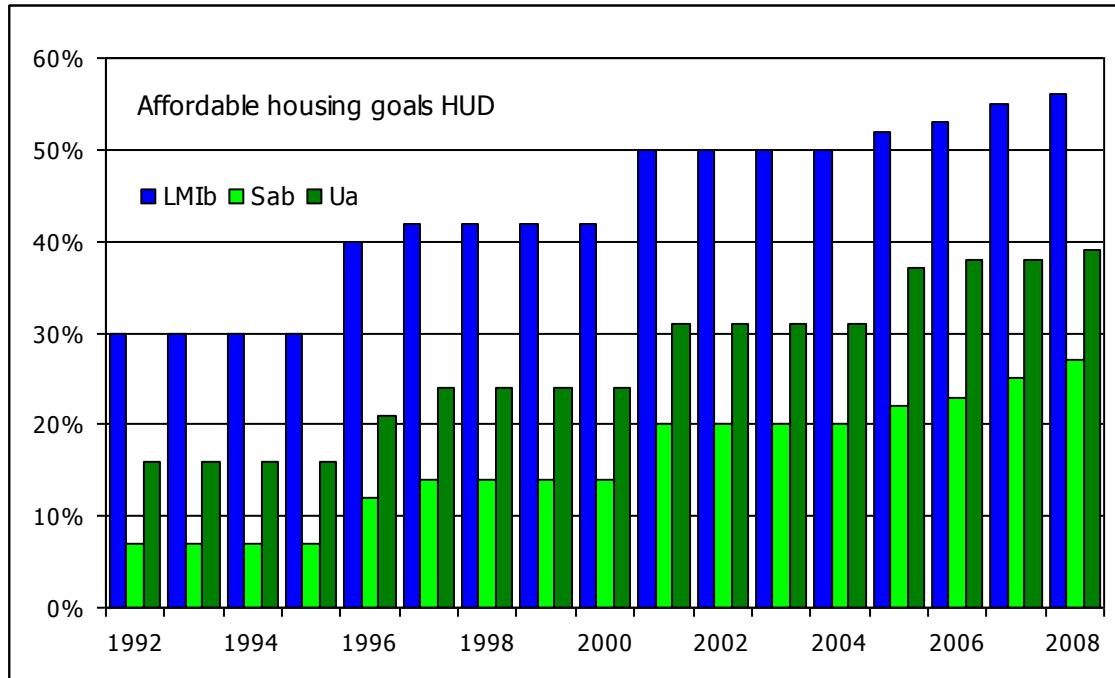

- 1) The extent to which the underwriting guidelines prevent or inhibit the purchase or securitization of mortgages for houses in mixed-use, urban center, and predominantly minority neighborhoods and for housing for low-and moderate income families;
- 2) The standards employed by private mortgage insurers and the extent to which such standards inhibit the purchase and securitization by the enterprises of mortgages described in paragraph (1); and
- 3) The implications of implementing underwriting standards that-
 - (A) establish a downpayment requirement for mortgagors of 5 percent or less;
 - (B) allow the use of cash on hand as a source of downpayments; and
 - (C) approve borrowers who have a credit history of delinquencies if the borrower can demonstrate a satisfactory credit history for at least the 12-month period ending on the date of the application for the mortgage.”».⁷¹

⁶⁸ *GSEs and the financial crisis* (FCIC Preliminary staff study) p. 6.

⁶⁹ This table corresponds with Figure 4 on p. 8 of *GSEs and the financial crisis*. Figure 4 is a graph of the GSE low and moderate income goal performance 1996-2009.

⁷⁰ FCIC Wallison report pp. 454/82.

⁷¹ FCIC Wallison report pp. 490-1/518-9.

Pinto gives the following explanation for the above stipulations in the new GSE law:

«In 1992 the interests of Fannie, community groups, and Congress converged resulting in passage of the “The Federal Housing Enterprises Financial Safety and Soundness Act of 1992” (GSE Act). Fannie got its wish as the GSE Act formalized its strategy of using affordable housing to protect its key charter privileges— protection that would last until 2008, two months before it and Freddie would be forced into conservatorship. The community groups got their wish now that Fannie and Freddie were now required to loosen underwriting standards in support of CRA. Congress got its wish by moving the affordable housing mission largely off-budget and at the same time, placing itself in a position to take credit for the affordable housing activities of Fannie and Freddie.»⁷²

The FHA was “on-budget”: it was on the budget of the federal government, and cost taxpayers’ money. This limited the possibilities to increase home ownership by means of FHA. The GSEs could (further) tap the private market.

In the sources no indication could be found for a study of the possibilities and risks of imposing affordable housing (AH) goals as mentioned, as part of the preparation of the GSE law. Estimates of side effects are not mentioned either. Neither before nor after the introduction of the law. (Periodic) evaluations of the operation and effects of the law were not prescribed or made.

In 1992 George H.W. Bush was president of the USA. The AH policy was continued by his successor, Bill Clinton, president in 1993-2001:

«In 1995, President Bill Clinton announced an initiative to boost homeownership from 65.1% to 67.5[%] of families by 2000, and one component raised the affordable housing goals at the GSEs. Between 1993 and 1995, almost 2.8 million households entered the ranks of homeowners, nearly twice as many as in the previous two years. “But we have to do a lot better,” Clinton said. “This is the new way home for the American middle class. We have got to raise incomes in this country. We have got to increase security for people who are doing the right thing, and we have got to make people believe that they can have some permanence and stability in their lives even as they deal with all the changing forces that are out there in this global economy.”»⁷³

Clinton’s successor George W. Bush followed in the footsteps of his predecessors. In the speech in

⁷² Pinto p. 51.

⁷³ FCIC p. 41/69. A memorable text!

which he accepted the nomination of the Republican party for the presidency of the USA- his second term- he said the following:

«Another priority for a new term is to build an ownership society, because ownership brings security, and dignity, and independence.

Thanks to our policies, homeownership in America is at an all-time high. Tonight we set a new goal: seven million more affordable homes in the next 10 years so more American families will be able to open the door and say welcome to my home.»⁷⁴

The quotes show that it was the policy of successive US governments to increase home (and mortgage) ownership of Americans with lower incomes. It was the policy of both republican and democratic governments. The quotes show that it was the policy of the president, and that this fact was broadcast as widely as possible.

As noted under 1980-1985, from 1982-2010 the interest rate steadily decreased. Lower interest rates make mortgages cheaper, and even apart from this the new GSE Act made it easier for larger groups of people to get a mortgage. However, mortgage buyers and/or mortgage sellers did not always think realistically about the possibility or difficulty of meeting accepted mortgage obligations in the long run. For example in the case that the interest rate increases, or house prices go down.

The decreasing interest rate caused an increase in the demand for houses and in house prices.

«From 2000 to the peak of originations in 2003, mortgage activity increased rapidly, and it continued at an elevated pace through 2006 and into 2007. By 2008, originations had fallen back to historical levels.»⁷⁵

In the peak period, the number of mortgages sold was 2 to 3 times the average historical level of 1990-2000. The levels of 1990-1995 probably were the result of the earlier mortgage conditions.⁷⁶

«FHA's annual foreclosure start rate hits 1.79%; almost double the 1% level in 1961. Notwithstanding this troubling foreclosure trend, government housing policies were being put in place that mandated loosened underwriting standards, as part of a well-publicized effort to increase the homeownership rate, ultimately to 70% by the end of 2006.»⁷⁷

Regrettably the reports are silent about the communication HUD-GSEs.⁷⁸ However, the following quote from Form 10-K of Fannie Mae about 2003 suggests that Fannie experienced pressure:

«HUD has informed Fannie Mae that the 2003 goals will remain in force during 2004, and that during the year HUD will issue new goals for 2005 and beyond. During 2001 through 2003, HUD provided incentive points for serving small multifamily and owner-occupied rental housing. These incentive points are no longer available in 2004, making the same goal levels more difficult to achieve. A unit may be counted in more than one category of goals. If HUD determines that Fannie Mae has failed to meet its housing goals and that achievement of the goals was feasible, taking into account market and economic conditions and Fannie Mae's financial condition, Fannie Mae must submit a housing plan to HUD describing the actions it will take to meet the goal in the next calendar year. If HUD determines that Fannie Mae has failed to submit a housing plan or failed to make a good faith effort to comply with the plan, HUD may take certain administrative actions.»⁷⁹

In the years $\leq 1991 - \geq 2007$ there was a political climate of deregulation and "self regulation" by for

⁷⁴ Acceptance speech given by George W. Bush to the Republican National Convention in Madison Square Garden in New York City, from 10 pm on September 2, 2004. ⁷⁹ Form 10-K of Fannie Mae for 2003, p. 15/18. The document can be found in the directory Fannie, under 20040315.

example the financial institutions.⁸⁰ The following gives an impression of the substantiation:

«More and more, regulators looked to financial institutions to police themselves—“deregulation” was the label. Former Fed chairman Alan Greenspan put it this way: “The market-stabilizing private regulatory forces should gradually displace many cumbersome, increasingly ineffective government structures.”»⁸¹

«Fed Chairman Greenspan and many other regulators and legislators supported and encouraged this shift toward deregulated financial markets. They argued that financial institutions had strong incentives to protect their shareholders and would therefore regulate themselves through improved risk management.»⁸²

The policy was implemented in regulation which gave companies more freedom:

«In 1991, the Treasury Department issued an extensive study calling for the elimination of the old regulatory framework for banks, including removal of all geographic restrictions on banking and repeal of the Glass-Steagall Act. [...] The report contended that its proposals would let banks embrace innovation and produce a “stronger, more diversified financial system that will provide important benefits to the consumer and important protections to the taxpayer.”»^{83, 84}

Consequences were: more growth, more concentration, and more leverage.

1993.

Pressure was kept on mortgage originators to ease conditions:

«Banks were in a quandary. Unless they could prove that their standard credit guidelines relating to downpayment, credit, and income did not have a disparate impact on minorities, they had to replace them with “innovative or flexible” guidelines.»⁸⁵

1994.

«CEO Jim Johnson [of Fannie Mae] announces Fannie’s Trillion Dollar Commitment to low- and moderate income housing. Just 3 years before Johnson had announced a \$10 billion commitment, but the passage of the GSE Act of 1992 necessitated a much larger commitment—100 times as large. While the sum of a trillion dollars has become commonplace today (largely thanks to the financial crisis brought on by the mortgage meltdown), this is the first time such a massive sum came into common parlance to describe a government related housing finance initiative. The total capital that would support this commitment was less than \$15 billion. Ultimately, Fannie and Freddie would announce a total of \$5 trillion in such commitments—most being highly leveraged and benefiting from loosened lending and all representing the off-budget “free lunch” so desired by Congress and HUD. These acquisitions were leveraged by the GSEs at about 60:1.»⁸⁶

Fannie also introduced a 97% LTV mortgage. In pursuance of these actions, Pinto presents empirical evidence showing the relationship between default rates and LTV. Fannie itself had done an experiment, with disastrous results.⁸⁷ Pinto concludes:

⁸⁰ “≤1991 - ≥2007” means: the years between 1991 or earlier, and 2007 or a later year. It could mean for example the period 1985-2010.

⁸¹ FCIC report p. 28/56. According to p. 558/86 the source of the quote is: Alan Greenspan, “The Evolution of Banking in a Market Economy,” remarks at the Annual Conference of the Association of Private Enterprise Education, Arlington, Virginia, April 12, 1997.

⁸² FCIC report p. 35/62.

⁸³ FCIC report p. 36/64.

⁸⁴ The following is quoted from the glossary on p. 541/69 of the FCIC report: «Glass-Steagall Act: Banking Act of 1933 creating the FDIC to insure bank deposits; prohibited commercial banks from underwriting or dealing in most types of securities, barred banks from affiliating with securities firms, and introduced other banking reforms. In 1999, the Gramm-Leach-Bliley Act repealed the provisions of the Glass-Steagall Act that prohibited affiliations between banks and securities firms.»

⁸⁵ Pinto p. 66, 1993-F.

⁸⁶ Pinto p. 66, 1994 A.

⁸⁷ Pinto p. 67, 1994 B.

«Two lessons should have been learned. First, high LTV lending suffers disproportionately high default rates when home prices come under stress. Second, FHA lending with its broader use of loosened lending standards, experiences an even higher default rate.»⁸⁸

Pinto shows that Fannie walks in the vanguard of easing mortgage requirements.

Events showed the inadequacy of self regulation. In pursuance of big losses and litigation caused by misleading information,⁸⁹ the US Government Accounting Office (GAO) published a report *Financial derivatives- Actions Needed to Protect the Financial System*.⁹⁰ GAO warns of the risks of financial derivatives. It draws attention to the difficulty (impossibility) of summing (aggregating) risks of a collection of activities and securities:

«Because of the numerous combinations of products and types of risks, no single measure exists that reflects the actual amount at risk from derivatives activities.»⁹¹

The following quotes from the GAO report show that the events of 2007-2008 cannot have come as a surprise to someone who had done his homework, or had done what he had to do because of his role in the financial system. The quotes show that the assertion that nobody could have foreseen or predict these events is both incorrect theoretically and as a matter of fact.

The GAO demonstrates the existence of a real systemic risk:

«Derivatives activities are rapidly expanding and increasingly affected by the globalization of commerce and financial markets. Much OTC derivatives activity in the United States is concentrated among 15 major U.S. dealers that are extensively linked to one another, end-users, and the exchange-traded markets. This combination of global involvement, concentration, and linkages means that the sudden failure or abrupt withdrawal from trading of any of these large dealers could cause liquidity problems in the markets and could also pose risks to the others, including federally insured banks and the financial system as a whole. Although the federal government would not necessarily intervene just to keep a major OTC derivatives dealer from failing, the federal government would be likely to intervene to keep the financial system functioning in cases of severe financial stress. While federal regulators have often been able to keep financial disruptions from becoming crises, in some cases intervention has and could result in industry loans or a financial bailout paid for by taxpayers.»^{92, 93}

The GAO has evaluated applicable regulation, and found it to be insufficient:

«GAO believes that innovation and creativity are strengths of the U.S. financial services industry and that these strengths should not be eroded by excessive regulation. However, GAO also believes the regulatory gaps and weaknesses that presently exist must be addressed, especially considering the rapid growth in derivatives activity. The issue is one of striking a proper balance between

- (1) allowing the U.S. financial services industry to grow and innovate and
- (2) protecting the safety and soundness of the nation's financial system.

⁸⁸ Pinto p. 67, 1994-B.

⁸⁹ See p. 4/6 of the GAO report *Financial derivatives- Actions needed to protect the financial system*, and pp. 46-7/74-5 of the FCIC report. This GAO report will henceforth be referred to as GAO 1994.

⁹⁰ It can be found in the directory USA/GAO, under 19940531. Study of this report is recommended strongly. According to the title page of the report, it is a report to "Congressional Requesters".

⁹¹ GAO 1994, p. 4/6

⁹² OTC= over the counter. On p. 46/74 of its report, the FCIC gives the following information: «The derivatives markets are organized as exchanges or as over-the-counter (OTC) markets, although some recent electronic trading facilities blur the distinctions. The oldest U.S. exchange is the Chicago Board of Trade, where futures and options are traded. Such exchanges are regulated by federal law and play a useful role in price discovery—that is, in revealing the market's view on prices of commodities or rates underlying futures and options. OTC derivatives are traded by large financial institutions—traditionally, bank holding companies and investment banks—which act as derivatives dealers, buying and selling contracts with customers. Unlike the futures and options exchanges, the OTC market is neither centralized nor regulated. Nor is it transparent, and thus price discovery is limited. No matter the measurement—trading volume, dollar volume, risk exposure—derivatives represent a very significant sector of the U.S. financial system.»

⁹³ GAO 1994 p. 7/9.

Achieving this balance will require unprecedented cooperation among U.S. and foreign regulators, market participants, and members of the accounting profession. GAO makes recommendations designed to help Congress, the regulators, and the industry address this issue.»⁹⁴

The report has recommendations for Congress, supervisors and FASB.^{95, 96} Together with the remarks already quoted, the report shows that an authoritative institution warned already in 1994 on solid grounds for a scenario like that of September 2008. It shows that an authoritative institution made recommendations which, if implemented, would have prevented the crisis. Because of their importance and to make this book more or less self-sufficient they are quoted in full.

«Recommendations to Congress.

Given the weaknesses and gaps that impede regulatory preparedness for dealing with a crisis associated with derivatives, we recommend that Congress require federal regulation of the safety and soundness of all major U.S. OTC derivatives dealers. Regulators should attempt to prevent financial disruptions from turning into crises and resolve crises to minimize risks to the financial system. Thus, firms that become insolvent should be allowed to fail but to do so in an orderly fashion.

The immediate need is for Congress to bring the currently unregulated OTC derivatives activities of securities firm and insurance company affiliates under the purview of one or more of the existing federal financial regulators and to ensure that derivatives regulation is consistent and comprehensive across regulatory agencies. This could be done in several ways. For example, one legislative proposal would accomplish this goal by assigning the responsibility for the unregulated entities to SEC and creating an interagency commission to establish principles and standards for each federal financial regulator to use in supervising derivatives activities. Another approach could be based on the concept that underlies the arrangement established for government securities dealers. Under this concept, lead responsibility for setting principles and standards applicable to all major U.S. derivatives dealers would be divided among existing agencies on the basis of their expertise and mission. Extensive consultation with all of the agencies supervising derivatives activities would be required before any principles or standards were adopted.

We also recommend that Congress begin systematically addressing the need to revamp and modernize the entire US. financial regulatory system. Gaps and weaknesses in OTC derivatives regulation clearly demonstrate that the existing regulatory structure has not kept pace with the dramatic and rapid changes in the domestic and global financial markets. Banking, securities, futures, and insurance are no longer separate and distinct industries that can be well regulated by the existing patchwork quilt of federal and state agencies. Many issues need to be debated and decided, including the appropriate uses of federally insured deposits and the extent to which they should be used to finance activities, such as large-scale proprietary trading in derivatives or other financial instruments. One of the first issues that needs to be addressed is how the U.S. regulatory system should be restructured to better reflect the realities of today's rapidly evolving global financial markets. We recommend that the committees of jurisdiction work together on this issue. In addition, these committees should hold hearings, at least annually, on developments that affect the safety, soundness, and stability of the U.S. financial system.»

«Recommendations to Financial Regulators.

We recommend that the appropriate regulatory authorities take the following actions to improve their capability to oversee OTC derivatives activities and to anticipate and respond to any financial crisis involving derivatives. Developing specific solutions should involve working closely with industry representatives to:

- Develop and maintain accurate, current, and centralized information, that is accessible to all regulators, including information on the extent of major OTC dealers' counterparty concentrations and the sources and amounts of their derivatives earnings.

⁹⁴ GAO 1994 pp. 8-9/10-11.

⁹⁵ FASB= Financial Accounting Standards Board.

⁹⁶ The recommendations can be found on pp. 14-16/16-18 of the GAO 1994 report.

- Develop and adopt a consistent set of capital standards for OTC derivatives dealers sufficient to ensure that all of the major risks associated with derivatives as well as legally enforceable netting agreements are reflected in capital.
- Establish specific requirements for independent, knowledgeable audit committees and internal control reporting for all major OTC derivatives dealers. Internal control reporting by boards of directors, managers, and external auditors should include assessments of derivatives risk-management systems.
- Perform comprehensive, annual examinations of the adequacy of major OTC derivatives dealers' risk-management systems, using a consistent set of standards established for this purpose and including consideration of the internal control assessments performed by boards of directors, management, and auditors.
- Provide leadership in working with industry representatives and regulators from other major countries to harmonize disclosure; capital, legal requirements including netting enforceability; and examination and accounting standards for derivatives.»

«Recommendations to FASB.

We recommend that FASB:

- Proceed expeditiously to issue the existing exposure draft on disclosures of derivatives and fair value of financial instruments.
- Proceed expeditiously to develop and issue an exposure draft that provides comprehensive, consistent accounting rules for derivative products, including expanded disclosure requirements that provide additional needed information about derivatives activities.
- Consider adopting a market value accounting model for all financial instruments, including derivative products.»

«Recommendations to SEC.

We recommend that SEC:

- Ensure that SEC registrants that are major end-users of complex derivative products establish and implement corporate requirements for independent, knowledgeable audit committees and public reporting on internal controls. Internal control reporting by boards of directors, managers, and external auditors should include assessments of derivatives risk-management systems.
- Ensure that FASB proceeds expeditiously to develop and adopt comprehensive, consistent accounting rules and disclosure requirements for derivative products.»

Note that most recommendations do not concern only the USA, but for example also governments, supervisors and accountants in other countries. Note furthermore that BIS, IMF and every international organization having a responsibility with respect to the stability of the financial system could and should have acted on (at least) the last recommendation for the financial regulators.

Under 1996 the reader will find a summary of the report of the GAO about the implementation of its recommendations.

In 1994 HUD begins to sign "best practices" agreements with lenders:

«Since 1994, HUD has signed Fair Lending Best Practices (FLBP) Agreements with lenders across the nation that are individually tailored to public-private partnerships that are considered on the leading edge. The Agreements not only offer an opportunity to increase low-income and minority lending but they incorporate fair housing and equal opportunity principles into mortgage lending standards. These banks and mortgage lenders, as represented by Countrywide Home Loans, Inc., serve as industry leaders in their communities by demonstrating a commitment to affirmatively further fair lending.»⁹⁷

⁹⁷ Footnote 175 of 1994-D on p. 68 of Pinto.

«HUD’s Best Practices Initiative was agreed to by the Mortgage Bankers Association of America and undertaken by HUD in 1994 after HUD threatened to go to Congress to get CRA broadened to apply to mortgage bankers.»⁹⁸

«Countrywide [...] would ultimately announce \$1 trillion in Best Practices commitments.»⁹⁹

These observations are also of interest in connection with the following two assertions of the FCIC:

- 1) that the GSEs followed Wall Street, and
- 2) that the easing of mortgage requirements was motivated mostly or only by the pursuit of gain.¹⁰⁰

1995.

«CRA regulations are revised to be more quantitative and outcome based. A bank’s performance was [to be] compared to its market competitors. Banks were [to be] measured on their use of “innovative and flexible” lending standards. [...] Large banks desiring an “outstanding” rating needed to outperform their competitors. [This competition principle] helps explain the dramatic growth of CRA commitments over the next 12 years. Announced CRA commitments totaled \$4.5 trillion over the 1995-2006, 75 times the commitment volume for the 18 year period 1977-1994. [...]

CRA helps promote “too big to fail institutions” by rewarding banks that loosened their underwriting standards with the ability to consummate mergers. Ninety-four percent of the \$4.5 trillion in post-1995 CRA commitments reported by the National Community Reinvestment Coalition related to just 4 banks and banks they merged with. This demonstrates that bankers chose loosened underwriting in order to facilitate mergers. The four banks were Bank of America, Citibank, JP Morgan Chase, and Wells Fargo.»¹⁰¹

«In 1995 HUD announced HUD’s “National Homeownership Strategy [- Partners in the American Dream]¹⁰²”. HUD announced that it had “forged a nationwide partnership that will draw on the resources and creativity of lenders, builders, real estate professionals, community-based nonprofit organizations, consumer groups, State and local governments and housing finance agencies, and many others in a cooperative, multifaceted campaign to create ownership opportunities and reduce the barriers facing underserved populations and communities.” The goal was to make “financing more available, affordable, and flexible”.»¹⁰³

«The Strategy was prepared by HUD, “under the direction of Secretary Henry G. Cisneros, in response to a request from President Clinton.” The first paragraph of Chapter 1 stated: “The purpose of the National Homeownership Strategy is to achieve an all-time high level of homeownership in America within the next 6 years through an unprecedented collaboration of public and private housing industry organizations.”»¹⁰⁴

According to HUD:

«Lending institutions, secondary market investors, mortgage insurers, and other members of the partnership should work collaboratively to reduce homebuyer downpayment requirements. [...] The amount of borrower equity is an important factor in assessing mortgage loan quality. However, many low-income families do not have access to sufficient funds for a downpayment. While members of the partnership have already made significant strides in reducing this barrier to home purchase, more must be done. In 1989 only 7 percent of home mortgages were made with less than 10 percent

⁹⁸ Pinto p. 68, 1994-D.

⁹⁹ Pinto p. 68, 1994-D.

¹⁰⁰ Of course, the GSE law of 1992 and the quotes from speeches of US presidents have already shown that politics is at least involved.

¹⁰¹ Pinto 1995-A pp. 69-70.

¹⁰² *National Homeownership Strategy- Partners in the American Dream* seems to be the full name of the program. See for example note 191 on p. 73 of Pinto.

¹⁰³ Footnote 192 on p. 73 of Pinto.

¹⁰⁴ FCIC Wallison report pp. 491-2/519-20.

downpayment. By August 1994, low downpayment mortgage loans had increased to 29 percent.»¹⁰⁵

Pinto concludes that in 1992-1995 HUD succeeded to change the mortgage market radically. According to him, its success was made possible by the following four factors:

1. «The GSEs' affordable housing mission was under HUD's regulatory control pursuant to the GSE Act;
2. Banks' CRA activities were under the control of their safety and soundness regulators, who announced new CRA performance based regulations in 1995;
3. Mortgage bankers had voluntarily agreed to HUD's Best Practices initiative in late-1994; and
4. FHA was, of course, a part of HUD.»¹⁰⁶

The Madrid EU summit approves a plan for the transition to a single currency. It agrees on the name of the new currency: the euro. The transition will take place in three stages. The third and last will begin 1/1/99.

1996.

«In January 1996, the Community Reinvestment Act (CRA) regulation, revised to reward performance, not process, became effective for thousands of community banks in the United States.»¹⁰⁷

«Eighty-seven percent of the increase in low- and moderate-income goals from 1996 to 2007 was due to increases in the Special Affordable goals (low- and very low-income group).»¹⁰⁸

The deregulation policy continues unabatedly. This year, an Economic Growth and Regulatory Paperwork Reduction Act comes into force. It prescribes regulators «to review their rules every decade and solicit comments on “outdated, unnecessary, or unduly burdensome” rules.»¹⁰⁹

In November the GAO reports about the implementation of the recommendations of its report *Financial derivatives* of May 1994. The following is quoted from the Executive Summary:

«A number of actions have been taken or proposed since 1994 that are consistent with the recommendations that GAO made in its 1994 report. However, GAO notes that its key recommendations to improve corporate governance and internal controls for major derivatives dealers and end-users, close regulatory gaps, establish comprehensive and consistent accounting standards, and harmonize regulatory and accounting standards internationally have yet to be fully implemented. While GAO is making no new recommendations in this report, it believes that regulators, accounting standards-setters, and others need to continue to take actions necessary to completely respond to the intent of its prior recommendations.»¹¹⁰

The implementation of the recommendations for Congress is summarized as follows:

«Six derivatives-related bills were introduced in Congress in 1994. These bills included proposals to

- regulate derivatives activity and promote uniformity of such regulation;
- require increased disclosure about derivatives activity;

¹⁰⁵ Quote from HUD's *National Homeownership Strategy- Partners in the American Dream*. Pinto pp. 73-4, 1995-E.

¹⁰⁶ Pinto p. 74, 1995-E.

¹⁰⁷ Pinto 1996-C op p. 82.

¹⁰⁸ Pinto 1997-A op p. 85.

¹⁰⁹ FCIC report p. 53/81.

¹¹⁰ GAO 1996 report p. 15/17.

- require that GAO study the speculative uses of derivatives and the feasibility of imposing taxes and margin requirements on speculative derivatives activity;
- establish principles and standards related to accounting, customer suitability, and risk management;
- require derivatives dealers to register with SEC; and
- prohibit depository institutions from using derivatives for speculation.

None of these bills were passed.

As of June 30, 1996, four new derivatives-related bills were introduced. These bills included proposals to

- establish a federal derivatives commission to set principles and standards for the supervision of derivatives activities;
- authorize the Federal Reserve to create a self-regulatory organization whose members would include derivatives dealers not under the direct regulation of SEC or CFTC;
- require regulatory agencies to jointly establish principles and standards relating to capital, accounting, disclosure, customer suitability, and risk management;
- require financial institutions to have a management plan that ensures appropriate management oversight;
- establish prudent standards for managing risk and provide a framework for internal controls;
- require that all derivatives dealers register and be subject to SEC regulation; and
- prohibit depository institutions and credit unions from engaging in certain derivatives activities.

As of July 1996, all four of the bills had been referred to committee with no further action taken.»¹¹¹

In 2010, the FCIC explains this with the following observation:

«While Congress then [= after the publication of the GAO 1994 report] held hearings on the OTC derivatives market, the adoption of regulatory legislation failed amid intense lobbying by the OTC derivatives dealers and opposition by Fed Chairman Greenspan.»¹¹²

A Market Risk Amendment to Basel I stimulated the use of derivatives:

«In 1996, large banks sought more favorable capital treatment for their trading, and the Basel Committee on Banking Supervision adopted the Market Risk Amendment to Basel I. This provided that if banks hedged their credit or market risks using derivatives, they could hold less capital against their exposures from trading and other activities.»¹¹³

1997.

«HUD commissioned the Urban Institute in 1997 to study Fannie and Freddie's credit guidelines. It advised: [...]

“Informants did express concerns about some of the GSEs' practices. The GSEs' guidelines, designed to identify creditworthy applicants, are more likely to disqualify borrowers with low incomes, limited wealth, and poor credit histories; applicants with these characteristics are disproportionately minorities.”

Translation—do away with the Three Cs of Mortgage Credit entirely and mortgage lending practices would be greatly improved. By 2000 the GSEs had done away with downpayments, had raised debt

¹¹¹ GAO 1996 report pp. 31-2/33-4.

¹¹² FCIC report p. 47/75.

¹¹³ FCIC report p. 49/77. The discussion about the accommodation of market risk had already started in 1991. See chapter 2 of Balthazar. His book can be found in the directory BIS/Basel, under 20061231.

ratios, entered the “A-minus” and “B” subprime market and re-entered the low doc/no doc market.»¹¹⁴,
¹¹⁵

On 17/6/97 the Amsterdam EU summit approves a Stability and Growth Pact (SGP). The SGP is an agreement among the EU member states to facilitate and maintain the stability of the Economic and Monetary Union (EMU). It is intended to ensure that the EU member states maintain budgetary discipline after the single currency has been introduced. It is based primarily on Articles 121 and 126 of the Treaty on the Functioning of the European Union. Art. 121 outlines the preventive part of the SGP. Art. 126 forms the basis for the corrective part and the “Excessive Deficit Procedure” (EDP). Protocol 12 defines the reference values of 3% of GDP for public deficit and 60% of GDP for government debt. It provides for monitoring of government finances of member states by the European Commission and the Council of Ministers, and the issuing of a yearly recommendation for policy actions to ensure full compliance with the SGP also in the medium-term. If a member state breaches the SGP's limits for government deficit and debt, the surveillance and request for corrective action will intensify through the declaration of an EDP. If in spite of multiple warnings corrective actions are not taken, member state can ultimately be issued economic sanctions.^{116, 117}

1998.

«The goals of HUD’s best Practices Initiative (now encompassing over 117 mortgage bankers) was described [by HUD] as follows:

“The companies and associations that sign “Best Practices” Agreements not only commit to meeting the responsibilities under the Fair Housing Act, but also make a concerted effort to exceed those requirements. In general, the signatories agree to administer a review process for loan applications to ensure that all applicants have every opportunity to qualify for a mortgage. They also assent to making loans of any size so that all borrowers may be served and to provide information on all loan programs for which an applicant qualifies.... The results of the initiative are promising. As lenders discover new, untapped markets, their minority and low-income loans applications and originations have risen. Consequently, the homeownership rate for low-income and minority groups has increased throughout the nation. However a near 30% gap currently exists between the homeownership rate of white Americans and their African-American and Hispanic counterparts. In an effort to reduce this disparity, HUD signed “Best Practices” Agreements with an additional 7 lending institutions in FY 1998. Furthermore, 10 expired agreements were resigned.”»¹¹⁸

The Annual report 2007 of the National Community Reinvestment Coalition (NCRC) gives the following information about 1998:

«1998 was a year of mega-mergers that included the Bank of America and Nations Bank merger as well as Citigroup’s acquisition of Travelers; CRA pledges totaled \$812 billion as a result.»¹¹⁹

T. Day en S. Liebowitz, working at the University of Texas at Dallas, have doubts about the soundness of the policy of HUD, and point out the risks it causes for its beneficiaries:

«After the warm and fuzzy glow of ‘flexible underwriting standards’ has worn off, we may discover that they are nothing more than standards that led to bad loans. Certainly, a careful investigation of these underwriting standards is in order. If the ‘traditional’ bank lending processes

¹¹⁴ “low doc/ no doc” refers to the requirement to provide documentation when applying for a mortgage. “low doc/ no doc” means that this requirement is partly or wholly waived.

¹¹⁵ Pinto pp. 86-7, 1997-B.

¹¹⁶ The text of the pact could not be found. The paragraph is based on descriptions or (supposed) summaries, http://ec.europa.eu/economy_finance/economic_governance/sgp, the Wikipedia page *Stability and Growth Pact* of 27/6/14, and Public finances in EMU 2009 _EC.pdf. The available files can be found in the directory EU/Euro.

¹¹⁷ Note that sanctions will probably increase both deficit and debt, contrary to its supposed purpose.

¹¹⁸ Pinto p. 90, 1998-A. The quote comes from HUD’s *Building Communities and New Markets for the 21st Century*, FY 1998 Report, p. 75.

¹¹⁹ Quoted by Pinto on p. 90, in 1998-B.

were rational, we are likely to find, with the adoption of flexible underwriting standards, that we are merely encouraging banks to make unsound loans. If this is the case, current policy will not have helped its intended beneficiaries if in future years they are dispossessed from their homes due to an inability to make their mortgage payments. It will be ironic and unfortunate if minority applicants wind up paying a very heavy price for a misguided policy based on badly mangled data.»¹²⁰

«Bear Stearns begins packaging CRA loans into Fannie, Freddie and private securities. It reported the average CRA portfolio has:

- at least 30 percent loans with 5% down or less;
- a high percentage of loans with less than a 660 FICO score (20-25%). A disproportionately large percentage can be below a 620 FICO score; and
- a high percentage of loans with “favorable” (flexible) underwriting standards.

Banks were advised:

- “Forget about FICO scores and high LTV levels. Almost everyone evaluating your portfolio assumes that the scores will be low (many 660 and less) and LTVs will be high (90 percent and greater);” and
- “Mortgage insurance is a "nice to have" amenity, but not a "need to have;" credit enhancements can be added later through subordinated securities.”

Notwithstanding FHA’s poor experience over decades with respect to similar loans, Bear Stearns, the GSEs, and others adopted the view espoused by community groups:

“To many lower-income homeowners and CRA borrowers, being able to own a home is a near-sacred obligation.”»¹²¹

In May 1998 the Commodity Futures Trading Commission (CFTC), one of the principal financial supervisors of the USA, tried to initiate a process aimed at improving the regulation of the OTC market.¹²² The initiative was killed by a combination of the federal government, including Congress, and the heads of the two most important US financial supervisors: the Fed and SEC. The following is the story as told by the FCIC:

«In 1996, Japan’s Sumitomo Corporation lost \$2.6 billion on copper derivatives traded on a London exchange. The CFTC charged the company with using derivatives to manipulate copper prices, including using OTC derivatives contracts to disguise the speculation and to finance the scheme. Sumitomo settled for \$150 million in penalties and restitution. The CFTC also charged Merrill Lynch with knowingly and intentionally aiding, abetting, and assisting the manipulation of copper prices; it settled for a fine of \$15 million.

Debate intensified in 1998. In May, the CFTC under Chairperson Brooksley Born said the agency would reexamine the way it regulated the OTC derivatives market, given the market’s rapid evolution and the string of major losses since 1993. The CFTC requested comments. It got them.

Some came from other regulators, who took the unusual step of publicly criticizing the CFTC. On the day that the CFTC issued a concept release, Treasury Secretary Robert Rubin, Greenspan, and SEC Chairman Arthur Levitt issued a joint statement denouncing the CFTC’s move: “We have grave concerns about this action and its possible consequences. . . . We are very concerned about reports that the CFTC’s action may increase the legal uncertainty concerning certain types of OTC derivatives.” They proposed a moratorium on the CFTC’s ability to regulate OTC derivatives.

For months, Rubin, Greenspan, Levitt, and Deputy Treasury Secretary Lawrence Summers opposed the CFTC’s efforts in testimony to Congress and in other public pronouncements. As Alan Greenspan said: “Aside from safety and soundness regulation of derivatives dealers under the banking and securities laws, regulation of derivatives transactions that are privately negotiated by professionals

¹²⁰ Quoted by Pinto in 1998-G on p. 91. Note that this is more a logically-correct common sense argument than a (political) opinion.

¹²² For explanation of “OTC” please see the OTC-note under 1994.

is unnecessary.”»¹²³

September 1998 was the month of the LTCM near-crisis.¹²⁴ Between January and September 1998, LTCM, one of the largest US hedge funds, lost almost 90 percent of its capital.¹²⁵ The main events of the mini-crisis can be summarized as follows:

January	LTCM’s net asset value is \$4.67 billion. LTCM’s 16 partners’ investment in the fund is valued at about \$1.6 billion.
February-August	Due to various events, LTCM’s net asset value declines to \$2.3 billion.
Early September	LTCM partners contact Federal Reserve officials to notify them of their difficulties and their discussion with investment houses about plans to raise new capital.
September 19	The President of the NY Fed advises the Chairman of the Fed that the LTCM situation appears to be deteriorating and that efforts to raise capital had failed. The Chairman agrees that a team should visit LTCM to get a better understanding of the situation.
September 20	Federal Reserve led team visited Greenwich (CT) for LTCM’s presentation.
September 21	Federal Reserve Bank of New York contacted Goldman Sachs, Merrill Lynch, and J.P. Morgan officials (LTCM’s major creditors). LTCM experiences a single-day trading loss of \$500 million. Bear Stearns, LTCM’s clearing agent, sets a new condition that requires LTCM to collateralize potential settlement exposures.
September 22	Goldman Sachs, Merrill Lynch, J.P. Morgan, and UBS (the “core group”) dispatch two working groups to Greenwich to consider lifting the fixed-income and equity positions out of LTCM. A third group meets at one of the firms in New York to develop a “Consortium approach”. Later that evening, Federal Reserve officials contact additional LTCM creditors. That night, in addition to the core group, a meeting of a larger group involving 13 additional firms begins. Members of the core group contact LTCM about the conditions of the Consortium approach.
September 23	Federal Reserve officials call various foreign central bank officials to inform them about LTCM. Federal Reserve officials suspend the effort to proceed with the Consortium approach until an alternative offer can be considered. At 12:30 p.m., officials find out that the alternative offer was not accepted nor will the offer be extended. Treasury notifies CFTC about LTCM’s problems. CFTC sends an audit staff to LTCM as well as to Bear Stearns and Merrill Lynch to inspect LTCM’s accounts. The staff of the President’s Working Group holds a telephone conference to discuss LTCM. The 14 members of the Consortium agree to the terms of the agreement and LTCM accepts the offer.
September 28	Closing date on the agreement reached among the Fund, the Investment Vehicles, LTCM and its affiliates, and the 14 members of the Consortium. Consortium members infuse \$3.6 billion into the fund. One condition of the agreement is that the Management Company agrees to provide management investment services to the Consortium’s Investment Vehicle on the basis of a 1 percent per annum management fee and a 15 percent incentive fee for increases in net asset value over a Libor hurdle rate. Representatives of the Consortium meet and formally constitute themselves as the Board of Directors of “Oversight Partner I LLC.”

¹²³ FCIC report pp. 46-7/74-5. The film (documentary) *Inside job* provides valuable additional information. Brooksley Born was phoned by undersecretary Summers, and pressured to withdraw her proposal. The film also shows fragments of the discussion in Congress. *Inside Job* was produced by Audrey Marrs and Charles Ferguson, and directed by Charles Ferguson.

¹²⁴ LTCM= Long term capital management. LTCM was a hedge fund.

¹²⁵ GAO 1999 report, p. 2/3.

November Stake of the 16 original partners valued at \$30 million (as against \$1.6 billion at the beginning of the year).
(All dates refer to 1998).

The above summary is based on the Chronology of Events on pp. 39-40/41-2 of the GAO report *LTCM: Regulators Need to Focus Greater Attention on Systemic Risk*.¹²⁶ It is given also to show how the crisis is “solved”.

The report gives the following explanation and evaluation of the events:

«LTCM was able to establish leveraged trading positions of a size that posed potential systemic risk, primarily because the banks and securities and futures firms that were its creditors and counterparties failed to enforce their own risk management standards. Other market participants and federal regulators relied upon these large banks and securities and futures firms to follow sound risk management practices in providing LTCM credit. However, weaknesses in the risk management practices of these creditors and counterparties allowed LTCM’s size and use of leverage to grow unrestrained. According to federal financial regulators, these weaknesses, at least in part, resulted from overreliance on the reputations of LTCM’s principals, the relaxing of credit standards that typically occurs during periods of sustained economic prosperity, and competition between banks and securities and futures firms for hedge fund business.

The effects of these weaknesses became apparent during the unsettled market conditions that occurred in the summer of 1998. LTCM began to lose large amounts of money—\$1.8 billion in August alone—in various trading positions worldwide and by mid-September was on the verge of failure. The Federal Reserve facilitated a private sector recapitalization of LTCM because of concerns that a rapid liquidation of LTCM’s trading positions and related positions of other market participants in already highly volatile markets might cause extreme price movements and cause some markets to temporarily cease functioning. Following the LTCM crisis, a group of major financial firms prepared a report that addressed risk management issues and recommended improvements to financial firms’ existing counterparty risk practices.¹²⁷

Federal financial regulators did not identify the extent of weaknesses in banks’ and securities and futures firms’ risk management practices until after LTCM’s near-collapse. Although regulators were aware of the potential systemic risk that hedge funds can pose to markets and the perils of declining credit standards, until LTCM’s near-collapse, they said they believed that creditors and counterparties were appropriately constraining hedge funds’ leverage and risk-taking. However, examinations done after LTCM’s near-collapse revealed weaknesses in credit risk management by banks and broker-dealers that allowed LTCM to become too large and leveraged. The existing regulatory approach, which focuses on the condition of individual institutions, did not sufficiently consider systemic threats that can arise from nonregulated entities, such as LTCM. Similarly, information periodically received from LTCM and its creditors and counterparties did not reveal the potential threat posed by LTCM.»¹²⁸

The end of 1998 is the beginning of stage 3 of the plan for the EU Economic and Monetary Union agreed to at the Madrid summit of 1995:

«On 31 December 1998, the conversion rates between the euro and the currencies of the participating EU countries were irrevocably fixed. On 1 January 1999, the euro was introduced and the Eurosystem, composed of the ECB and the national central banks (NCBs) of the euro area countries, took over responsibility for monetary policy in the new euro area. This was the beginning of a transitional period that was to last three years and end [on 1/1/2002] with the introduction of euro banknotes and coins and the withdrawal of national banknotes and coins.»¹²⁹

Henceforth the euro is legal tender. Until 1/1/2002 the euro can be used only for cashless payments

¹²⁶ The report can be found in the directory USA/GAO, under 19991031. For clarification see especially pp. 44-5/46-7.

¹²⁷ This was the Counterparty Risk Management Policy Group (CRMPG), which we will meet again. Its report can be found under 19990621 in the dossier. (The date is adopted from the GAO LTCM report).

¹²⁸ Pp. 2-3/4-5 of the GAO 1999 report.

¹²⁹ *The road to the euro*, p. 8.

(cheques, transfers, bank cards). Payments to tax and social security authorities can be made in national currency or euros: there is no prohibition and no compulsion regarding the use of the single currency.¹³⁰ Financial markets changed immediately.¹³¹

1999.

«FHA doubles its percentage of loans with a downpayment of <5% in one year, from 23% in 1998 to 44% in 1999 and increases its home purchase share from 12% to 15%.»¹³²

The following table shows that in 1999-2007 the share of LTVs > 95% in mortgages acquired by Fannie and Freddie increased by a factor of about 5.¹³³

Chart 29 - Affordable Housing Goals and Fannie and Freddie's Acquisition of Loans with LTVs >95% (Green highlight indicates richer in goals contribution relative to low- and moderate-income goal):

LTVs >95%	1999	2000	2001	2002	2003	2004	2005	2006	2007

«On July 29, 1999, HUD issued a press release with the heading “Cuomo Announces Action to Provide \$2.4 trillion in Mortgages for Affordable Housing for 28.1 Million Families.” The release began: “Housing and Urban Development Secretary Andrew Cuomo today announced a policy to require the nation's two largest housing finance companies to buy \$2.4 trillion in mortgages over the next 10 years to provide affordable housing for about 28.1 million low- and moderate-income families.”

“Cuomo said the historic action by HUD raises the required percentage of mortgage loans for low- and moderate-income families that finance companies Fannie Mae and Freddie Mac must buy from the current 42 percent of their total purchases to a new high of 50 percent- a 19 percent increase- in the year 2001. The percentage will first increase to 48 percent in 2000 [while the planned 2000 increase was not promulgated, both Fannie and Freddie exceeded the planned increase with a 50% attainment].”

“Commenting on the action, President Clinton said: ‘During the last six and a half years, my Administration has put tremendous emphasis on promoting homeowners and making housing more affordable for all Americans. Our housing programs and institutions have been a success. Today, the homeownership rate is at an all-time high, with more than 66 percent of all American families owning their homes. Today, we take another significant step. Raising the GSEs goals will help us generate increased momentum in addressing the nation's housing needs.’”

¹³⁰ A brief history of the euro, from the website of the Belgian National Bank, nbb.be.

¹³¹ The road to the euro, p. 8.

¹³² Pinto p. 93,1999-A, based on the FHA study of 2009.

¹³³ Pinto p. 94, 1999-B.

“Under the higher goals, Fannie Mae and Freddie Mac will buy an additional \$488.3 billion in mortgages that will be used to provide affordable housing for 7 million more low- and moderate-income families over the next 10 years. Those new mortgages and families are over and above the \$1.9 trillion in mortgages for 21.1 million families that would have been generated if the current goals had been retained.”

“Fannie Mae Chairman Franklin D. Raines joined Cuomo at the news conference in which Cuomo announced the HUD action. Raines committed Fannie Mae to reaching HUD's increased Affordable Housing Goals.”»¹³⁴

In April 1999 the President's Working Group on Financial Markets (PWG) published a report *Hedge Funds, Leverage, and the Lessons of Long-Term Capital Management*. The side letter¹³⁵ to the chairpersons of Senate and House contains the following paragraphs:

«The principal policy issue arising out of the events surrounding the near collapse of LTCM is how to constrain excessive leverage. By increasing the chance that problems at one financial institution could be transmitted to other institutions, excessive leverage can increase the likelihood of a general breakdown in the functioning of financial markets. This issue is not limited to hedge funds; other financial institutions are often larger and more highly leveraged than most hedge funds.

In view of our findings, the Working Group recommends a number of measures designed to constrain excessive leverage. These measures are designed to improve transparency in the system, enhance private sector risk management practices, develop more risk-sensitive approaches to capital adequacy, support financial contract netting in the event of bankruptcy, and encourage offshore financial centers to comply with international standards.»¹³⁶

The following is the operational part of the executive summary of the report:

«Our market-based economy relies primarily on market discipline to constrain leverage. But market discipline can break down. In the case of LTCM, its investors, creditors, and counterparties did not provide an effective check on its overall activities. Moreover, some of the same market and credit risk management weaknesses that permitted LTCM to achieve its extraordinary leverage were evident in other market participants. In the immediate aftermath of LTCM's near collapse, credit risk management practices vis-a-vis highly leveraged institutions were tightened. But market history indicates that even painful lessons recede from memory with time.

Therefore, the Working Group recommends the following measures:

- More frequent and meaningful information on hedge funds should be made public.
- Public companies, including financial institutions, should publicly disclose additional information about their material financial exposures to significantly leveraged institutions, including hedge funds.
- Financial institutions should enhance their practices for counterparty risk management.
- Regulators should encourage improvements in the risk-management systems of regulated entities.
- Regulators should promote the development of more risk-sensitive but prudent approaches to capital adequacy.
- Regulators need expanded risk assessment authority for the unregulated affiliates of broker-dealers and futures commission merchants.
- The Congress should enact the provisions proposed by the President's Working Group to support financial contract netting.
- Regulators should consider stronger incentives to encourage offshore financial centers to comply with international standards.

¹³⁴ This is a combination of FCIC Wallison report p. 495/523 and Pinto p. 94-5, 1999-C. Pinto quotes a press release by HUD of 29/7/99. The rectangular brackets are in Pinto.

¹³⁵ Signed by Rubin (Treasury), Levitt (SEC), Greenspan (Fed) and Born (CFTC).

¹³⁶ The report can be found in the directory USA/Fed, under 19990430. (The downloaded file has not been reformatted). The analysis of the PWG is seriously incomplete, if not incorrect. For explanation see Part 2 of this chapter.

The Working Group will be monitoring and assessing the effectiveness of the measures outlined above. If further evidence emerges that indirect regulation of currently unregulated market participants is not effective in constraining excessive leverage, there are several matters that could be given further consideration; however, the Working Group is not recommending any of them at this time.

Concerns have been expressed about the activities of highly leveraged institutions with respect to their impact on market dynamics generally and vulnerable economies in particular. Such activity can affect markets in some circumstances and for limited periods although, as a number of independent studies that have been undertaken so far have suggested, the activities of highly leveraged institutions do not appear to have played a significant role in precipitating the financial market crises of the past few years. Further study of this issue will be undertaken by the Financial Stability Forum, recently established by the G-7.»

Note that the PWG asserts that leverage is the single most important factor, and that it completely ignores the analysis of the GAO of 1994. And don't forget that at the time of writing the LTCM report, the members of the PWG, except of course the CFTC, refuse to even discuss regulating OTC.

No reports of the "monitoring and assessing the effectiveness of the measures" have been found.

Various later documents show that nothing meaningful was done with the recommendations.

«Under heavy pressure from the financial lobby, legislation prohibiting regulation of derivatives by Born's agency [= CFTC] was passed by the Congress. [Chairperson Brooksley] Born resigned on June 1, 1999.»¹³⁷

In October 1999 the report *LTCM: Regulators Need to Focus Greater Attention on Systemic Risk* of the GAO is published. It is addressed to the Congressional Requesters. It is the report of an inquiry into the near-collapse of LTCM and some of the broader issues it raised. The title of the report leaves no room for misunderstanding. The message can only be missed if the report is missed. The FCIC report mentions the GAO 1999 report twice. But only in the endnotes.¹³⁸

The report gives clear and indisputable analyses of the relevant events and phenomena. It would be difficult to make it more convincing. Its content is not only important as such, but also because it proves that an open analysis of the facts shows what may happen (and did happen), and what can be done to prevent a disaster. The report gives a thoroughly substantiated warning for almost everything that caused the financial crisis of 2007-2008.

The titles of the sections of the side-letter of the report compose its shortest summary:

1. «Lapses in Market Discipline Enabled LTCM to Have Large, Leveraged Trading Positions, Creating Potential Systemic Risk;
2. Market Discipline Did Not Constrain LTCM's Leverage and Risk-taking;
3. The LTCM Crisis Illustrated that Potential Systemic Risk Can Exist in Large Trading Positions;
4. After the Crisis, Major Financial Firms Proposed Improved Risk Standards;
5. Regulatory Oversight Did Not Identify Lapses in Risk Management Practices and the Threat Posed by LTCM;
6. Federal Regulators Had Expressed General Concerns About Hedge Funds for Years;
7. Regulators Did Not Identify Weaknesses in Firms' Risk Management Practices Until After the Crisis;
8. Offsite Monitoring Did Not Reveal the Potential Systemic Threat Posed by LTCM;
9. Regulators and Industry Adopted and Recommended Improved Oversight and Practices;
10. Existing Coordination Could be Improved to Enhance Regulators' Ability to Identify Risks Across Industries and Markets;
11. Gap in SEC's and CFTC's Regulatory Authority Limits Their Ability to Identify and Mitigate Systemic Risk;
12. SEC and CFTC Lack Authority to Regulate Affiliates of Broker-Dealers and FCMs;¹³⁹

¹³⁷ Wikipedia, page Brooksley Born, 10/12/12. In the subdirectory USA/CFTC.

¹³⁸ Search the FCIC report for "focus greater attention".

¹³⁹ FCM= futures commission merchant.

13. Regulators Recommended Limited Expansion of SEC and CFTC Authority Over Activities of Affiliates of Broker-Dealers and FCMs, but Regulatory Gap Would Remain;
14. Expanding SEC and CFTC Authority Over Affiliates Would Raise Controversial Issues.»

The following paragraph of the report draws attention to dangerous negligence of regulators:

«Because of the blurring in recent years of traditional lines that separate the businesses of banks and securities and futures firms, it is more important than ever for regulators to assess information that cuts across these lines. **Regulators for each industry have generally continued to focus on individual firms and markets, the risks they face, and the soundness of their practices, but they have failed to address interrelationships across each industry.** The risks posed by LTCM crossed traditional regulatory and industry boundaries, and the regulators would have needed to coordinate their activities to have had a chance of identifying these risks. Although regulators have recommended improvements to information reporting requirements, they have not recommended ways to better identify risks across markets and industries. We are recommending that federal financial regulators develop ways to better coordinate oversight activities that cross traditional regulatory and industry boundaries.»¹⁴⁰

Or in slightly different words in the conclusions on p. 30:

«LTCM's crisis showed that the traditional focus of federal financial regulators on individual institutions and markets is not adequate to identify potential systemic threats that cross these institutions and markets. Developing ways to enhance coordination of activities related to identifying risks that cross traditional boundaries could better position these regulators to address potential systemic risk before it reaches crisis proportions.»¹⁴¹

The observation in boldface is confirmed by the annual reports of all financial regulators and supervisors. Including those of 2006-2008.¹⁴² On the understanding that the “continued to focus on” is interpreted as a diplomatic way of saying that they gave no attention at all to interrelationships. In other words: the truth would have been served better if “continued to focus on” had been replaced by “failed to look beyond”.

Another clear warning is the following:

«Gaps in SEC's and CFTC's regulatory authority impede their ability to observe and assess activities in securities and futures firms' affiliates that might give rise to systemic risk. Although the Federal Reserve's consolidated oversight of bank holding companies did not reveal banks' risk management weaknesses related to LTCM, recommended or already implemented improvements in examination focus and in information gathered may give bank regulators a better opportunity to identify future problems that might pose systemic risk. **Without similar authority over the consolidated activities of securities and futures firms, SEC and CFTC cannot contribute effectively to regulatory oversight of potential systemic risk, because a large and growing proportion of those firms' risk taking is in their unregulated affiliates.** The affiliates may have large positions in markets such as OTC derivatives and can be major providers of leverage in the markets, as they were in the LTCM case. How they manage their own risks, as well as their provision of leverage to counterparties, can affect the financial system.»¹⁴³

The report contains facsimile copies of the reactions of the regulators (supervisors) on the draft of the report. Because they illustrate the attitude and conduct of the regulators, and because their failure to respond properly and appropriately is essential for the explanation of the crisis of 2007-2008, the substantial parts of their reactions are reproduced below.

¹⁴⁰ GAO 1999 report p. 3/5. The boldface is by JFCvV.

¹⁴¹ GAO 1999 report p. 30/32.

¹⁴² These can all be found as pdf-file on their websites. Except that of OTS of 2006 (and earlier). They can also be found in their subdirectory in the directory USA. Excerpts can be found in the appendices bearing their names.

¹⁴³ GAO 1999 report pp. 30-1/32-3. The boldface is by JFCvV.

CFTC.¹⁴⁴

«As the draft report indicates, the President's Working Group on Financial Markets (PWG) recently issued a report that made several recommendations in light of this episode. These recommendations include action to promote greater disclosure of information- both disclosure by hedge funds about their own risk exposures and disclosure by financial institutions and other publicly-held companies about their dealings with hedge funds. This disclosure will increase market transparency and thus will enhance the ability of creditors, counterparties, investors, and other market participants to monitor, and to discipline, leverage and risk taking by hedge funds.

CFTC is working to implement those recommendations which are within its authority and has already begun working with other members of the PWG to address issues raised by the LTCM situation. Specifically, CFTC staff have developed possible models for disclosure of risk information by institutions whose size and leverage render them capable of posing potential systemic risk threats. These models would call for disclosure in a format that would be shared with other federal financial regulators and the public. CFTC is consulting with other members of the PWG concerning these models of disclosure. The goal is to reduce the likelihood of systemic risk by increasing transparency, thereby strengthening market discipline.»

The evaluation of the GAO of the CFTC reaction is concluded by the following sentences:

«As pointed out in our report, although market discipline is the primary mechanism for controlling risk-taking, LTCM's creditors and counterparties failed to apply it in LTCM's case. Thus, we continue to believe that market discipline should be supplemented by regulatory offsite monitoring and on-site examinations to help ensure the prompt identification and correction of weaknesses in risk management practices.»¹⁴⁵

Fed.¹⁴⁶

«The report recommends that the Federal Reserve and other federal financial regulators develop ways to coordinate the assessment of risks that cross traditional regulatory and industry boundaries. As you know, the President's Working Group was reinvigorated in 1994, in part to address coordination concerns, and the Board is committed to making the Working Group function effectively. The Board believes that the structure for coordinating currently is adequate. Although in certain cases there may be statutory limitations on the agencies' ability to share some information, legislative proposals under consideration would address any such limitations that may apply to the Board.

Broadly, the report's recommendation suggests that the federal financial regulators focus on developing data that might reveal potential systemic risks and then coordinate on the assessment of that risk. Identifying the particular types of data that might reveal potential systemic risk is a particularly challenging task, in no small measure because systemic crises tend to embody unique features that are hard to anticipate in advance.¹⁴⁷ Various working groups under the auspices of the Committee on the Global Financial System of the Group of Ten Central Banks and the Financial Stability Forum are struggling with trying to identify the types of data that might improve our understanding of the risks being taken in financial markets. We do not want to prejudge the results of such efforts, but the task is an extremely difficult one. In the final analysis, our ability to perceive systemic crises in data is likely to be limited. We, thus, fall back to our longstanding position, that the soundest course for financial regulators is to ensure that the institutions they supervise can withstand the shocks that inevitably occur in markets. To this end, federal financial regulators are working to strengthen further the risk management practices at the institutions they supervise.»

The last sentence of the evaluation of this reaction by the GAO is the following:

¹⁴⁴ The CFTC reaction is dated 14/10/99, and signed by William J. Rainer.

¹⁴⁵ GAO 1999 report pp. 31-2/33-4.

¹⁴⁶ The Fed reaction is dated 20/10/99, and signed by Alan Greenspan.

¹⁴⁷ This assertion is falsified by the GAO report of 1994.

«However, such oversight is not currently applied to all financial institutions that can originate or transmit risk and does not include effective ways to monitor and assess risks that cut across markets.»¹⁴⁸

SEC.¹⁴⁹

«As the scope of trading and credit activities conducted outside the regulated broker-dealer has expanded, the Securities and Exchange Commission ("SEC") has found it increasingly difficult to closely monitor the systemic risks posed by unregulated broker-dealer affiliates. Therefore, I believe the Draft Report accurately concludes that the SEC requires additional risk assessment authority over these unregulated affiliates. The finding also is consistent with the recommendations recently made in the report prepared by the President's Working Group on Financial Markets, *Hedge Funds, Leverage, and the Lessons of Long-Term Capital Management*.

In addition to our general comments on the conclusions reached in the Draft Report, we have the following three specific concerns:

First, the Draft Report compares, but does not distinguish, the leverage ratios of LTCM and several large securities firms. Though some securities firms had simple balance sheet leverage ratios (assets/equity capital) in the same range as LTCM, the assets carried by the securities firms were less volatile than the assets earned by LTCM. Moreover, securities firms are subject to regulatory capital requirements. Therefore, a general comparison of simple leverage ratios without further explanation may cause the misimpression that securities firms posed as much risk as LTCM.

Second, the Draft Report claims there is an inability of existing coordination methods to monitor risks across industry and market lines. I believe that productive avenues for sharing important information exist today. For example, the President's Working Group on Financial Markets provides an ongoing forum for the primary financial regulators to discuss issues cutting across jurisdictional boundaries. While the exchange of information between regulators can be improved to facilitate better cooperation and coordination, in my view the focus should be on public dissemination of information regarding hedge funds. The President's Working Group report therefore recommended that hedge funds should be required to publicly disclose information in the form of quarterly financial reports that include comprehensive measures of market risk. The SEC's staff also is working on a rule proposal to require public companies to disclose their direct material exposures to significantly leveraged financial institutions.

Third, the Draft Report claims that because of current limitations on the SEC's regulatory authority over broker-dealer affiliates, the SEC cannot fully assess the risk exposures of broker-dealers. The SEC, however, has sufficient information to assess and evaluate the risks incurred at the broker-dealer level. It is at the broader, broker-dealer holding structure level, which encompasses unregulated broker-dealer affiliates, that the SEC encounters difficulty in assessing risk.

In closing, while rigorous market discipline is an effective deterrent against market excesses and disruptions, the LTCM episode demonstrated that financial regulators need better tools to identify intermarket risks, especially those stemming from lapses in private market discipline. Thank you again for this opportunity to provide comments to the GAO as it prepares its final draft of the report.»

In its evaluation of this reaction the GAO notes among other things:

«Although we agree that hedge fund disclosures could be of some use, we believe that efforts should be made to improve regulatory coordination because future systemic problems may not involve hedge funds. Thus, we continue to support our recommendation that financial regulators find ways to better coordinate the assessment of risks that cross traditional regulatory and industry boundaries.

Finally, as to SEC's third issue, we continue to be concerned that SEC may be unable to fully assess risks to the broker-dealers because of its inability to oversee holding companies (and unregulated affiliates) of broker-dealers. For example, when broker-dealers are part of holding company structures, whose risk management function is located at the holding company level, SEC is unable to review that broker-dealers risk management system unless the holding company provides the

¹⁴⁸ GAO 1999 report p. 33/35.

¹⁴⁹ The SEC reaction is dated 18/10/99, and signed by Annette L. Nazareth.

information voluntarily.»¹⁵⁰

Treasury.¹⁵¹

«The draft report recommends that the Treasury, the Federal Reserve Board, the SEC, and the CFTC "develop ways to coordinate the assessment of risks that cross traditional regulatory and industry boundaries." We believe that such coordination is already occurring in the President's Working Group. The members of the Working Group meet on a regular basis- at both the principal and staff levels- and have developed a productive and candid multilateral environment for exchanging information on significant market developments. The process works well and our working relationships continue to grow and develop over time. While the Working Group is not itself a regulatory body, it serves as an important forum for federal financial regulators that better enables them to respond to market events in effective and appropriate ways.

Thank you again for this opportunity to review and comment on the draft report. We find that its factual presentation is in general agreement with our understanding of the events related to the LTCM episode.»

The second half of the evaluation of this reaction by the GAO is the following:

«As we stated previously, we agree that the President's Working Group serves as an important forum that better enables regulators to respond to market events, although primarily after the fact, but existing coordination efforts failed to allow regulators to identify the cross-industry risks that LTCM posed. Therefore, we continue to support our recommendation that the financial regulators develop better ways to coordinate the assessment of risks that cross traditional regulatory and industry boundaries.»¹⁵²

2000.

«In order to protect its market share, FHA increases the percentage of its loans with FICO scores below 660 from 42% in 1994 to 71% in 2000 and increases the percentage of its loans with an LTV \geq 97% from 14% in 1992 to 52% in 2000. This allows it to maintain its share at about 9% over 1993-2000, the same as its average share for 1990-1992.»¹⁵³

In January FHA publishes a press release about “Quicken [housing] loans”, in which it presents itself as an institution with easy mortgage requirements, and as being easier than other mortgage providers.¹⁵⁴

«FHA was setting the loosened underwriting standard with its greatly expanded reliance on minimal downpayments, raised the total debt-to-income bar to 41% and beyond on very low downpayment loans and it had no minimum FICO score. The GSEs and the private MBS sectors would not only emulate and expand upon FHA in these three regards, they would add their own loosened standards. For example, Fannie and Freddie would come to dominate the Alt-A- low doc/no doc market. The private MBS market would add ARMs¹⁵⁵ to the mix (the GSEs and FHA had the funding/pricing advantage on 30 years fixed rate, fixed payment loans).»¹⁵⁶

The result is that FHA begins to lose market share. In 1998-2000 its share varied between 10 and

¹⁵⁰ 1999 GAO rapport pp. 33-4/35-6.

¹⁵¹ The reaction of the Treasury is dated 25/10/99, and signed by Under Secretary (Domestic Finance) Gary Gensler.

¹⁵² GAO 1999 report p. 34/36.

¹⁵³ FHA's actuarial report 2009, quoted by Pinto on p. 99, in 2000-A.

¹⁵⁴ On p. 100, in 2000-B, Pinto quotes extensively from the press release.

¹⁵⁵ ARM= adjustable rate mortgage. Meaning a variable interest rate.

¹⁵⁶ Pinto 2000-B, pp. 100-1. Table 2 on p. 18 of the FCIC-staff report *GSEs and the financial crisis* gives an impression of the size of some categories of non-traditional mortgages (NTM). At Fanny, acquired “non-full doc” for example, grows from 2004 until (and including) 2007 from B\$ 101 to B\$ 199. In other words: it almost doubles in size.

15%, from 2000-2006 it falls from 15 to 2%.¹⁵⁷

«On 19 June 2000 during the summit in Santa Maria da Feira the ECOFIN Council confirmed that Greece had fulfilled the necessary conditions to adopt the single currency as of 1 January 2001. The Council based its decision on the Convergence Reports prepared by the ECB and the European Commission, the opinion of the European Parliament and a proposal from the European Commission.»¹⁵⁸

Like the quote, the following table is from the ECB annual report 2000. It shows that the decision cannot have been based on fulfillment of the Maastricht convergence criteria (given above, search for “Maastricht”) or the economic health of Greece. Note in particular the data about exports, unemployment and gross debt.¹⁵⁹

«In 2000, Fannie Mae met its "Trillion Dollar Commitment" to help finance over 10 million homes for families and communities most in need during the seven years from 1994 through 2000. On March 15, 2000, Fannie Mae announced its "American Dream CommitmentSM" - a pledge to invest \$2 trillion over the next ten years to help finance housing for 18 million home buyers and renters and join with housing partners to reverse decay in inner cities and older suburbs and expand the availability of livable, affordable rental housing. The new plan will focus on

¹⁵⁷ Pinto p. 101, 2000-B. The 9% mentioned earlier probably refers to a market share which is defined in a slightly different way. P. 101 concerns “market share of home purchase mortgages”.

¹⁵⁸ ECB Annual report 2000 p. 76. The table is from p. 77. The ECOFIN council is the EU council of ministers of economic affairs and finance.

¹⁵⁹ Note the table-space wasted on irrelevant quarterly data.

- (i) promoting mortgage consumer rights, including broader, more equal access to lowest-cost mortgage credit;
- (ii) fighting mortgage discrimination and leading the housing market in serving minority families, including a pledge to provide \$420 billion in financing for 3 million minority households;
- (iii) addressing the unique housing needs of women-headed households, young families, new immigrants, seniors, and urban and rural dwellers;
- (iv) strengthening inner city and older suburban areas through new capital investments and expanded Partnership Offices;
- (v) providing new technologies to mortgage lenders and consumers in order to lower the costs of mortgage financing; and
- (vi) increasing the supply of affordable rental housing.»¹⁶⁰

In 2000-2001 there was a financial crisis, the so called dot.com crisis. The crisis consisted in a deep fall of the values of especially ICT-shares: a “crash” of the stock exchanges, and the consequences of this.

«Some companies, such as Pets.com, failed completely. Others lost a large portion of their market capitalization but remained stable and profitable, e.g., Cisco, whose stock declined by 86%. Some later recovered and surpassed their dot-com-bubble peaks, e.g., Amazon.com, whose stock went from 107 to 7 dollars per share, but a decade later exceeded 200.»¹⁶¹

The fall ended a decade of growth of ICT companies and of their valuation. The nineties were the years of the rise of the internet. Part of the growth of the valuations was caused by real growth of internet and related ICT companies. For another part it was based on expected future growth. But since the internet was entirely new, there was no reliable basis for predictions of its future and that of the industry it had spawned or fertilized. It was nevertheless evident that the sector and its valuation could not grow indefinitely. But nobody knew how to predict its ultimate size, when the growth would slow or stop, and when the stock valuations would start to decline.

The Fed reacted to the crash by relatively strong cuts in the discount rate.¹⁶² From half 2003- half 2004 the rate was 1%. From then on it grew to 5% in 2006-2007. In the following two years of crisis it was lowered to almost 0%.

The summary of the “Issue Brief” of December 2000 of HUD is the following:

«The homeownership rate has been eclipsing record after record for the last several years. This resurgence follows declines in the eighties with stagnate and unchanging rates through the mid-nineties. Improved overall economic conditions with the record long recovery contributed heavily to this homeownership increase. But administration and HUD efforts have also contributed to the improved access to homeownership. These efforts include a revitalized FHA, more demanding goals for the GSEs, renewed emphasis on CRA and equal opportunity enforcement, and numerous other activities such as the Million Homes initiative. While this homeownership progress is widely shared across racial, ethnic and locational groups, gaps remain. Maintaining the overall progress and closing these racial and ethnic gaps are the work remaining.»¹⁶³

How the message and pressure is passed on is implicitly explained in a speech by Fannie’s Vice Chair, Jamie Gorelick, to an American Bankers Association conference on 30/10/00, a short time after HUD had published increased affordable housing goals for the GSEs:

¹⁶⁰ Fannie Mae information statement of March 30, 2001 p. 8. The statement can be found in the directory USA/Fannie under 20010330.

¹⁶¹ Wikipedia “Dot-com bubble”, 28/5/12.

¹⁶² For the meaning of “discount rate” and many other financial terms see the glossary on p. 107 and following of *The Federal Reserve System- Purposes & Functions* in the directory USA/Fed. The concept “discount rate” is described as: «Officially the primary credit rate, it is the interest rate at which an eligible depository institution may borrow funds, typically for a short period, directly from a Federal Reserve Bank. The law requires that the board of directors of each Reserve Bank establish the discount rate every fourteen days, subject to review and determination by the Board of Governors.»

¹⁶³ P. 7 of the Issue Brief. The Issue Brief can be found in the directory USA/HUD under 20001231.

«Your CRA business is very important to us. Since 1997, we have done nearly \$7 billion in specially targeted CRA business—all with depositories like yours. But that is just the beginning. Before the decade is over, Fannie Mae is committed to finance over \$20 billion in specially targeted CRA business and over \$500 billion in CRA business altogether...»

We want your CRA loans because they help us meet our housing goals... We will buy them from your portfolios, or package them into securities... We will also purchase CRA mortgages you make right at the point of origination... You can originate CRA loans for our purchase with one of our CRA-friendly products, like our 3 percent down Fannie 97. Or we have special community lending products with flexible underwriting and special financing... Our approach is “CRA your way”.»¹⁶⁴

In 2000 the Fed published the report of an inquiry into *The Performance and Profitability of CRA-Related Lending*. The report «confirmed an earlier 1996 study by the Federal Reserve Bank of Kansas City, which found that 76% of CRA loans were less profitable, substantially less profitable, or not profitable. This report also documented a litany of loan subsidies and loosened credit undertaken by banks in order to facilitate CRA lending.»¹⁶⁵

The NCRC reported in a misleading or incorrect way about the results of the Fed report:

«The survey found that the great majority of banks reported CRA loans made to low and moderate-income borrowers to be as profitable as their overall lending. In addition, the CRA loans did not exhibit higher foreclosure rates.”»¹⁶⁶

2001.

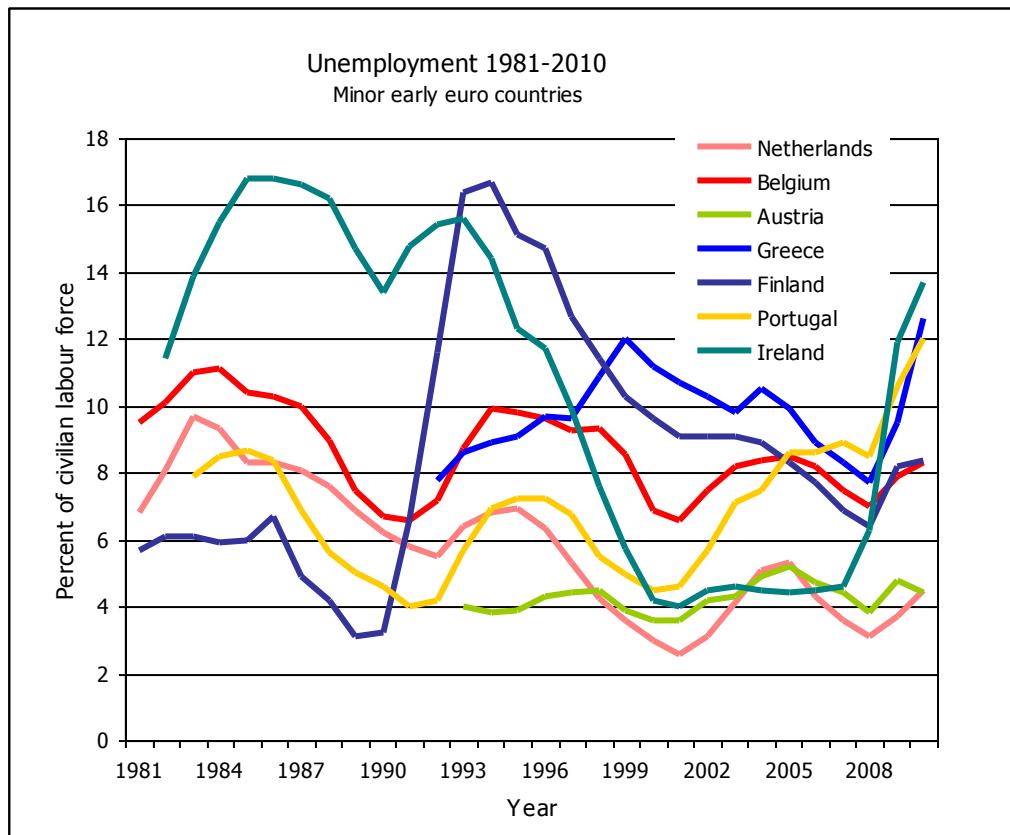

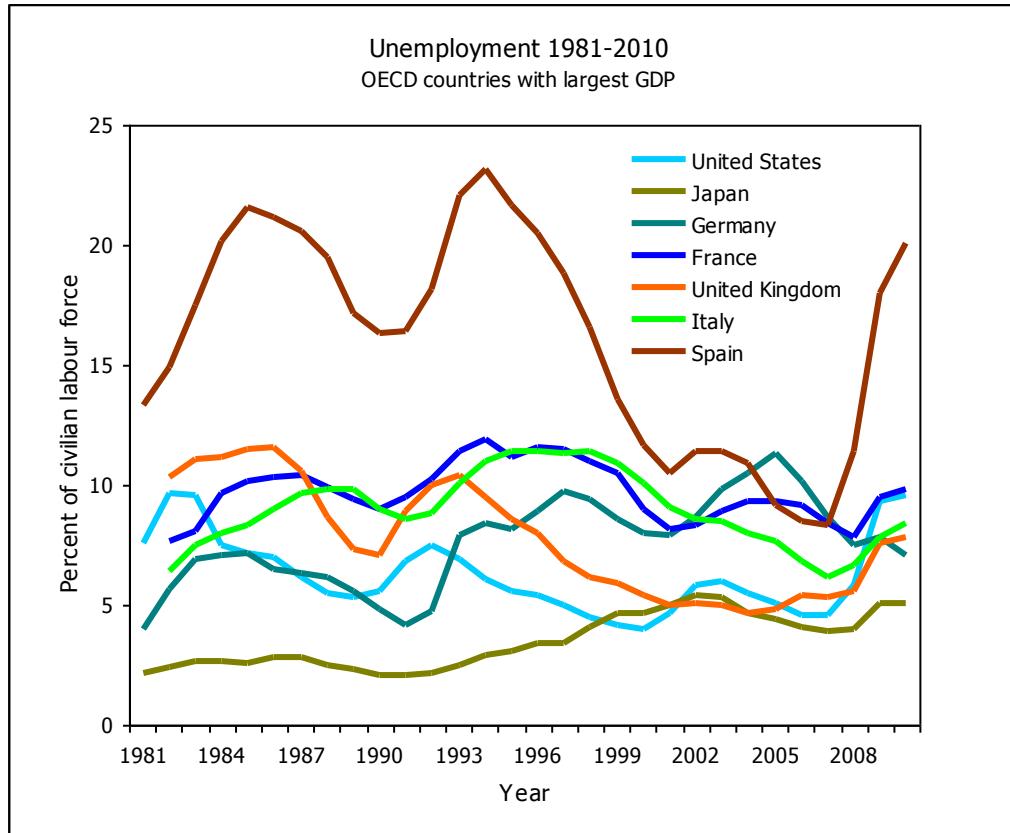

The repercussions of the dot.com crisis were aggravated by “9/11” (11/9/01) and the unparalleled fraud at Enron and Worldcom. Which made many innocent victims. The relative size of some of the consequences of these phenomena can be illustrated by graphs of long time series of unemployment data and the Standard and Poors 500 index. Graphs of the unemployment rate are given here;¹⁶⁷ the graph of the S&P 500 will be given at the end of 2008.

¹⁶⁴ FCIC Wallison report pp. 496-7/524-5.

¹⁶⁵ Pinto p. 102, in 2000-D.

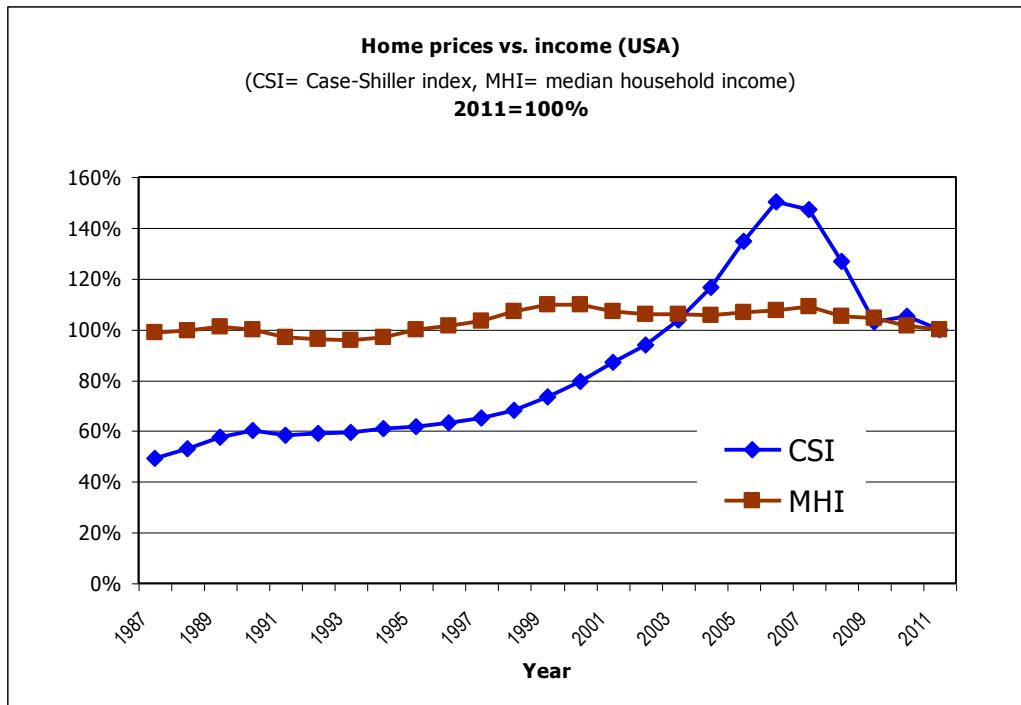

¹⁶⁶ Pinto p. 102, in 2000-D.

¹⁶⁷ The graphs were made using Annex table 22 of OECD *Economic Outlook* 2000-1 and Annex table 14 of OECD *Economic Outlook* 2012-1. The data for the overlapping years were “averaged” with linearly increasing weights.

For several reasons, such as direct or indirect governmental (HUD) pressure, profits, and market share, financial institutions tried to sell as many mortgages as possible. As from 2000 the home prices

increased (much) faster than incomes. See the following graph.¹⁶⁸ Homes became less affordable. It is moreover plausible that parts of the mortgage market became saturated, and that it was impossible to sell more mortgages under the “old” conditions. So these were (additional) reasons for mortgage originators to lower mortgage requirements (even more). They seemed not to bother about the greater risks. Perhaps because of the unfounded and unrealistic assumption that the interest rate would continue to decrease and incomes keep increasing. Or because they planned to pass the risk on by packaging the mortgages and selling them as MBS or as part of other securities.

Not everyone toaded to the government. On p. 498/526 of the FCIC report Wallison quotes an article “Housing in the New Millennium: A Home Without Equity is Just a Rental With Debt,” of Josh Rosner of June 2001:

«Over the past decade Fannie Mae and Freddie Mac have reduced required down payments on loans that they purchase in the secondary market. Those requirements have declined from 10% to 5% to 3% and in the past few months Fannie Mae announced that it would follow Freddie Mac’s recent move into the 0% down payment mortgage market. Although they are buying low down payment loans, those loans must be insured with ‘private mortgage insurance’ (PMI). On homes with PMI, even the closing costs can now be borrowed through unsecured loans, gifts or subsidies. This means that not only can the buyer put zero dollars down to purchase a new house but also that the mortgage can finance the closing costs....

[I]t appears a large portion of the housing sector’s growth in the 1990’s came from the easing of the credit underwriting process....The virtuous cycle of increasing homeownership due to greater leverage has the potential to become a vicious cycle of lower home prices due to an accelerating rate of foreclosures.».

¹⁶⁸ The income data are from Table H-8, Median Household Income by State: 1984 to 2011, U.S. Census Bureau, Current Population Survey, Annual Social and Economic Supplements. The Table includes income expressed in dollars of 2011.

The Standard & Poor's Case-Shiller Home Price Index (CSI) is a constant-quality house price index for the USA. The index reflects prices in real terms. They are corrected for inflation. The CSI in the graph is for the first quarter (Q1) of the given year. The data were taken on 4/6/13 from the Wikipedia page about the index. For more information about the CSI the reader is referred to this Wiki-page. It can be found in the directory Statistics.

On 30/3/01 Fannie Mae published an Information statement. For the year 2000 Fannie doesn't have an annual report or a 10K form. The Information statement seems to be meant as a substitute.¹⁶⁹ On p. 46 of the statement Fannie reports that it has been able to exceed the HUD goals for 1999 and 2000 by several percentage points. About the future it says:

«In October 2000, HUD issued a final rule with new housing goals that are effective in 2001 and represent significant increases over current goals. [...] The new goals represent a significant increase above Fannie Mae's historic level of performance, yet management has made a commitment to meet these goals in 2001.»

Freddie Mac does have an annual report for the year 2000.¹⁷⁰ On the pages 46-7/48-9 there is a section about housing goals. It says that Freddie has realized the HUD goals for 1999 and 2000. The section concludes:

«Management views the purchase of mortgages benefiting low- and moderate-income families and neighborhoods as an integral part of Freddie Mac's mission and business, and remains committed to fulfilling the needs of underserved borrowers and markets. Accordingly, Freddie Mac expects that it will continue to purchase the majority of the single-family and multifamily mortgages counted toward its performance under the housing goals through its standard purchase programs.»

Fannie and Freddy do not seem to expect problems with the higher goals.

In its explication of the increase of the goals, HUD said (in 2000):

«Because the GSEs have a funding advantage over other market participants, they have the ability to under price their competitors and increase their market share. This advantage, as has been the case in the prime market, could allow the GSEs to eventually play a significant role in the subprime market. As the GSEs become more comfortable with subprime lending, the line between what today is considered a subprime loan versus a prime loan will likely deteriorate, making expansion by the GSEs look more like an increase in the prime market. Since, as explained earlier in this chapter, one could define a prime loan as one that the GSEs will purchase, the difference between the prime and subprime markets will become less clear.»¹⁷¹

Pinto concludes: «HUD's regulatory regime drove a race to the bottom». ¹⁷² Or rather: the abyss.

2002.

«On 1 January 2002, the greatest cash changeover in history took place. It was a challenge of unprecedented dimensions that involved the banking sector, cash-in-transit companies, retailers, the cash-operated machine industry, and the general public. Around €144 billion in euro cash was provided early by the national central banks to banks (frontloading) and by these banks to retailers (sub-frontloading) to avoid bottlenecks in the supply chain. This meant that euro cash was widely available in all sectors in the first days of 2002. By 3 January 2002, 96% of all automated teller machines (ATMs) in the euro area were dispensing euro banknotes. And already one week after the introduction more than half of all cash transactions were being conducted in euro. [...] National banknotes and coins ceased to be legal tender by the end of February 2002 at the latest, [...].»¹⁷³

«In April, Fannie's Chairman Franklin Raines described the competitive landscape for public funding for housing:

“As a result of both congressionally mandated lending requirements and its own \$2 trillion American Dream Commitment, Fannie Mae has not-so-quietly become the largest single provider of mortgage funds to minority and low-income families, its chairman declared last week.”

“Not only is Fannie Mae 'by far' the largest supplier of mortgage money in the private sector,

¹⁶⁹ It can be found in the directory USA/Fannie, under 20010330.

¹⁷⁰ It can be found in the directory USA/Freddie.

¹⁷¹ Pinto p. 104, in 2000-E.

¹⁷² Pinto p. 106, in 2000-E.

¹⁷³ p. 8, *One currency for one Europe- the road to the euro*. EC 2014.

Franklin Raines proclaimed, the federally-chartered corporation is running 'neck and neck' with the Federal Housing Administration as the chief source of public funding for housing."

"The government is our only competitor," Mr. Raines said.

The absurdity of a government sponsored enterprise viewing the government as its competitor was lost on Mr. Raines. [According to Pinto] Congress intended this competition in passing the GSE Act of 1992.»¹⁷⁴

In the section *Regulation and Governmental Relationships* on p. 15/24 of its Annual report 2002 Freddie Mac says:

«We seek to purchase most single-family and multifamily mortgages in support of affordable housing through our standard mortgage purchase programs and under the same credit standards as our other mortgage purchases. We met each of the affordable housing goals in 2001 and 2002.»

The first assertion is confirmed on p. 110/119, in the section *Other regulatory matters*. Freddie does not seem to perceive the higher goals as a problem.

In the Annual report 2002 of Fanny Mae "housing goals" is missing. "Affordable housing" is mentioned, but Fannie makes no statement like that of Freddie just quoted, at least not in this annual report. Neither does the "proxy statement" of Fannie for 2002 provide useful information about this subject.¹⁷⁵

As of 2002 subprime ARMs outnumber fixed rate mortgages.¹⁷⁶

2003.

«That HUD's AH goals were the reason Fannie increased its high LTV (low downpayment) lending is clearly described in a Fannie presentation to HUD assistant secretary Albert Trevino on January 10, 2003: "Analyses of the market demonstrate the greatest barrier to home ownership for most renters are related to wealth—the lack of money for a downpayment... our low-downpayment lending—negligible until 1994—has grown considerably. It is a key part of our strategy to serve low-income and minority borrowers." The figure that accompanied that statement showed that Fannie's home purchase loans over 95 percent LTV had increased from one percent in 1994 to 7.9 percent in 2001.»¹⁷⁷

«Countrywide's CEO, Angelo Mozilo, gives the prestigious Dunlop Lecture sponsored by Harvard's Joint Center for Housing Policy. This annual address is made "by a housing leader to highlight the importance of housing as a policy and research area at the university and in business." Mozilo stated:

"One of the more obvious resolutions to the 'Money Gap' is the elimination of down-payment requirements for low-income and minority borrowers. Current downpayments of 10% or less add absolutely no value to the quality of the loan. It is the willingness [credit history] and the ability of the borrower to make monthly payments that are the determinants of loan quality."

"From my point of view, if 80% of the sub-prime borrowers are managing to make ends meet and make the mortgage payments on time, then, shouldn't we as a Nation, be justifiably proud that we are dramatically increasing homeownership opportunities for those who have been traditionally left behind."

The significance of Mozilo's 80% comment is that 20% of borrowers are not paying. A 20% default rate with a 50% severity (the percentage of the loss relative to the mortgage balance) results in a 10% loss rate. Losses of this magnitude require an annual default risk premium of 2.5%-3%. This default incidence is unsustainable at the family level – loosened underwriting sets up many home

¹⁷⁴ Pinto p. 118, in 2002-A.

¹⁷⁵ For the annual reports of Fannie and Freddie see the directories USA/Fannie and USA/Freddie respectively.

¹⁷⁶ Pinto p. 125, in 2003-E.

¹⁷⁷ FCIC Wallison report p. 493/521. "Loans over 95 percent LTV" probably means: "loans with an LTV of more than 95 percent".

owners for failure. It is unsustainable at the neighborhood level – as foreclosures spread they destroy neighborhoods.

In 2003 Countrywide was the nation's 8th largest subprime lender with a 6% market share. By 2006 it was #3 with a 6.8% share of a subprime market that was twice the size in 2003.»¹⁷⁸

Some states of the US did see the dangers (risks) of the reduction of mortgage requirements. They tried to prevent further reductions. However, their efforts were thwarted in 2003 and 2004 by the federal supervisors OCC and OTS. These asserted that (their) federal regulation pre-empted state lending laws. In other words: state and (other) local governments were shoved aside. «Once OCC and OTS pre-emption was in place, the two federal agencies were the only regulators with the power to prohibit abusive lending practices by national banks and thrifts and their direct subsidiaries.»¹⁷⁹

In the financial world, the Bank for International Settlements (BIS), domiciled at Basel, is one of the most important international financial institutions.¹⁸⁰ BIS is the home of the BCBS (mentioned under 1988) and of the Committee on the Global Financial System (CGFS). In January 2003 the CGFS published a report entitled *Credit Risk Transfer*.¹⁸¹ In the transfer of credit risk important roles are played by securitization and various derivatives. In other words: the subjects of the CGFS report are similar to those of the GAO 1994 report. Like the GAO 1994 report, the CGFS report shows large risks. It shows that since 1994 almost nothing has been done about the risks pointed out by the GAO. Regulation still lags far behind practical developments (to put it mildly). Like the GAO, CGFS fears harmful consequences of concentration:

«Concentration

As pointed out in Section IV.2, some parts of the CRT¹⁸² market are concentrated in a few institutions. In particular, intermediation of CDSs¹⁸³ is dominated by a handful of large universal banks and securities dealers; and risk taking on the most senior (“super senior”) unfunded tranches of CDOs is limited to the monolines and a few banks.

Although most intermediaries claim to have balanced books or only small structural positions, concentration in the intermediation of credit risk could itself be a problem. Even with a matched book- and achieving full matching may be difficult for a variety of reasons- institutions are still exposed to basis risks if contractual terms are not identical. It is, moreover, questionable whether a large number of contracts is effective in diversifying such risk.¹⁸⁴ Market risks can also be difficult to hedge in this area given patchy market liquidity. If intermediation remains highly concentrated, operational failings in dominant firms could disrupt markets. Any deterioration in the creditworthiness of large intermediaries- for example, as reflected in rating downgrades- could also reduce market liquidity by making counterparties less willing to trade without collateralization. It is hard to know whether the current concentration in intermediation reflects temporary first-mover effects or whether economies of scale imply that this degree of concentration will be maintained in the longer run. But it is worth recalling that consolidation and concentration seem to have become widespread features of financial markets.»¹⁸⁵

What happened in 2008 is one of the bad case scenarios suggested by this analysis. However, as in the years 1994-2003 (after the GAO 1994 report), nothing substantial was done about regulation or supervision. Not in the US, not anywhere else.

The quote is given to show that the risk and danger were well known, and that those responsible

¹⁷⁸ Pinto pp. 123-4, in 2003-D.

¹⁷⁹ Section 7.3 of the FCIC report, on pp. 111/139 and following. The quote is from p. 112.

¹⁸⁰ It was already known to the author in 1999 at the latest, at a time when he had only a minor interest in financial-economic matters.

¹⁸¹ The report, also called cgfs20, can be found in the directory BIS, under 20030129.

¹⁸² CRT= credit risk transfer.

¹⁸³ CDS= credit default swap, a security. For explanation see for example the FCIC staff study *Overview on derivatives*, pp. 17-8.

¹⁸⁴ A large number only reduces risk in the absence of correlation.

¹⁸⁵ This quote is from p. 27/31 of the CGFS report filed under 20030129.

have no excuse for ignorance and inaction.¹⁸⁶

Note that the quote implicitly shows an essential lack of information/ transparency, and that this lack makes the supervisors half blind or worse. CGFS understands that large risks exist, but due to lack of information it cannot see them clearly.

In the first days of February 2003, according to OFHEO head Falcon, Raines, head of Fannie, tried to prevent publication of the OFHEO systemic risk report mentioned below. Raines put pressure on Falcon, and tried to mobilize agencies and the Treasury department to do the same. Falcon did not budge. On the day of the release of the report, the White House announced Falcon's replacement. «The next day's news emphasized coverage of the personnel change and gave very scant coverage to the findings of the systemic risk report.»¹⁸⁷

On February 4, OFHEO published a report with the title *Systemic Risk: Fannie Mae, Freddie Mac And the Role of OFHEO*.¹⁸⁸ In this report, Fannie and Freddie are called “Enterprises”. The report studies three scenarios. They are defined as follows:

- «Scenario #1: In a Period of Reduced Liquidity, the Enterprises Help to Mitigate Systemic Risk.
- Scenario #2: One Enterprise Develops Serious Solvency Problems But Remains Liquid, There are Few Adverse Economic Effects, and No Systemic Event Occurs.
- Scenario #3: One Enterprise Suffers Large Losses and Becomes Illiquid and a Systemic Event Results.»¹⁸⁹

Footnote 360 on p. 100 of the report reads as follows:

«Those estimates were calculated from data from the Federal Deposit Insurance Corporation, and reflect OFHEO’s estimates that at year-end 2001 over 4,800 commercial banks—over sixty percent of the institutions in the banking industry—held GSE debt in excess of 50 percent of their equity capital. Nearly sixty percent of those banks have less than \$100 million in assets; over ninety-seven percent have assets of less than \$1 billion. Of banks with assets of more than \$1 billion, 123 institutions—over 30 percent of banks of that size—owned GSE debt in excess of 50 percent of their equity capital.»

So unless the GSEs have perfect risk management (not in the customary sense, but that of the present author, see the Analysis), they obviously cause significant systemic risk.

The following is excerpted from the section *Conclusions Implied by the Scenarios*:

«Scenario #3 illustrates how a severe deterioration in the solvency of Fannie Mae or Freddie Mac could heighten uncertainty about the viability of that Enterprise, the potential for credit losses to investors in their debt and MBS, and the liquidity of those securities. As a study of the financial sector written for the Department of the Treasury observed, “[t]he accumulation of uncertainty over time is a major, if not the major, element of systemic risk.” Scenario #3 also illustrates how heightened uncertainty about the liquidity of the debt of an undercapitalized Enterprise could lead to contagious illiquidity in the market for those securities. Such illiquidity could cause or worsen liquidity or solvency problems at other financial institutions and disrupt the housing markets and the financial system, potentially leading to a systemic event that could impose large economic losses.

Scenario #3 would not have been possible a decade or two ago, when the failure of Fannie Mae or Freddie Mac would have posed a much smaller systemic threat to the U.S. economy. If Fannie Mae had failed at year-end 1981, when the Enterprise was insolvent on a mark-to-market basis and had less than \$60 billion in outstanding debt and \$3 billion in guaranteed MBS, that failure would have imposed losses on investors, mortgage lenders, and related firms but probably would not have seriously threatened a collapse of the housing finance system or a disruption of financial markets

¹⁸⁶ The more so since they should have been able to reproduce the analyses of GAO and CGFS independently, without any help from GAO or CGFS. That is what it means to be competent.

¹⁸⁷ The next day was February 5, 2003. The source of this paragraph is the transcript of the FCIC hearing of 9/4/10. The relevant part is reproduced in the last section of the OFHEO appendix.

¹⁸⁸ OFHEO= Office of Federal Housing Enterprise Oversight. In 2008 it was replaced by the FHFA, the Federal Housing Finance Agency.

¹⁸⁹ Systemic risk report pp. 93/96 and following. Points added by the present author.

generally. At the time the Federal Housing Enterprises Safety and Soundness Enhancement Act of 1992 was enacted, the outstanding debt of Fannie Mae was about one-fifth, and that of Freddie Mac was about one-twentieth, of the levels at year-end 2001. In addition, the Enterprises' debt and MBS were much less important in financial markets, and Fannie Mae and Freddie Mac were just beginning to use financial derivatives. Although OFHEO regulation of the Enterprises has reduced the likelihood of an Enterprise failure, the potential for such a failure, if it occurred, to contribute to disruptions in the housing market and financial system is much greater now than it was then.»¹⁹⁰

The annual reports of 2003 and later years of the Dutch central bank DNB,¹⁹¹ the Dutch Fed, make no mention of the reports of the GAO or CGFS.¹⁹² But if you search these reports with relevant keywords you find interesting things. The Annual report 2003 shows that DNB did discern risks in the use of securitization and derivatives. On p. 93/87 it makes the following observation:

«The improvement of risk management of individual institutions goes together with increasing use of instruments like securitization and credit derivatives. These enable banks to transform risks, or to transfer them. In this way risks are spread better across the system, improving stability.¹⁹³ A drawback of these instruments is that they reduce the transparency of the system, and therefore the manageability in crisis situations.¹⁹⁴ For this reason many policy initiatives are aimed at improving transparency (see section 4.5.4).»

Section 4.5.4 shows that the last sentence may refer to (unpublished) DNB-policy. It does not however refer to initiatives of the government, or in the field of law and regulation:

«Supervisors furthermore emphatically paid attention to cross sectoral developments, such as the transfer of risks within and between (not always regulated) sectors. In particular the transfer of credit risk with instruments like credit derivatives and securitization takes a high flight. Matters of concern are that it is not clear where the credit risks end up ultimately, and whether the risk management of the institution accepting the risk is adapted to it.¹⁹⁵ Both in Basel and European context one therefore tries to get a better view of risk transfer activities, for example by interviews with banks. The first results will be published in the middle of 2004.»¹⁹⁶

“Attention” and interviews, but no action. This is what DNB means by “many policy initiatives”.

Of course it is very peculiar that DNB makes no mention of the CGFS report about this subject, which was after all published in 2003. Or of the earlier GAO reports (of 1994 and 1999). Shouldn’t a professional organization mention and use relevant work in its field? The reports of GAO and CGFS are clear and well-substantiated, and explicitly ask action of the responsible authorities. The text of the annual reports of DNB shows that DNB doesn’t really worry much. There is no sense of urgency. It is clear that even improvement of transparency will take years (at least).

DNB asserts that it needs more insight. But it does not explain what is missing or wrong in the reports of GAO and CGFS to invalidate their conclusions, and to ignore or reject their recommendations. The quotes suggest an unbusinesslike culture of talkers, lacking necessary depth and energy. Why doesn’t DNB translate its observations and worries in recommendations for the institutions whom it may concern? Why are there no more concrete plans for follow up activities? The law makes DNB guardian of financial stability.¹⁹⁷ Can a guardian suffice with observation?

¹⁹⁰ Systemic risk report p. 105/108.

¹⁹¹ DNB= De Nederlandsche Bank. For more information see the appendix DNB and the appendix devoted to its president from 1/7/97-30/6/11, Nout Wellink.

¹⁹² Neither did earlier DNB annual reports.

¹⁹³ Stability is only improved conditionally. For example if total risk remains the same. Not if more risks are taken because they end up in another institution. Spreading risks moreover also implies the possibility of widespread contamination. In any case it would have been more factual and objective, and less normative, if “spread better” had been replaced by “spread more widely”.

¹⁹⁴ Note that the prevention of crises is not mentioned.

¹⁹⁵ DNB does not explain how to manage the risk of inability to fulfill obligations of credit default swaps. In other words: how to take account of the fact that a CDS is not an insurance. Risks are not only spread but also created or amplified.

¹⁹⁶ DNB AR 2003 p. 96/90.

¹⁹⁷ Hence the text on the front cover of an informative brochure, in the directory DNB, under 20081231: “Guardian of financial stability”. The text almost fills the cover.

A search for “risicotran” and “deriva” in DNB’s Annual report 2004 gives no results. There is no report about the “first results” promised in the last quote. But in the Annual report 2005 a search for “deriva” yields interesting results. They are presented and discussed in the appendix DNB.

One of the most remarkable facts of the history of the financial crises is that

- authoritative and well-substantiated warnings have been given;
- the warnings were ignored by those who could and should act upon them;
- the warnings were denied after the fact by those responsible;
- the official inquiry commissions covered the denials, thereby falsifying history.

For example section 4.4, *Mistaken risk estimates*, of the first report of the Dutch parliamentary inquiry commission De Wit suggests that important facts only became known or understood after the precipitous events of September 2008.¹⁹⁸ The above shows that this is incorrect. “Errors” like these can be explained- to a certain extent- by erroneous methods of inquiry.¹⁹⁹ The CDW did not study contemporary documents. It gave a dominating role to interviews- held in 2010: “after the fact”- with people who had responsibilities in the events under investigation.

Section 4.4 of CDW1 opens as follows:

«Afterwards it turned out that it had not been known how the risks were distributed over the different products and actors. As a consequence not only the financial institutions underestimated risks, but the supervisors as well.»²⁰⁰

And a few pages farther on:

«When after the collapse of the credit markets it was realized that the risks had been much greater than thought, it also became clear how far securitization in combination with shadow banking had made the system opaque.»²⁰¹

The quotes from GAO reports show that it had been known for many years that the system was dangerously opaque, and that certain product types, distributions, and concentrations cause system risks which upon realization endanger the operation of the financial system as a coherent whole. This can be concluded without knowing “how the risks were distributed over the different products and actors”. The “As a consequence” of the second sentence in the first quote is logically incorrect. The annual report 2003 of DNB shows that at that time (at the latest) DNB was aware of risks. The recommendations of GAO and CGFS have nevertheless been ignored. By all central banks and finance ministers. Even though the central banks have the legal duty to maintain the stability of the financial system. And even though Wouter Bos in his interview with CDW claimed that as minister of finance he was responsible for the financial system.²⁰² None of these responsible institutions did anything to resolve the opaqueness and reduce the risks.

The main problem was not a lack of information, but the failure to use what was known. The problem was the incompetence and the lack of a sense of responsibility of those responsible. A quote from the hearing of president Wellink of DNB by the Dutch parliamentary inquiry of the (first) financial crisis demonstrates this attitude. Wellink starts by quoting Greenspan:

«As supervisors we are only interested in the tail risks; can you give us some more erudite knowledge about tail risks?» In my [= Wellink’s] opinion this was a great moment. The answer was: No, because it never happens.²⁰³ They went back to the US, and the following week a tail risk was realized, and LTCM failed. This is what I mean by risks we haven’t seen. We knew that the system

¹⁹⁸ The name of the commission is abbreviated CDW, that of its first report CDW1.

¹⁹⁹ Supposing they are errors, and not expressly intended to mislead and/or cover those responsible and/or avoid effective, far reaching, measures. As noted before, and as the GAO report of 1994 shows, any expert should have been able to reproduce the analysis of GAO, and drawn the same conclusions. In other words: the reasoning of CDW is false.

²⁰⁰ First report CDW p. 56/53. The report can be found in the directory CDW, under 20100510. The first sentence is of course true, but a typical political assertion: formally true, but misleading and a cover for deceit. The “As a consequence” in the second sentence on the other hand is untrue.

²⁰¹ First report CDW p. 60/56. There are many more incorrect or misleading assertions in this section.

²⁰² See the appendix Bos, or the Report of the hearings of the CDW.

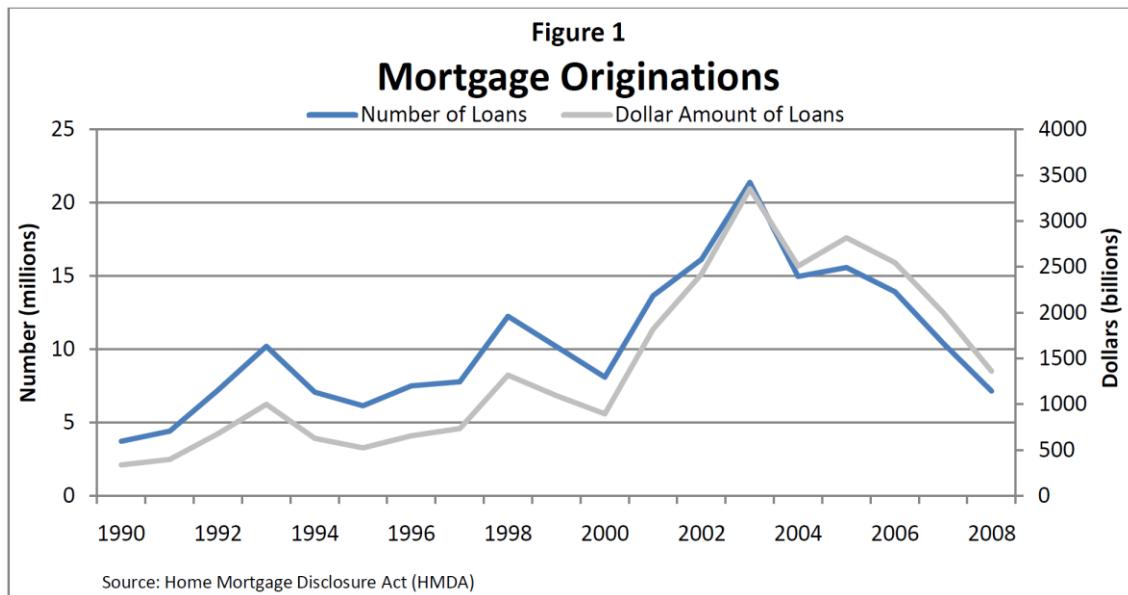

²⁰³ Is this quote correct? The answer could have been: No, because it never happened. Even this is not correct: one could for example extrapolate from known risks.

contained risks, but didn't know their size, we didn't know where the tail started, and didn't know what the tail looked like.»

But you will never know, and need not know. If you think you need to know everything you are not suitable for your function.²⁰⁴ What matters is to know the causal phenomena, and to arrange matters in such a way that innocent people and organizations will not be harmed. If Wellink and the rest of DNB had done their duty, they would have known more than enough. But they simply did nothing.²⁰⁵

Although the CGFS report was mentioned by W.R. White in his hearing by the CDW on 3/2/10, the inquiry commission has done nothing with either the CGFS report or those of the GAO.²⁰⁶

In 2003 the number of mortgages sold reached a maximum. This was partly due to refinancing of existing mortgages. Which in its turn was caused by the relatively low interest rate. The following graphs illustrate the developments. They are copied from pp. 4 and 5 of the FCIC staff study *The Mortgage Crisis*. They also show that the number of new mortgages reached a maximum in 2005.

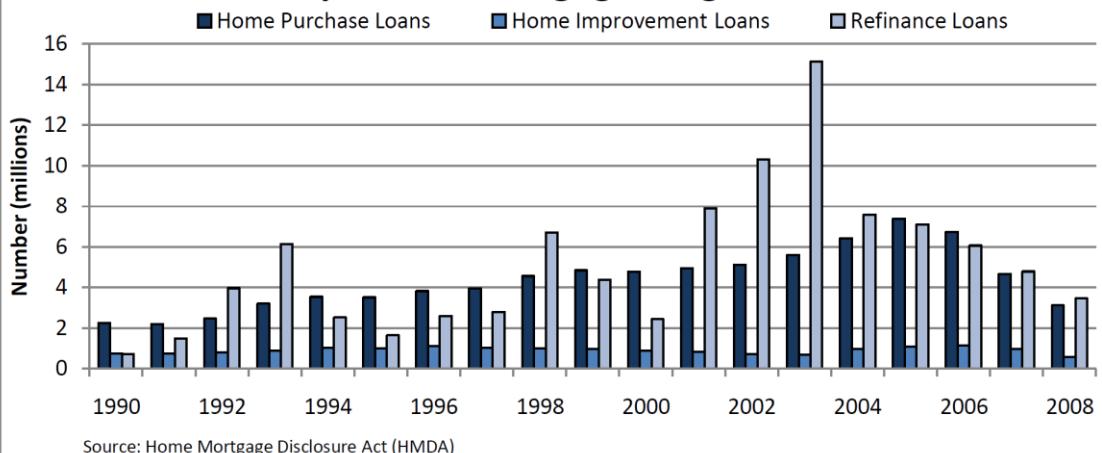

²⁰⁴ The inquiry commission and parliament should have noted this, and drawn the one and only possible conclusion: Wellink must go. By the way, why "only interested in tail risks"? Another reason for dismissal!

²⁰⁵ Actually this applies to all or almost all supervisors. In the first place the US Fed. More on this can be found in Part 2, Analysis.

²⁰⁶ The GAO-report is not mentioned. The GAO is referred to by Muis. He sketches some positive distinguishing characteristics of the Office. The report of the hearing of mr. White can be found in 20100510_Gespreksverslagen Cie De Wit_TK 31980.pdf, in the directory Commission De Wit.

Figure 2
Purpose of Mortgage Originations

As from 2003 the 10K forms of Fanny Mae unambiguously note that the affordable housing goals of HUD can only be realized by reduction of the mortgage requirements, and by taking larger risks. HUD did not react with downward adjustments of the goals, but with increases.

«In order to be able to meet these housing goals, the Charter Act permits Fannie Mae to undertake "activities . . . involving a reasonable economic return that may be less than the return earned on other activities." Accordingly, we may agree to less favorable economic terms or offer other incentives to obtain business that contributes toward meeting our housing goals. Because the housing goals are generally expressed as a percentage of the total number of dwelling units financed during the period, meeting the goals can be more challenging during a time of high refinancing volume, such as 2003 when interest rates remained at historically low levels, because a large portion of the refinance business does not materially contribute to our housing goals. We were able to meet HUD's goals during 2003, but in order to do so we entered into transactions that were meaningful to our own housing goals but had less favorable economic terms and provided other incentives. This practice is consistent with our Charter Act and may be necessary to meet our housing goals. These transactions in 2003 did not, in the aggregate, materially adversely affect our financial performance in 2003.»²⁰⁷

The Annual report 2003 of Freddie Mac points out that the increased affordable housing goals will cause greater risks and a smaller yield:

«On May 3, 2004, HUD published for public notice and comment a proposed rule that would establish higher affordable housing mortgage purchase goals for us and Fannie Mae for calendar years 2005 through 2008. The proposed rule would also establish new subgoals for purchase-money mortgages. On July 16, 2004, we filed comments with HUD on the proposed housing goals.

We believe that the adoption of the rule as proposed, or certain market conditions, could adversely affect our results of operations in future years. See also "BUSINESS- Mortgage Purchase and Guarantee Activity- Credit Guarantee" for more information regarding these factors. If a final rule were to be adopted substantially as proposed, we would take measures to reduce or eliminate material adverse business impacts; however, there could be no assurance that any such measures would be fully successful. At the conclusion of the rulemaking process, HUD may promulgate a final rule that differs from, or is the same as, the proposed rule based upon the comments that it receives, or HUD may withdraw the proposed rule entirely. Consequently, we are unable to predict with certainty the future impact of any final rule on our business operations, financial condition or results of operations.»²⁰⁸

This annual report does not notice that realization of the AH-goals necessitates lowering the mortgage requirements. At least not explicitly.

One may assume that Freddie's comments were in line with the opinions expressed in its annual

²⁰⁷ Form 10-K of Fannie Mae about 2003, p. 15. The form can be found in the directory USA/Fannie.

²⁰⁸ Freddie Mac AR 2003 p. 20/35. The pdf-file of this annual report was created on 21/9/04.

report. HUD ignored them. Though none of the documents in the dossier of this chapter shows any counterarguments.²⁰⁹

The following tables show the decline of the profitability of Fannie and Freddie in 2003-2007. The amounts are in B\$. For the notes please see the original publication.

«By the end of 2003, 58% of all outstanding single family mortgages were less than a year old and each had an appraisal justifying the loan amount based on the latest boom-driven market value.»²¹²

The annual report 2004 of the supervisor OFHEO of the GSEs includes a FREDDIE MAC 2003 SUPERVISORY REPORT OF CONDITION.²¹³ The section *Management* of this report begins as follows:

«OFHEO conducted a special examination of the events leading to the public announcement on June 9, 2003, of the termination, resignation, and retirement of the three principal executive officers of Freddie Mac. The special examination was ordered to supplement an ongoing OFHEO examination of the financial condition of the Enterprise and the decision of Freddie Mac to restate its financial reports for 2000, 2001, and 2002. OFHEO released a report on the special examination detailing a pattern of inappropriate conduct and improper management of earnings that led to the restatement and management restructuring by the company.

Freddie Mac agreed to implement corrective measures and pay a civil money penalty of \$125 million as part of a consent order with OFHEO. The order sets forth specific actions for the Enterprise to implement that relate to:

- The Board of Directors and Senior Management

- Risk Management Transactions
- Oversight and Reporting

The Board of Directors of Freddie Mac has elected a new chairman and hired a number of senior executives as its new management team.»²¹⁴

At Fannie a special examination is still under way. Its findings will be reported below, under 2005.

2004.

In January Fannie Mae announces the next stage of the T\$ 2 of its American Dream Commitment®:

«Fannie Mae Launches Major Initiative to Tackle America's Toughest Housing Problems; Pledges to Help Raise Minority Homeownership Rate to 55 Percent over Next Ten Years. [...]»

The pledge boosts the company's commitment to President George W. Bush's Minority Home-ownership Initiative and will help raise the minority homeownership rate from 49 percent currently to 55 percent, with the ultimate goal of closing the gaps between minority homeownership rates and non-minority homeownership rates entirely.

Fannie Mae's new commitment to first-time home buyers is part of the next stage of the company's "American Dream Commitment," a plan announced in [the year] 2000 to provide \$2 trillion in private capital for 18 million minority and underserved Americans to own or rent a home by the end of the decade. Having met the \$2 trillion goal and the company's previous Trillion Dollar Commitment launched in 1994, Fannie Mae, along with many others [...] has now provided over \$3 trillion in funds for over 28 million underserved families in 10 years.»²¹⁵

On February 10 the GAO publishes a report *GOVERNMENT SPONSORED ENTERPRISES- A Framework for Strengthening GSE Governance and Oversight*. The following is the second of the two paragraphs of the section *What are the Risks of the GSEs?*

«The GSEs also pose potential risks to the stability of the U.S. financial system. In particular, if Fannie Mae, Freddie Mac, or the FHLBank System were unable to meet their financial obligations, other financial market participants depending on payments from these GSEs, may in turn become unable to meet their financial obligations. This risk, called systemic risk, is often associated with the housing GSEs because of the sheer size of their financial obligations. For example, as discussed in OFHEO's 2003 report on systemic risk, if either Fannie Mae or Freddie Mac were to become insolvent, financial institutions holding the enterprise's MBS could be put into a situation where they could no longer rely on those securities as a ready source of liquidity. Depending on the response of the federal government, the financial health of the banking segment of the financial services industry could decline rapidly, possibly leading to a decline in economic activity. As another example, derivatives counterparties holding contracts with a financially troubled GSE could realize large losses if the GSE were no longer able to meet its obligations. If such a hypothetical event were to occur, widespread defaults could occur in derivatives markets.»²¹⁶

²¹⁴ OFHEO AR 2004 pp. 43-4/49-50.

²¹⁵ Pinto 20100814 p. 137. Pinto doesn't mention a source. The style suggests a press release. The correctness is confirmed by a statement on p. 1 of Fannie's Form 10-K for 2003: «Fannie Mae expands equal housing access and opportunity in America by helping our lender customers reach the nation's underserved families and communities. In 1994, we launched our Trillion Dollar Commitment to provide \$1 trillion in home financing for 10 million families traditionally underserved by mainstream mortgage finance. After achieving that goal ahead of plan, in 2000 Fannie Mae announced a new, redoubled affordable housing plan, our \$2 trillion American Dream Commitment®, to serve 18 million underserved families by 2010. Having met that goal, Fannie Mae announced in January 2004 the next stage of the American Dream Commitment.»

²¹⁶ GOVERNMENT SPONSORED ENTERPRISES- A Framework for Strengthening GSE Governance and Oversight, GAO 2004, p. 6.

In June Basel II was published. Basel II is the agreement of the BCBS about a revised framework for capital measurement and capital standards; “revised” with respect to Basel I. The US Financial Crisis Inquiry Commission (FCIC) says the following about the motives for Basel II, and about its significance:

«Banks had complained for years that the original 1988 Basel standards did not allow them sufficient latitude to base their capital on the riskiness of particular assets. After years of negotiations, international regulators, with strong support from the Fed, introduced the Basel II capital regime in June 2004, which would allow banks to lower their capital charges if they could show they had sophisticated internal models for estimating the riskiness of their assets. While no U.S. bank fully implemented the more sophisticated approaches that it allowed, Basel II reflected and reinforced the supervisors’ risk-focused approach. Spillenkothen [the Fed’s director of Banking Supervision and Regulation from 2002 to 2006] said that one of the regulators’ biggest mistakes was their “acceptance of Basel II premises,” which he described as displaying “an excessive faith in internal bank risk models, an infatuation with the specious accuracy of complex quantitative risk measurement techniques, and a willingness (at least in the early days of Basel II) to tolerate a reduction in regulatory capital in return for the prospect of better risk management and greater risk-sensitivity.”»²¹⁷

The Wikipedia page about Basel II asserts that the positive effect of Basel II is controversial. An OECD study from 2011 suggest that the principal effect of agreements like Basel II is that financial institutions start looking for gaps and alternatives (that is: ways of escape).²¹⁸ The facts clearly show that Basel II was insufficient.

«By 2004, Fannie and Freddie were sufficiently in need of subprime loans to meet the AH goals that their CEOs, as the following account shows, went to a meeting of mortgage bankers to ask for more subprime loan production:

The top executives of Freddie Mac and Fannie Mae [Richard Syron and Franklin Raines] made no bones about their interest in buying loans made to borrowers formerly considered the province of nonprime and other niche lenders. ...Fannie Mae Chairman and [CEO] Franklin Raines told mortgage bankers in San Francisco that his company’s lender-customers ‘need to learn the best from the subprime market and bring the best from the prime market into [the subprime market].’ He offered praise for nonprime lenders that, he said, ‘are some of the best marketers in financial services.’ ... ‘We have to push products and opportunities to people who have lesser credit quality,’ he said.»²¹⁹

The following quote from an internal mail of Freddie Mac of 6/10/04 clearly shows the volume and significance of Alt-A MBS:

«The Alt-A business makes a contribution to our HUD goals. This year [2004] the Alt-A bulk [whole loan] transactions contribute 2 basis points towards achieving our Low/Mod goals, 5 basis points to our Special/ Affordable goals, and 40 basis points to our underserved GSE goals. During 2003, the Alt-A bulk business contributed 10 basis points to our Low/Mod and Special/Affordable goals. However, the NINA [no income/no assets] business by themselves have a negative impact to goals due to the fact that borrower income is not disclosed.»²²⁰

«Acting under authority of the 1992 Act, HUD issued an affordable housing goal regulation in 2004 that for the first time added subgoals and required that a fraction of each goal be met with home-purchase mortgages, as distinguished from refinancings. The 1992 Act calls on HUD to consider a number of factors in setting the goals, including "the need to maintain the sound financial condition of

²¹⁷ FCIC report p. 171/99.

²¹⁹ FCIC Wallison report p. 499/527 quotes from Neil Morse, “Looking for New Customers,” *Mortgage Banking*, December 1, 2004. The rectangular brackets are from the original.

²²⁰ Pinto p. 120, 2002-A. The rectangular brackets are copied from Pinto. As his source Pinto mentions: internal Freddie Mac email from Mike May to [CEO, JvV] Dick Syron, dated October 6, 2004 FMAC0013695 (contained in materials disclosed to the House Oversight and Government Reform Committee). See pp. 18 and 19 of *GSEs and the financial crisis* for numbers for 2004-2008, and a picture of the proportions.

the enterprises."»²²¹

On 1/11/04 HUD issues a press release about higher housing goals for the GSEs for the coming years:

«These new affordable housing goals will help the GSEs achieve the standard that Congress intended- leading the mortgage finance industry in helping low- and moderate income families afford decent housing," said HUD Secretary Alphonso Jackson. "These new goals will push the GSEs to genuinely lead the market.»²²²

In the document with the "Final Rule" one reads:

«Millions of Americans with less than perfect credit or who cannot meet some of the tougher underwriting requirements of the prime market for reasons such as inadequate income documentation, limited downpayment or cash reserves, or the desire to take more cash out in a refinancing than conventional loans allow, rely on subprime lenders for access to mortgage financing. If the GSEs reach deeper into the subprime market, more borrowers will benefit from the advantages that greater stability and standardization create.»²²³

The leadership-terminology is not incidental:

«While the GSEs can choose any strategy for leading the market, this leadership role can likely be accomplished by building on the many initiatives and programs that the enterprises have already started, including [follow 6 methods]»²²⁴

In 2004 Freddie Mac concluded, apparently in agreement with HUD,²²⁵ that the new goals could only be realized if the mortgage requirements were lowered:

«We are making significant efforts to meet the new goals and subgoals through adjustments to our mortgage sourcing and purchase strategies, including changes to our underwriting guidelines and expanded and targeted initiatives to reach underserved populations. Our strategies to meet the new goals and subgoals may result in the purchase of loans that offer lower expected returns on our investment and are likely to increase our exposure to potential credit losses. Increasing the concentration of our purchases of goal-eligible loans also may require us to forego other purchase opportunities that we would expect to be more profitable. If our current efforts to meet the new goals and subgoals prove to be insufficient, we may need to take additional steps that could lead to a significant reduction of service to portions of the conventional conforming mortgage market, and also a reduction in our profitability.»²²⁶

«Total CRA commitment volume for the year 2004 was \$1.631 trillion.»²²⁷

2005.

In March the report of The Joint Forum [on] Credit Risk Transfer of BCBS is published. It was written by a working group consisting of representatives of supervisors. Such as the Fed, NYFed, SEC, OCC, FDIC²²⁸ and DNB. The 17 recommendations, some consisting of two parts, can be

²²¹ FCIC staff study *GSEs and the financial crisis* p. 6.

²²² Pinto 2004-B op pp. 128-9.

²²³ Pinto 2004-B op pp. 128-9.

²²⁴ HUD's Final Rule, quoted on p. 133 of Pinto, in 2004-B. The leadership terminology is noteworthy because the FCIC asserted in 2011 that Wall Street was leading, and not the GSEs. No wonder that FCIC didn't prove its assertion.

²²⁵ This may be assumed because Freddie had communicated its problem to HUD through its comment on the HUD proposals for higher AH-goals, and the fact that HUD didn't adjust its proposals. Because of the text of the annual reports of Freddie en various HUD-quotes in the reports of Wallison and Pinto it is not plausible that HUD reacted to Freddie's comment with an alternative for lower mortgage requirements. On the contrary: the quotes suggest that lowering of mortgage requirements was precisely what HUD wanted.

²²⁶ Freddie Mac Annual report 2004 p. 11/23. (The pdf-file of the report is dated 13/6/05).

²²⁷ NCRC AR 2007, quoted by Pinto on p. 91, in 1998-B. For a table with CRA-commitments per institution until (& including) 1998 and as from 1999 see Pinto pp. 98-9.

²²⁸ FDIC= federal deposit insurance corporation.

interpreted as just as many risks and warnings. The first 13 are addressed to market participants, the last 4 to supervisors:

«Recommendation 14: Aggregate information

The efforts of the Committee on the Global Financial System to develop mechanisms that better identify aggregate information on credit risk should be strongly supported by supervisory authorities and market participants.

Recommendation 15: Supervisory Efforts

Supervisory authorities should undertake the steps necessary to enhance their understanding of evolving market developments in relation to CRT transactions. This includes the need to attract and retain qualified staff and to implement procedures, such as training programs, to improve staff knowledge and understanding on an ongoing basis. Supervisors would benefit from periodic discussions with market participants regarding developments in this area.

Recommendation 16: Supervisory and Regulatory Review

Supervisory authorities should periodically review regulations, supervisory guidance and reporting mechanisms that are pertinent to CRT transactions. In many cases, supervisory guidance and regulations applicable to OTC derivatives are not tailored specifically to credit derivatives transactions. While in many cases this is appropriate, there may be circumstances where the regulations, supervisory guidance or reporting mechanisms need to be adapted to some extent to better fulfill their specific objectives. Supervisors should undertake efforts to understand thoroughly the accounting treatment of CRT transactions and their implications, while also seeking to provide knowledgeable input into the development of appropriate accounting standards for CRT transactions.

Recommendation 17: Supervisory Information Sharing

Supervisory authorities should continue efforts to share information on CRT activities with the objectives of strengthening their mutual understanding of developments, promoting further improvements in risk management practices by market participants, and enhancing supervisory and regulatory approaches. In particular, supervisory authorities should share information on the regulatory approaches adopted in such areas as minimum capital and securitization to better understand the potential interactions between the different approaches and the incentives that these interactions could create for market participants.»²²⁹

In a report *Recent House Price Trends and Homeownership Affordability* of May 2005 HUD remarks:

«More liberal mortgage financing has contributed to the increase in demand for housing. During the 1990s, lenders have been encouraged by HUD and banking regulators to increase lending to low-income and minority households.²³⁰ The Community Reinvestment Act (CRA), Home Mortgage Disclosure Act (HMDA), government-sponsored enterprises (GSE) housing goals and fair lending laws have strongly encouraged mortgage brokers and lenders to market to low-income and minority borrowers. Sometimes these borrowers are higher risk, with blemished credit histories and high debt or simply little savings for a down payment.»²³¹

About the role of appraisals Pinto notes the following:

«To the extent appraisals have been considered at all, their contribution to the financial crisis has focused on fraud. The facts are much more nuanced and significant, with the major shortcoming being that the U.S. appraisal process was simply not up to the challenges of a housing boom fed by ever increasing leverage. The Collateral Risk Network, representing many of the largest financial institutions in the United States, pointed out in a white paper entitled “Reengineering the Appraisal Process”:

²²⁹ Basel Committee on Banking Supervision, Joint Forum Credit Risk Transfer, March 2005, pp. 9-10/15-6.

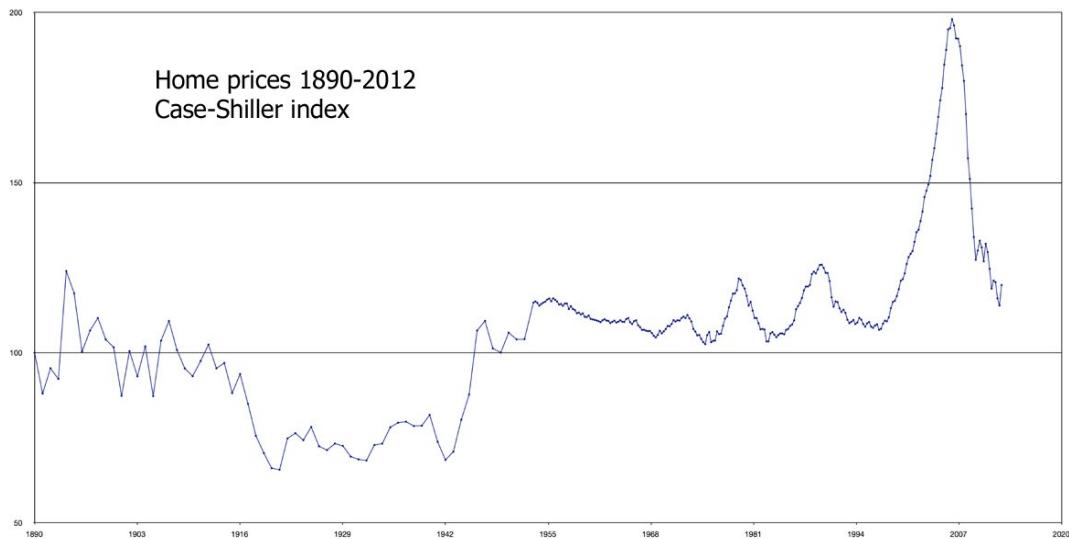

²³⁰ Note the “and bank regulators”, meaning supervisors.

²³¹ Pinto p. 156. Note the euphemism “More liberal mortgage financing”.

"[Appraisers] did help create fictitious equity and were complicit in facilitating trillions of dollars of loans that never should have been made. There are varying degrees of valuation inflation performed by appraisers. On the lighter side, there was just the grey area where appraisers hit the highest possible value as opposed to the most probable value. On the dark side, there was blatant fraud. And then, somewhere in the mix, was the failure to recognize an overheated market and report trends and risk to their clients... If we had credibly valued the underlying collateral, I would submit that there would be an active MBS market."»²³²

In Appendix D Pinto presents «a detailed description on how appraisal methods developed over the last 20 years by Fannie, Freddie, and regulators became less rigorous and resulted in property appraisers failing to recognize an overheated market and report trends and risks to their clients.»

On p. 149 Pinto gives a list of 25 «pro-cyclical/pro-leverage elements that helped drive the boom in home prices and housing finance».

«[...] some academics offered pointed analyses as they raised alarms. For example, in August 2005, the Yale professor Robert Shiller, who along with Karl Case developed the Case-Shiller Index, charted home prices to illustrate how precipitously they had climbed and how distorted the market appeared in historical terms. Shiller warned that the housing bubble would likely burst.»²³³

In continuation of the Special Examination of Freddie mentioned earlier, OFHEO in 2005 conducted a similar inquiry of Fannie. It published a separate report about the results.²³⁴ The “Letter of transmittal” to Congress in the Annual report 2006 (about 2005) gives the following summary:

«Although the Special Examination Report was not published until May 23, 2006, much of the work was done in 2005. The report concludes that Fannie Mae senior management presented an image of the Enterprise as one of the lowest-risk financial institutions in the world and as “best-in-class” in terms of risk management, financial reporting internal controls and corporate governance. The reality was that the image presented was false. The risks at Fannie Mae were greatly understated and senior management manipulated accounting and earnings. Fannie Mae also signed settlement agreements on May 23, 2006 with OFHEO and the SEC that include a \$400 million fine, growth limits and top-to-bottom remedial actions to enhance the safe and sound operation of the Enterprise going forward.

The annual examinations of both Enterprises state that progress was made in 2005, but that further work and several years are needed to fully achieve safe and sound practices. Although the Enterprises

²³² Pinto p. 148. The internal quote is from Joan N. Trice, Collateral Risk Network, “Reengineering the Appraisal Process”, 2009. Pinto mentions the website.

²³³ FCIC report p. 17/45. The years mentioned below the figure are: 1890, 1903,... 2007, 2020. In other words: the interval between the numbers given is 13 years. For more information about the Case-Shiller index see the Wiki-page with the same name in the directory Statistics.

²³⁴ Which the author could not find on the internet.

have differences, the key areas that need significant remedial attention are similar: accounting systems, internal controls, risk management, human resources, corporate governance and growth.

Due to the findings of operational inadequacies at both Fannie Mae and Freddie Mac, OFHEO required each Enterprise to hold 30 percent more capital than its minimum requirement. Capital levels are monitored weekly at both Enterprises by OFHEO's examination teams.»

2006.

«In January 2006, trading commenced in ABX.HE, an index of CDS on asset-backed securities collateralized by subprime home equity loans. The index comprises five sub-indexes created by pooling like-rated tranches with ratings of AAA, AA, A, BBB, and BBB-. Sixteen dealers participate in the CDSIndexCo consortium and vote every six months on the 20 single-names that are aggregated into each vintage of the index. These dealers also supply daily pricing to Markit, the administrator for this and other credit indices. The index notional amount adjusts as any of the reference entities amortize, prepay, default or incur write-downs or write-ups. [...]»

The ABX was an important innovation for investors who wanted a direct, relatively liquid way to take a short position in mortgage credit. Prior to the launch of the ABX in early 2006, investors who wanted to go short had to find dealers willing to sell them protection via ABCDS²³⁵, an illiquid market at that time.»²³⁶

Due to decreasing interest rates and increasing demand, international²³⁷ home prices had been increasing monotonously for about ten years.²³⁸ In 2006-2008 this development came to an end. The US led the way. US home prices reached a maximum in April 2006.²³⁹ Around this time, the interest rates on mortgages had increased from 6 to 7 %, or fluctuated between these values.²⁴⁰

²³⁵ ABCDS = asset backed credit default swap, a security. See p. 10 of the FCIC-staff study *Credit derivatives and mortgage-related credit derivatives*.

²³⁶ P. 13 of the FCIC-staff study *Credit derivatives and mortgage-related credit derivatives*. For some more explanation and graphs see below, at the transition 2006-2007.

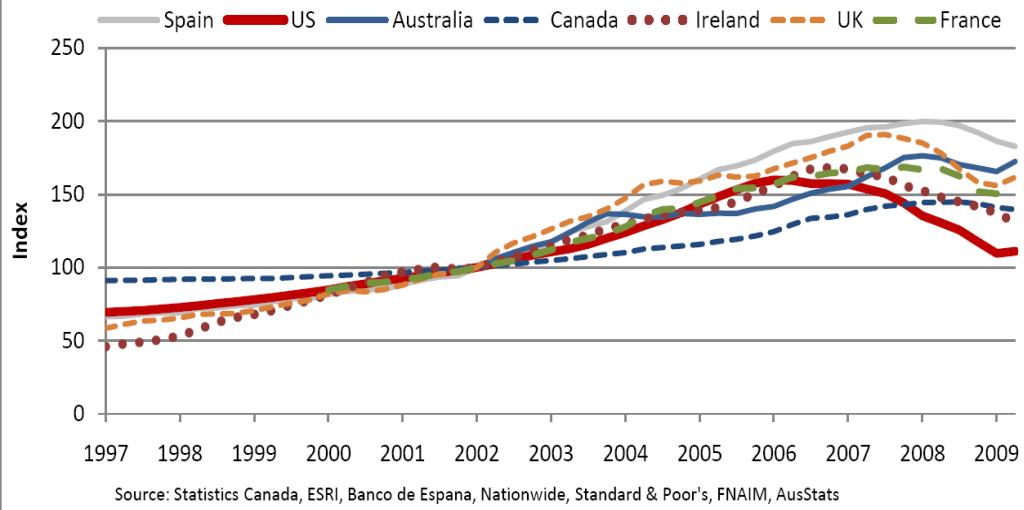

²³⁷ Figure 9 on p. 17 of the FCIC-staff study *The Mortgage crisis*. For time series starting with 1991 see FCIC document *Selected financial market & economic data* p. 8. The years 1991-1997 show a very small increase of the prices. In other words: the annual increase increases increased monotonously from 1991-2005.

²³⁸ Monotonous increase= increasing without (significant) interruption. In different time periods the increase may differ and even be zero, but it is never significantly less than zero. Similarly “monotonous decrease”.

²³⁹ FCIC report p. 87/115 and staff study *The Mortgage Crisis* p.18. For the OECD countries see table 59 on p. 293 of the statistical annex of the *Economic Outlook 2012-1* (and the corresponding table in other editions of the half yearly *Economic Outlook*).

²⁴⁰ This may be relevant information, but is mainly noted for completeness. The significance of the details of the development of the interest rate may be limited. It is clear that they cannot explain the increasing delinquency to be mentioned below.

Figure 9
International Home Prices

As long as the mortgage rate decreased and home prices increased, the consequences of inability to pay interest and amortization were relatively small. If necessary, the debt could be paid by sale of the home. If home prices decrease, sale may saddle the homeowner with a net debt.

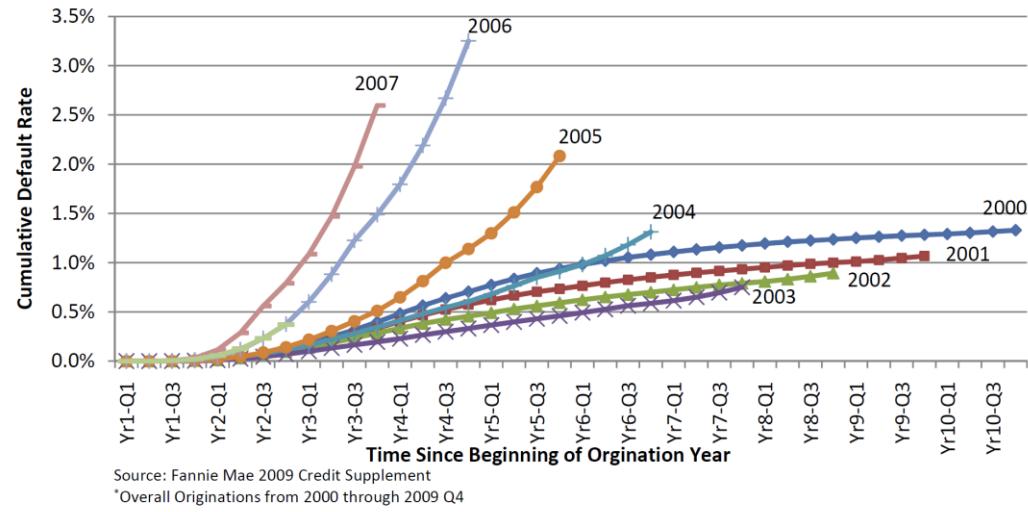

The consequences of changes in interest and/or home prices depend on the ability to bear the risks taken. In the US the risks had been underestimated relatively strongly. Especially in the years 2004-2007.

Figure 12 on p. 17 of the FCIC staff study *GSEs and the financial crisis* shows the cumulative default rate for Fannie Mae.²⁴¹ The figure is copied below. For every year of mortgage originations a line has been drawn. Figure 11.2 on p. 217/245 of the FCIC report additionally shows the difference in performance of prime, Alt A and subprime mortgages. For this graph the reader is referred to the appendix Graphs.

The figure below shows that the quality of the mortgages sold in 2000-2003 improved slowly, to drop fast from 2004 to 2007. The quality was best in 2003. In 2004 it was already worse than in each of the years since 2000. In 2008 it was back at the level of 2006.

²⁴¹ A similar graph for Freddie can be found on p. 12 of the paper *The Role of the GSEs and Housing Policy in the Financial Crisis* by D.M. Jaffee for the FCIC. The file can be found in the directory FCIC/Studies under 20100225. A similar graph can be found in CDW1: figure 3.4 on p. 46/42. This graph also shows the difference in performance of prime, Alt A and subprime.

Figure 12
Fannie Mae Single-Family Cumulative Default Rate*

In 2006 the number of people that couldn't pay the costs of their mortgage in time started to increase rather dramatically. As a consequence, the supply of houses increased, and home prices decreased further. Hampering solution of mortgage problems.²⁴² Another consequence was the devaluation of MBS.

The documentation does not show exactly when people began to think that this was not a temporary fluctuation, but a turning point, and the beginning of a slide or avalanche. Graphs like those shown here were made years after the events, and not available at the time.

It is no more than logical that it took time to see that an era had ended. Initially, what people saw could turn out to be temporary. Fluctuations, ups and downs, are normal. After a relatively short time, the old, well known trend could have been resumed. It takes time to show that times have changed for a longer time. It was clear that home prices couldn't rise indefinitely. But it was completely unclear when prices would start to fall.²⁴³

What can be observed is that at the end of 2006 and the beginning of 2007 more and more financial institutions became aware of the fact that risks are more than figments of the mind. They can be realized. The institutions became more careful with securities which depended directly or indirectly on mortgages. As a consequence the value of these securities decreased. Fearing further loss of value, more pessimistic institutions started to try and get rid of especially subprime securities, or to "insure" themselves with CDS.²⁴⁴ In efforts to sell "poisoned" securities,²⁴⁵ use was sometimes made of lack of know how on the side of the prospective buyer.²⁴⁶

According to the FCIC: «High leverage, inadequate capital, and short-term funding made many financial institutions extraordinarily vulnerable to the downturn in the market in 2007.»²⁴⁷

HUD continued its affordable housing policy as if business was as usual. And as if the implicit

²⁴² The system was and is not stable but unstable. A relatively small disturbance at least of certain types is not corrected but amplified. This is logical, and should have been known to regulators and supervisors (because of their legal duties, and because of their pretensions).

²⁴³ As far as known to the author. Perhaps the decline in sales of mortgages caused the stagnation of the price development. And the decline in sales may have been caused by the incomes in combination with interest developments. As noted earlier, market saturation may also have played a role. And it is evident that the HUD goals could not rise indefinitely either without causing something to break or burst.

²⁴⁴ FCIC report p. 234/262.

²⁴⁵ That is: securities including subprime mortgages or dependent products.

²⁴⁶ See sections 12.1 (pp. 235/263 and following) and 13.1 (pp. 246/274 a.f.) of the FCIC-report.

²⁴⁷ FCIC report p. 230/258.

warnings of the GSEs could be ignored. This while the market developments at least suggested that the remarks and warnings of the GSEs were justified. To give an example of these remarks and warnings I give two quotes from the Annual report 2006 of Freddie Mac.²⁴⁸ The first is from p. 6²⁴⁹, from the beginning of the section *Serving Our Mission* in the “Message from the Chairman” and CEO Richard F. Styron:

«As a government-sponsored enterprise (GSE), Freddie Mac faced mounting mission challenges in 2006: reduced affordability, rising concerns about credit quality and predatory lending, a housing sector losing momentum, and HUD affordable housing goals of unprecedented difficulty. Despite these challenges, we served our mission well- providing liquidity, affordability and stability to the housing finance market, and to a broader economy hoping to see a “soft landing” for housing.

I am proud that Freddie Mac’s affordable performance in 2006 was among our strongest ever. We believe we met the most demanding affordable housing goals in the company’s history, pending determination by the U.S. Department of Housing and Urban Development. Of the nearly 3.3 million homes we financed last year, almost 56 percent were affordable to low- or moderate-income families. We served 300,000 first-time homebuyers. And in another record year for our growing multifamily business, we financed almost half a million affordable apartment homes.

We also believe we achieved two of our three subgoals, although we reported to HUD that we just missed one of the extremely challenging subgoals by less than 700 loans out of more than 900,000 eligible mortgage purchases. The difficulty of this challenge was magnified by market forces affecting the entire housing sector that made the average home less affordable in 2006. It also highlighted the GSEs’ need to strike a balance between striving to achieve demanding housing goals and ensuring that we do not encourage imprudent lending.»

The second is from p. 13/25, from the section **Legal and regulatory risks**:

«We are making certain changes to our business to meet HUD’s housing goals and subgoals, which may adversely affect our profitability.

We are making significant adjustments to our mortgage sourcing and purchase strategies in an effort to meet our housing goals and subgoals, including changes to our underwriting guidelines and the expanded use of targeted initiatives to reach underserved populations. For example, we are purchasing loans and mortgage-related securities that offer lower expected returns on our investment and increase our exposure to credit losses. In addition, in order to meet future housing goals and subgoals, our purchases of goal-eligible loans need to increase as a percentage of total new mortgage purchases, which is causing us to forego other purchase opportunities that we would expect to be more profitable. If our current efforts to meet the goals and subgoals prove to be insufficient, we may need to take additional steps that could lead to a further reduction of service to portions of the conventional conforming mortgage market, and also a reduction in our profitability. In fact, for 2006, we reported to HUD that we did not meet one of the three home purchase subgoals.»

Every year OFHEO sent a report to Congress, mostly in June. The “Report to Congress 2007” concerns 2006. It states that OFHEO has the following three strategic goals:²⁵⁰

1. «Enhance supervision to ensure the Enterprises operate in a safe and sound manner, are adequately capitalized and comply with legal requirements;
2. Provide support for statutory reforms to strengthen our regulatory powers; and
3. Continue to support the national policy of an efficient secondary mortgage market which promotes homeownership and affordable housing.»

It does not remark that the goals 1 and 3 may be inconsistent, and actually are.

The report calls attention to defects in the operation of the GSEs. The central paragraph in the press release²⁵¹ about the publication of the report is the following:

«The report concludes that both Enterprises “remain a significant supervisory concern.”

“While both Enterprises made progress in correcting their problems, especially in systems, controls and financial reporting, it has taken much more time and money to correct than the GSEs or OFHEO

²⁴⁸ For similar remarks in Fannie’s AR see the appendix Fannie or the original AR in the directory USA/Fannie.

²⁴⁹ Of the pdf-file of 3/5/07. The pages of the Message are not numbered.

²⁵⁰ On p. 4 of the pdf-file under 20071031.

²⁵¹ At the beginning of the file with the report.

expected,” said [Director] Lockhart. “A key indicator of a successful remediation will be the timely filing of annual and quarterly financial statements by each company with a clean audit opinion based on a controls-based audit. I am pleased to report that both companies are working hard to achieve this goal, but they still have much to do.”»

The defects mentioned by OFHEO do not seem to be directly (!) connected with the problems the GSEs would run into later on. And the risks they have to take to realize the affordable housing goals of HUD are not mentioned.²⁵² Even though the report has a section *Asset Quality and Credit Risk Management*.²⁵³ In this section one reads:

«Asset quality is strong due to a book of business that is mostly comprised of traditional mortgage products. Delinquencies remain low and manageable, with the serious delinquency rate at about 0.61 percent of the book and losses at about 0.016 percent. Losses due to Hurricane Katrina were low and less than originally estimated. Higher-risk products such as interest-only, sub-prime, Alt-A and negative amortization loans are growing, but are currently about 20 percent of the book of business. New initiatives target product growth in some higher-risk products.»²⁵⁴

The motivation of these new initiatives is not mentioned. Neither are HUD and the “mounting mission challenges” of the annual reports of the GSEs.

In the opinion of OFHEO, the GSEs had enough capital. See the sections *Capital* of the “Report[s] of Annual Examination” of Fannie and Freddie on pp. 29 and 43 of the AR 2006.

For 2007, the low and moderate income goal, and the special affordable goal were two percent points higher than for 2006.²⁵⁵

HUD, the GSEs and OFHEO must have had regular conferences. There must be minutes of these conferences. There is no indication that they were among the “millions of pages” reviewed by the FCIC.²⁵⁶

The volume of the securitized mortgages on the balance sheet of Dutch SPVs increased more or less monotonously from practically 0 in the year 2000 to 160 B€ in 2009.²⁵⁷

A cause may be called “active” if a phenomenon would not have occurred but for activities. Activities which for this reason are called the cause(s). Man-made disasters may have active causes. But in regulated societies there can also be passive causes, or causes by omission: people or organizations who have duties, but fail to fulfill them, and by their failure allow things to happen which would not have happened if they had acted appropriately.²⁵⁸ In the case of the financial crises, governments and supervisors had duties to ensure compliance with regulations, the safe functioning of the financial system, and the general welfare. But they remained passive. They did not do what they could and should have done. They thereby allowed the development of situations which included possibilities and risks which, if realized, could run out of control and cause immeasurable suffering and damage.

The main reason for supervision is to enable economic activities which are supposedly beneficial for the general welfare, but would supposedly not take place if normal liability would be applicable. Because the possibility of abuse of freedom is evident, the activities are allowed only conditionally. The conditions are supposed to ensure that no harm is done to outsiders. Supervision has been called

²⁵² OFHEO is an agency within HUD... (Wikipedia OFHEO 16/5/12).

²⁵³ Pp. 23 and following.

²⁵⁴ Yes indeed, sub-prime. As a reminder of the fact that this concept was not as well known in 2007 as it became through the crisis. The pdf-file was made on 6/4/07, and revised 31/10/07.

²⁵⁵ FCIC report p. 510/538. For a graph see above, under 1992.

²⁵⁶ FCIC report, at the bottom of p. xi/11.

²⁵⁷ See graph 5.8 on p. 72/68 of CDW1.

²⁵⁸ In the juridical literature this is called sine qua non causation. See *PwC must pay FDIC \$625.3 million over bank's collapse: U.S. judge*, for a report about a financial crisis case where the judge found the probability of this kind of causation more than 50%. The report can be found in the directory Liability under 20180702.

into being to make sure that those responsible for risky activities comply with the conditions and/or norms. Together the conditions and supervision more or less replace liability.²⁵⁹

In general active causes can be seen. More or less by definition. Passive causes on the other hand are easily overlooked. (And up to now most often are). Absence of something can only be noted when it is realized that there could or should have been something. A passive cause can be established when it is noted that preventive action could and should have been taken, but wasn't. In the case of the financial crisis it is even worse. The governments and supervisors not only failed to do what they could and should have done. They did act: they pretended to understand the financial system and the situation, and claimed that the system was safe and sound. They were actively keeping the public asleep, and financial institutions misinformed.

To show this I give some quotes from annual reports of important supervisors. The inaction of governments seems to be practically complete, with the tell-tale exception of a repressive action against CFTC and Born in 1999.

The quotes are taken from the annual reports about 2006. The year 2006 is chosen because even the annual reports about that year were written before the crisis became a crisis. In other words: at a time when the crisis had not yet materialized, and the supervisors could still show their true worth.

I begin with the most important supervisor/ regulator: the US Fed.²⁶⁰ On p. 5 of its Annual report 2006, the Fed gives an *Overview of the Federal Reserve*. It begins as follows:

- «As the nation's central bank, the Federal Reserve System has numerous, varied responsibilities:
- a. conducting the nation's monetary policy by influencing monetary and credit conditions in the economy;
 - b. supervising and regulating banking institutions, to ensure the safety and soundness of the nation's banking and financial system and to protect the credit rights of consumers;
 - c. maintaining the stability of the financial system and containing systemic risk that may arise in financial markets;
 - d. providing financial services to depository institutions, the U.S. government, and foreign official institutions.»²⁶¹

So “maintaining the stability of the financial system and containing systemic risk that may arise in financial markets” is one of the four duties of the Fed. Nevertheless, nothing can be found in the annual report about what the Fed has done about systemic risks.²⁶²

The annual report contains a section *Economic Projections for 2007 and 2008*. The following paragraph gives a handy summary:

«In conjunction with the FOMC²⁶³ meeting in January, the members of the Board of Governors and the Federal Reserve Bank presidents, all of whom participate in the deliberations of the FOMC, provided economic projections for 2007 and 2008. The projections indicate that the participants expect sustainable expansion of real economic activity during the next two years, assuming an appropriate course for monetary policy. The central tendency of the FOMC participants' forecasts for the increase in real GDP is 2,5 percent to 3 percent over the four quarters of 2007 and 2,75 percent to 3 percent over the four quarters of 2008. The central tendency of their forecasts for the civilian unemployment rate is 4,5 percent to 4,75 percent in the fourth quarter both of this year and of 2008. [...] The economy is projected to expand at a moderate rate. Although the cooling of the housing market continues to damp economic activity, the drag on economic growth from declining construction

²⁵⁹ This is discussed more fully in the Analysis.

²⁶⁰ According to Fed AR 2006 p. 5 in 2006 the Fed had about 1850 employees. According to *The Federal Reserve System: Purposes and Functions*, 9th edition, June 2005, p. 4 the number was about 1400 in 2004.

²⁶¹ The original points have been replaced by a-d for ease of reference.

²⁶² Consistent with the (theoretically correct, but practically nonsensical and falsified) hypothesis that the system is safe as a system if the institutions are safe as institutions. Theoretically correct: namely if safe is a matter of either yes or no, or of either 100% or 0%. Which is nonsense. The Fed and all other supervisors moreover should have known that the risk management of most financial institutions was inadequate, and a danger for the safety of the system. More on this can be found in the Analysis.

²⁶³ FOMC= Federal Open Market Committee.

activity is expected to diminish later this year.»²⁶⁴

The other supervisors are now considered in alphabetical order.

DNB, Annual report 2006.²⁶⁵ DNB describes its mission as follows:

«DNB upholds “financial stability” and thereby actively contributes to the welfare of the Netherlands. For this purpose:

1. it dedicates itself together with other central banks to stable purchasing power of the euro (“monetary policy and implementation”);
2. it strives after smooth, reliable and efficient operation of the payment system;
3. it makes sure that financial institutions have enough capital to fulfill their obligations and are managed competently and with integrity (“prudential supervision”);
4. contributes to good national and international decision making by advising in the fields mentioned.»²⁶⁶

The annual reports of DNB do not have a summary but an overview. The Overview of AR 2006 has a section Risks. It contains the following paragraph:

«Asset prices, on securities and house markets, run the risk of shooting through. Low interest rates and insufficient risk awareness can cause too easy acceptance of financial risks and debts, by both households and investors. Subsequently, a sudden reversal of sentiment can have serious repercussions for financial markets and the real economy. Such a reversal could be caused by evaporation of trust in the dollar. Though this is not a new phenomenon, the risk for the world financial system is increasing every year, due to the long term deficit of the current account of the American balance of payments. To get a better feeling for the location of the risks, for their seriousness, and for possible remedies, stress tests are increasingly done both internationally and by DNB.»²⁶⁷

The analysis shows very incomplete and defective understanding. The action taken is utterly inadequate to manage the risks and their consequences. The stress tests are not described. For this reason, and because DNB’s understanding is at best only partial, it is not clear whether the tests cover all relevant risks. Note that DNB mentions the trade imbalance of the USA, but not the government debts. Even though DNB calls these debts “untenable” farther on in this AR. It does not do so in the section “Budget development” of the Overview, which only considers the budget deficit. Debt is discussed in section 3.3 “Government finances”:

«In spite of improvement of the budget situation further budget consolidation is required, because Dutch government finances move along an untenable path. In its study about the aging of the population of 2006 the Central Planning Office shows that demographic trends, increasing costs of care, and exhaustion of the natural gas reserves will negatively affect the EMU balance, and that, if nothing is done, the government debt will grow to untenable levels.»²⁶⁸

Why this is untenable, and what will happen if nothing is done about it, is not explained. In the Overview the debt or its growth is not mentioned as a risk. It is not mentioned in connection with other states: USA, Japan, Greece, etcetera.

The Overview concludes as follows:

«Globalization has once more put its stamp on growth and inflation in the world. But it has also affected other sectors, such as the representation in international financial institutions and fora, supervision, and the payment system. Consequences of globalization were clearly visible in the financial markets, and in the behavior of the actors in these markets, who developed innovative products on an unprecedented scale. This has made markets and institutions much more efficient, but some developments nevertheless cause anxiety. For example the ample liquidity proportions, the

²⁶⁴ Fed AR 2006 pp. 6-7/14-5. Note that only “an appropriate course for monetary policy” is mentioned as a condition for a rosy 2007 and 2008.

²⁶⁵ More information about DNB is given in the DNB appendix. In 2009 the staff of DNB was 1556 full time equivalent (equivalent to 1556 full time jobs).

²⁶⁶ DNB AR 2006 p. 133-4/131-2. On p. 125 of AR 2007 DNB calls this its mission.

²⁶⁷ DNB AR 2006 p. 19/17. N.B. The “serious repercussions” are not caused by insufficient risk awareness, but by the market mechanism of price “discovery”.

²⁶⁸ DNB AR 2006 p. 66/64

increasing debt ratio's, the low long term interest rate, and the low risk premiums. These phenomena increase the vulnerability of the financial system. Due to these circumstances monetary policy has not become simpler.

All in all 2006 was a good year. But because of many vulnerabilities and uncertainties there is no ground for euphoria and simple extrapolation of present developments.»²⁶⁹

Please don't forget that this is DNB's annual report. It is nice that it reflects upon developments. But in the first place it should report about how DNB has fulfilled its mission (duty). That is: what it has done to ensure de stability of the financial system.

The following is quoted from one of the most intriguing sections of the report:

«4.1.2. Regauging supervision strategy: more risk orientation and integrity.

Because of recent developments in the financial world and the fusion with the Pension and Insurance Chamber in 2004 DNB had regauged its supervision strategy. The new strategy lays more stress on risk orientation, integrity supervision and openness. [...]»²⁷⁰

Supervision is more emphatically applied in places with the greatest risk. Supervision is systematically coupled to the risk profile of the institutions under supervision. This requires a sharp actual picture of the risks and flexible use of the supervision capacity. In practice this means that the involvement of the supervisor is inversely proportional to the extent to which institutions have their financial and organizational matters in order. The actual risk situation of the institution determines the way DNB communicates with an institution or makes an inquiry.

Integrity supervision gets more emphasis as well. Important elements are reliability tests of policy makers and self assessments, in which institutions are asked to compare their compliance structure with a compliance standard. New furthermore is the selection of relevant themes as spearheads in supervision and communication. The themes are chosen on the basis of a risk analysis which transcends the institutions.»²⁷¹

Note that risk orientation as described requires quite a bit of prior knowledge and evaluation, and therefore adds a risk of unknown size. Salaries and bonuses are not mentioned and discussed in this annual report. As if the remuneration of employees of financial institutions is compatible with integrity. The (in)significance of the integrity paragraph is shown in for example the DSB failure (due to widespread false pretensions) and the appointments for the board of the largest Dutch pension fund, ABP.^{272, 273}

The so-called Corrigan report, *Toward Greater Financial Stability: A Private Sector Perspective* of 27/7/05,²⁷⁴ analyses parts of the financial system. The analyses are used to formulate recommendations aimed at improving the stability of the financial system. The report calls attention to numerous weak spots. It shows many new risks which are only partially known or understood. In fact, the report may give rise to the suspicion that we are living on a volcano.²⁷⁵ The report is written by the financial sector itself, and the recommendations are mostly directed at financial institutions. It asks relatively little of supervisors. But because of the risks it shows it requires a reaction and actions from anyone who is responsible for the stability of the system. In particular the supervisors. The report is mentioned in DNB AR 2005. It is not discussed, and no reaction is given. DNB AR 2006 states that DNB monitors the follow up. Findings are not mentioned and evaluated, and nothing is said about the sequel. Even though there is at least one significant information gap:

«The limited information provided by hedge funds and private equity firms hampers risk estimation

²⁶⁹ DNB AR 2006 p. 35/33.

²⁷⁰ Omitted: «(see publication 'Vision DNB supervision 2006-2010' at www.DNB.nl, under 'News and publications' and 'Publications DNB').»

²⁷¹ DNB AR 2006 p. 69/67.

²⁷² See the report Onderzoek DSB Bank of the commission Scheltema of 2010. In the dossier under 20100623. See also 20120619_Rapport oorzaken faillissement DSB_Curatoren.

²⁷³ See for example M. Pikaart, Wanbeleid- Algemeen Burgerlijk, Amsterdam University Press, Amsterdam, 2015.

²⁷⁴ In the directory CRMPG. Henceforth the report is abbreviated CRMPG II. Relevant paragraphs in DNB AR can be found by searching for "crmpg".

²⁷⁵ It seems to be very well justified to add this report to the (small) list of well-founded warnings. Like the GAO reports, it sketches a scenario for a perfect storm. Search for "perfect storm".

and management by financial institutions.»²⁷⁶

This is not followed by a report about advice or recommendations given, or actions taken or planned. While one of the few recommendations of CRMPG II directed at supervisors was addressed to exactly this and similar problems:

«CRMPG II recommends that the private sector, in close collaboration with the official sector, convene a high level discussion group to further consider the feasibility, costs and desirability of creating an effective framework of large exposure reporting at regulated financial intermediaries that would extend—directly or indirectly—to hedge funds. Using the indirect method, regulators would collect and aggregate large exposure data from traditionally regulated institutions and, through those institutions, collect data on hedge fund activity. Under the direct approach, hedge funds would, on a voluntary basis, provide large exposure data directly to the appropriate regulator.»²⁷⁷

DNB says nothing about this.

Note that the recommendation by CRMPG implies that nothing significant has been done with earlier similar recommendations.

CFTC, Annual report 2006.²⁷⁸ The following is quoted from “A Message from the Chairman”, Reuben Jeffery III, on p. 1:

«The Commodity Futures Trading Commission (CFTC or Commission) oversees the commodity futures and option markets in the United States (U.S.). These markets are the key source of commodity price discovery and are used as a tool by participants in the global economy to offset price risk. In recent years these trillion dollar markets, with massive economic force, have grown faster than almost any other asset class. The markets are expanding steadily in both volume and new users and their complexity is rapidly evolving with new technologies, globalization, product innovation, and greater competition.

The Commission accomplishes its mission through three strategic goals, each focusing on a vital area of regulatory responsibility. They are:²⁷⁹

1. to ensure the economic vitality of the commodity futures and option markets;
 2. to protect market users and the public; and
 3. to ensure market integrity in order to foster open, competitive, and financially sound markets.
- [...]

Over the last year, the Commission focused its resources: to help ensure that customers were protected when a futures brokerage firm collapsed amid an accounting fraud; to take action against an energy company in response to allegations of manipulation; and to actively address governance conflicts at publicly listed exchanges. We also addressed how best to disclose the impact of hedge funds and other speculators on our markets. Internationally, we engaged our regulatory counterparts and stakeholders on whether it is appropriate for an exchange based outside of the U.S. to be designated as a U.S. exchange.

Although these accomplishments are very significant in themselves, they are only part of the important contributions made daily by the dedicated staff of the Commission. We hope you will join us in applauding their efforts, which are highlighted in the pages to follow using data, both financial and performance, that is reliable and complete.»

P. 25 is the section *Forward Looking*. It mentions no serious problems. It mentions no risks or their growth. Nothing indicates that 2007 could be very different from 2006.

OCC, the Office of the Comptroller of the Currency, Annual report 2006.²⁸⁰ The inside of the front cover has the following text:

²⁷⁶ DNB AR 2006 p. 123/121. Note that this can only be partially true. Not doing business with companies providing insufficient information, and not buying products which are badly known or understood is risk management too, and very sound at that, but ignored by DNB.

²⁷⁷ CRMPG II p. 40/58.

²⁷⁸ In the directory USA/CFTC. The Annual report 2006 does not seem to mention the number of employees. On p. 42, the annual report of 2008 speaks of 448 fte.

²⁷⁹ Numbering and layout are by JFCvV.

²⁸⁰ In the directory USA/OCC, under 20061031.

«The mission of the Office of the Comptroller of the Currency is, and always has been, supervision. We supervise all types of banks in all parts of the country, from the smallest community banks to the trillion dollar “megabanks,” from “ag” banks to credit card banks, and from federal branches of foreign banks to one-branch banks that do their business close to home.

—Comptroller [John C] Dugan before the Conference on Bank Structure and Competition, Federal Reserve Bank of Chicago, May 19, 2006.»

P. 3 adds:

«Protecting the rights of bank consumers is one of our agency’s fundamental obligations.»

On p. 10 the OCC AR 2006 explains:

«The OCC pursues four strategic goals to achieve its mission:

1. A safe and sound national banking system.
2. Fair access to financial services and fair treatment of bank customers.
3. A flexible legal and regulatory framework that enables the national banking system to provide a full, competitive array of financial services.
4. An expert, highly motivated, and diverse workforce that makes effective use of OCC resources.»²⁸¹

Excluding appendices and the index, the AR has 6 chapters. The first is titled “Comptroller’s Viewpoint”. This is the opening sentence:

«I am pleased to report that the national banking system not only remained strong throughout fiscal year (FY)2006, but that both the OCC and the system are well equipped to meet the challenges that lie ahead.»

But not all is well:

«Of greater concern to me was the evidence of credit trends provided by the OCC’s Survey of Credit Underwriting Practices, a detailed review of lending standards across 18 commercial and retail product lines, based on the professional judgment of examiners-in-charge at the 73 largest national banks. The 2006 survey results indicated that loan standards in both commercial and retail lending had eased for a third consecutive year under pressure from competition and optimistic expectations for loan volume, yield, and market share. The evidence included thinner pricing, reduced amortization, weaker covenants and controls, pervasive structural concessions in such terms as tenor and guarantor requirements, and increased exceptions to lending policies.»²⁸²

Therefore:

«We undertook lower-profile, but no less important, initiatives throughout the year that further strengthen risk management in the national banking system.»²⁸³

The following is quoted as an example showing that a supervisor could successfully ask for changes in the law:

«We also proposed that Congress approve legislation increasing the community development lending authority available to national banks under Part 24 of our regulations, and that measure was adopted and signed into law.»²⁸⁴

A sketch of human resources management of OCC includes a very clear sign of belief in appearances and terrible underestimation of the risks:

«We have also made great strides in assessing the agency’s skill requirements and laying plans for the training programs needed to meet them. This is an advantageous moment to be tackling these challenges. The current sound condition of the national banking system allows us to focus on our personnel needs in a measured and orderly way.»²⁸⁵

²⁸¹ OCC AR 2006 p. 10. Note that the first three are really goals, and the fourth both means and (subordinate) goal. With respect to the workforce p. 5 of the AR notes: «Our success depends on the supervisory staff that implements OCC policies: nearly 3,000 examiners, attorneys, economists, information technology experts, and other professionals and support staff. Directly or indirectly, they are responsible for the examination and supervision of the more than 1,800 national banks, federal branches of foreign banks, and uninsured national trust companies.»

²⁸² OCC AR 2006 p. 2.

²⁸³ OCC AR 2006 p. 3.

²⁸⁴ OCC AR 2006 p. 3.

²⁸⁵ OCC AR 2006 p. 5. How to explain this carelessness given the opaqueness of crucial parts of the financial system, the numerous warnings, and the complete absence- beside blind faith- of any credible refutation?

P. 10 enumerates 10 “Fiscal year 2006 highlights”. In the context of this study highlight number 8 seems the most informative:

«Fully implemented supervision by risk for both large and community national banks. Effective supervision tailored examinations to risks presented, addressing safety and soundness issues, and applicable specialty areas. There were no national bank failures and many of the problem banks at the beginning of the year returned to sound condition. Overall, the national banking system remained in safe and sound condition, with adequate capital and earnings to support future operations.»

So what does the OCC mean by “safe and sound”? And by “adequate capital”? The OCC probably means “formally adequate capital”, as required by Basel I. But is that enough for safety and soundness? There is no sound reason to assume it does.

Chapter 4, Looking ahead, counts no more than a single page. About risks it says the following:

«Risks facing the banking industry and the OCC are increasingly interdependent, cutting across traditional disciplines and business lines. Operational and compliance risks are becoming more prominent, and traditional distinctions between credit and capital markets activities and risk management tools are eroding. Corporate governance, accounting, compliance, and customer information security continue to be high-visibility issues for the banking industry and for large, publicly traded banks in particular, accentuating the need for strong corporate governance, accounting transparency, internal controls, and audit and compliance programs.

The rapid pace of financial innovation and growing concentrations—both within individual bank’s portfolios and across industry segments—pose additional challenges and require improved risk management and information systems. Quantitative risk measurement systems will continue to become more prominent in banks’ risk management processes.

The Comptroller, the Executive Committee, and other agency officials will continue to monitor these risks closely in FY 2007 and to develop and refine strategies for the agency’s workforce to address them through supervisory and regulatory programs of onsite supervision, timely examination and policy guidance, and balanced regulatory actions. The OCC also will work with other international, federal, and state supervisors to respond to the myriad of cross-cutting issues that face the financial services industry». ²⁸⁶

Note that the AR does not give its opinion about the actual state of “corporate governance, accounting transparency, internal controls, and audit and compliance programs”. It says nothing about systemic risks, and about the ways they are being managed by OCC and its sister supervisors. Furthermore the last paragraph is hard to reconcile with the fact that OCC claimed pre-emption to prevent states reducing risks.

The final quote is from the illustration opposite “Looking ahead”:

«Large national banks will remain at the leading edge of developing new banking products and services, requiring that the OCC be at the forefront of the supervisory community in developing and maintaining expertise in assessing such products and determining associated risks.»²⁸⁷

OTS, the Office of Thrift Supervision. There is no annual report for 2006. In fact, according to the *Message from the [new] Director*, John M. Reich, in AR 2007:

«This Annual Report is the first such report from the Office of Thrift Supervision in many years, just one of several “firsts” since I came on board as OTS Director in August 2005.»²⁸⁸

The annual report shows that nothing has been learnt of the events of 2007, and that for the purposes of this study we do not have to regret the absence of an AR 2006. On the contrary, its absence provides additional information. It shows that the US government, the supervisor of the supervisors, took many years to get one of its principal financial supervisors to give a (customary) yearly account of the fulfillment of its duties.

To show that OTS is not a positive exception, and to enable comparison with the other supervisors, I give some quotes from the AR 2007. The AR has the following table of contents:

- Message from the Director;
- Strategic Focal Points;

²⁸⁶ OCC AR 2006 p. 43.

²⁸⁷ OCC AR 2006 p. 42.

²⁸⁸ P. 3, OTS AR 2007, in the directory USA/OTS.

- About the OTS;
- Year in Review
- OTS Regions;
- OTS Operations.

The first of the Strategic Focal Points is:

«1 Consolidated Supervision.

The OTS utilizes a flexible and seamless approach to its supervisory oversight. Thrift holding companies and affiliates, which range from noncomplex companies with limited activities to large, internationally active conglomerates, are examined concurrently with their thrift subsidiaries. OTS examinations are supplemented by off-site monitoring. For the most complex holding company structures, we conduct continuous supervision. We also streamline our process by coordinating our examination and supervisory efforts with other bank regulatory agencies and functional regulators of related entities, such as securities firms and insurance companies.»²⁸⁹

The first paragraph of the Year in Review draws some conclusions from the market turmoil:

«Although 2007 has been a busy year, we all should have a deep sense of satisfaction that our work has made a difference for the institutions we supervise and their customers. The unprecedented turmoil in the mortgage market in 2007, and the resulting impact on our thrifts, has showcased our remarkable talent within the agency. We have more work to do, though, and 2008 will be an exciting year as we continue our hiring initiatives and expand our outreach efforts. Our goal remains to position OTS as both a premier regulatory agency and a great place to work.»²⁹⁰

The following is from the report about the OTS West Region:

«The OTS West Region supervises institutions that hold about half of all thrift assets nationwide, including the top three federally regulated thrifts in asset size: Washington Mutual Bank (WAMU), World Savings Bank, FSB, and Countrywide Bank, FSB. The region expends significant resources to supervise these and other large thrift institutions. Yet the region is also responsible for small thrifts like Del Norte Federal Bank in southern Colorado, as well as other institutions of varying sizes across the American West and as far away as Alaska, Hawaii and Guam.

The complexity of the large institutions that have pioneered new kinds of mortgages demands a regional examination staff with deep expertise in innovative products and the ability to keep pace with rapid change. Examiners frequently must find innovative approaches to supervision. Ensuring sound loan underwriting, adequate disclosures and strong risk management has been particularly challenging for OTS West Region examiners in the current competitive, aggressive financial services marketplace.

Some thrifts in the OTS West Region have been offering non-traditional mortgage products for decades, including adjustable-rate mortgages and interest-only mortgages. OTS examiners are well-versed on how institutions can manage and mitigate the risks associated with these products to keep their operations safe and sound, and provide consumers with adequate disclosure and protection.

Examiners apply this specialized knowledge to their work with smaller thrifts and growing regional institutions. Regional officials also apply this expertise to help the agency's policy-makers craft industry guidance and address emerging challenges of national significance, such as the recent interagency guidance on non-traditional mortgage products. The OTS West Region also plays a leadership role in developing and implementing new tools to improve supervision and examination processes, such as using electronic loan data to analyze risks in loan portfolios, creating enhanced financial monitoring tools and implementing electronic tools to analyze Bank Secrecy Act risks.»²⁹¹

The Operations chapter begins with a section Supervision and Consumer Protection. The first subsection characterizes the:

«Condition of the Thrift Industry.

The thrift industry performed well during fiscal 2007 and measures of financial condition remained sound, despite challenges for home lenders.»²⁹²

Next OTS notes a “weakening” since 2005. But:

²⁸⁹ OTS AR 2007 p. 5.

²⁹⁰ OTS AR 2007 p. 13.

²⁹¹ OTS AR 2007 pp. 22-3.

²⁹² OTS AR 2007 p. 25.

«Despite these pressures, earnings for the year were positive and capital levels remained strong.»²⁹³
The second subsection concerns:

«*Risk Modelling.*

[...] OTS recently completed a major enhancement to the Net Portfolio Value (NPV) Model and began producing new reports using the Enhanced NPV Model. [...] The Enhanced NPV Model solidifies OTS's position as an industry leader in the high quality measurement of interest rate risk.»²⁹⁴

The subsection only mentions (direct) interest rate risk. This is consistent with what one can read between the lines: that in the perception of OTS there are only individual institutions, and no relevant interactions. There is no sign of awareness of any influence on the OTS-institutions of phenomena in the rest of the financial world.

SEC, the Securities Exchange Commission. According to its Annual report 2006- which it calls "Performance and Accountability Report":

«The SEC is an independent federal agency established pursuant to the Securities Exchange Act of 1934. It is headed by a bipartisan five-member Commission, comprised of the Chairman and four Commissioners, who are appointed by the President and confirmed by the Senate. The Chairman serves as the chief executive officer. The SEC is organized into four main divisions: Corporation Finance, Market Regulation, Investment Management, and Enforcement. It also has 19 functional offices. The Commission's headquarters are in Washington, D.C., and it has 11 regional and district offices throughout the country. In FY 2006, SEC received authorized funding of \$888 million. At September 30, 2006, the SEC had 3,590 staff, including 3,549 permanent staff and 41 temporary staff.»²⁹⁵

The pages 5 and 6 present vision, mission, values and goals:

«**Vision:**

The Securities and Exchange Commission aims to be the standard against which federal agencies are measured. The SEC's vision is to strengthen the integrity and soundness of U.S. securities markets for the benefit of investors and other market participants, and to conduct its work in a manner that is as sophisticated, flexible, and dynamic as the securities markets it regulates.

Mission:

The mission of the SEC is to protect investors; maintain fair, orderly, and efficient markets; and facilitate capital formation.

Values:

- Integrity
- Resourcefulness
- Accountability
- Teamwork
- Fairness
- Commitment to Excellence»²⁹⁶

«Goals:

- Enforce compliance with federal securities laws [...]
- Promote healthy capital markets through an effective and flexible regulatory environment [...]
- Foster informed investment decision making [...]
- Maximize the use of SEC resources.»²⁹⁷

²⁹³ OTS AR 2007 p. 25.

²⁹⁴ OTS AR 2007 pp. 26-7.

²⁹⁵ SEC AR 2006 p. 7/9. SEC annual reports are located in the directory USA/SEC.

²⁹⁶ SEC AR 2006 p. 5/7.

²⁹⁷ SEC AR 2006 p. 6/8, SEC AR 2008 p. 8/10.

The *Message from the chairman*, Christopher Cox, is dated November 2006. It covers two pages. It opens with the following:

«The prosperity of 300 million Americans and six billion people around the world relies on trustworthy U.S. capital markets. If you're a working American adult today, the odds are your savings are directly or indirectly invested in securities. Back in Joseph P. Kennedy's day, our first SEC Chairman could marvel that "one person in every ten" owned equities. But today, our financial markets encompass the investments, the hopes, and the dreams of half of all households. Some 57 million Americans now own stocks—and the median income for shareholders is a very middle-class \$65,000.

The U.S. Securities and Exchange Commission [= SEC] serves you by working to secure the trust in our markets that undergirds our nation's continuing prosperity in an increasingly global economy. The level of trust in our markets has enormous economic consequences—affecting everything from the affordability of food, clothing, and shelter to the creation of new jobs, increases in wages, and the protection of our retirement security. This Performance and Accountability Report helps explain how the SEC works to sustain trust in our markets.

First and foremost, the SEC is a law enforcement agency. This follows from the SEC's threefold mission to protect investors, to ensure fair and orderly markets, and to promote capital formation.²⁹⁸ These highly complementary objectives each requires a tough cop on the beat. [...]

Americans can take pride in knowing that tough, predictable enforcement is not only an essential aspect of investor protection, but also an important contributor to our nation's economic health. This past year, an unprecedented high level of collaboration with our counterpart state and federal regulators and criminal authorities ensured that our mutual efforts were even more effective, and gave America's investors even more protection for their hard earned money.»

In the AR 2006 the word fragment “derivat” is found precisely once, in the following sentences and context:

«*Cross-border exchange affiliations*.

[...] During the past several months, NASDAQ has acquired a 25 percent stake in the London Stock Exchange, and the NYSE has entered into a combination agreement with Euronext, which includes the U.K. derivatives exchange Liffe. The SEC and the College of Euronext Regulators are currently taking the necessary steps regarding the regulatory approval processes for the proposed combination of NYSE and Euronext.»

The word fragments “collater”, “subprime” en “swaps”, and the abbreviations CDO and CDS do not appear in the AR 2006.

SEC AR 2006 has three major sections:

1. Management's discussion and analysis;
2. Performance section;
3. Financial section.

The performance section is based on a set of 21 performance measures. They are defined and explained in “exhibits”. Results of their measurement are presented and analyzed (in a few sentences). The quality of the indicators is shown by the conclusions. Examples are:

«*Outcome 1.1 Potential problems or issues in the securities markets are detected early, and violations of federal securities laws are prevented.*»²⁹⁹

[...]

«*Outcome 3.1. Investors have accurate, adequate, and timely public access to disclosure materials that are useful and can be easily understood and analyzed across companies, industries, or funds.*»³⁰⁰

«*Outcome 3.2 Investors have a better understanding of the operations of the nation's securities markets.*»^{301, 302}

²⁹⁸ Take note : promote capital formation. Not : promote capital destruction.

²⁹⁹ SEC AR 2006 p. 42/44.

³⁰⁰ SEC AR 2006 p. 47/49.

³⁰¹ SEC AR 2006 p. 48/50.

³⁰² Of course, “better” need not be adequate or good.

These conclusions cannot be logically inferred from the evidence presented.³⁰³

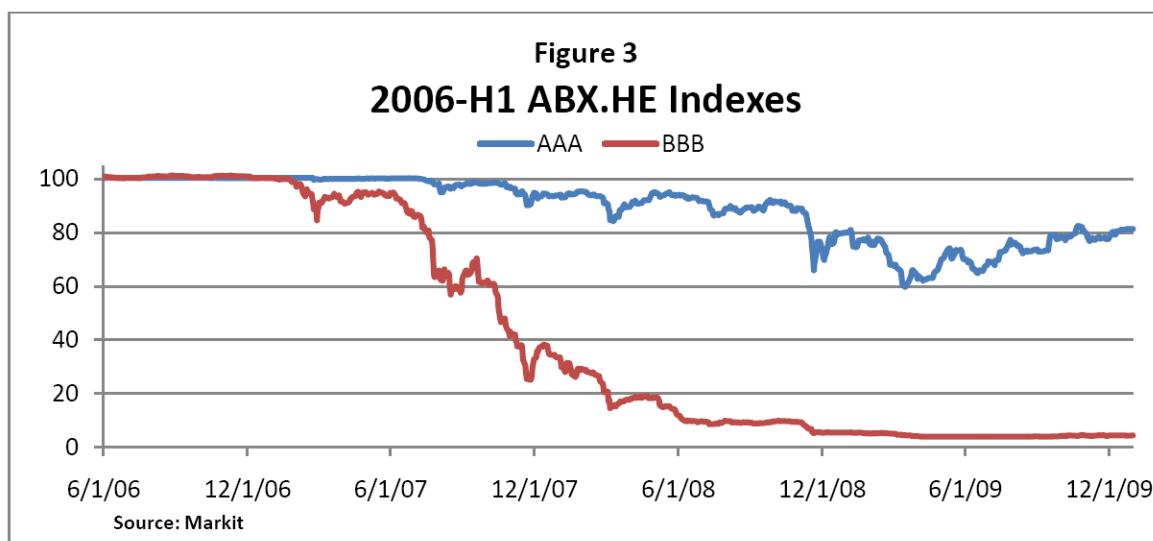

For more comprehensive analyses of supervisors, and for similar analysis of BIS, IMF and OECD, the reader is referred to the appendices.

A comparison of successive annual reports of 2006-2010 or later is very rewarding. (While reading them, ask yourself: Have any fundamental lessons been learnt?) Most of the reports can be found on the internet or in the dossier. Observations relevant in the present context can be found in the Analysis and appendices.

2007.

On 1 January, Slovenia joins the euro area.

The next two graphs can be considered as pictures of the first financial crisis along one of its crucial dimensions. The first is copied from p. 13 of the preliminary FCIC-staff study *Credit derivatives and mortgage-related credit derivatives*. The second is from LehmanLive.³⁰⁴

³⁰³ And will be contradicted (and ridiculed) by the facts.

³⁰⁴ Quoted by Markus K. Brunnermeier on p. 10 (pdf-pagenumber) of his report *Deciphering the Liquidity and Credit Crunch 2007-08* for the FCIC. It can be found in the directory FCIC/Studies, under 20100227.

Legend. «Each ABX index is based on a basket of 20 credit default swaps referencing asset-backed securities containing subprime mortgages of different ratings. An investor seeking to insure against the default of the underlying securities pays a periodic fee (spread) which- at initiation of the series- is set to guarantee an index price of 100. This is the reason why the ABX 7-1 series, initiated in January 2007, start at a price of 100. In addition, when purchasing the default insurance after initiation, the protection buyer has to pay an upfront fee of (100 - ABX price). As the price of the ABX drops, the upfront fee rises and previous sellers of Credit Default Swaps suffer losses.»³⁰⁵

Note that the indices for AAA in the two graphs do not agree. According to Markit, at the end of 2008 AAA is about 70% of its value at the end of 2006, and according to Lehman Live about 30%.³⁰⁶

At Moody's, the first time an employee used the word "crash" to characterize the housing market was in October 2006. But possibly because of uncertainty about the significance of the developments it took Moody's until 10/7/07 to announce the first large scale downgrades.³⁰⁷ On that day Moody's downgraded 399 MBS from 2006, with a value of B\$ 5.3. S&P followed suit. In October 2007 Moody's downgraded an even greater number of MBS from 2006.

Actually, in 2007 one downgrade followed the other. Not only MBS were downgraded, but (possibly) related institutions and the securities they issued just as well.³⁰⁸ Interested institutions tried to reduce the extent to which they were directly or indirectly exposed to risks, even if they had to pay a (smaller) price to reduce it. A problem was that there was great uncertainty about which institution was vulnerable for what and to what extent, and with whom one could still do business (more or less

³⁰⁵ LehmanLive, as quoted by Brunnermeier, see above.

³⁰⁶ Of course, ABX.HE and ABX 7-1 are probably different. But if this is the explanation, it would mean that the designation AAA is far less important than other characteristics.

³⁰⁷ FCIC report section 11.2 on pp. 221/249 and following.

³⁰⁸ In July-November asset backed commercial paper lost 30% of its value. See p. 274/302 of the FCIC report (in section 14.4: Federal Reserve etcetera).

safely), and with whom this was too risky. The uncertainty (opaqueness) didn't really increase, but all of a sudden it became vitally important. Bankers became increasingly more fearful of doing business with colleagues of other institutions. Of course especially with respect to relatively risky products. Which caused their value to continue falling. Trade came almost to a standstill. Due to the small number of transactions, the value of products became (even more) uncertain. After all, "no market" means: no market value. Long standing relations between institutions were severely hurt. Institutions were not trusted any more, though one more than another.

In general, securities are a kind of contract between two parties. They give rights and impose obligations. A party providing a loan often requires collateral. As in the case of a mortgage. In the subprime crisis the collateral often consisted of securities. Whose value was falling. Often contracts prescribed that in case of devaluations exceeding a certain percentage additional collateral should be provided upon request.³⁰⁹ The request is often called "margin call". In this way institutions tried to safeguard themselves against this risk. But in general both contract parties had problems. And institutions had little capital anyway. Downgrades made it ever more difficult to give additional collateral. The more so since the same phenomena made borrowing (against collateral) more difficult. Or impossible.

This description shows that a sufficiently large disturbance (devaluation) will be amplified by the (logical, rational) mechanisms which are integral parts of the financial system. Instead of being reduced or corrected. Clearly, this is the recipe for an unstable system imploding to a halt.

In early 2007 Goldman Sachs succeeded in selling the German IKB Deutsche Industriebank AG subprime MBS it wanted to get rid of. The terminology "toxic assets" turned out to be appropriate:

«In early 2007, when Goldman was looking for buyers for Abacus 2007-AC1, the synthetic CDO mentioned in part III [of the FCIC report], it looked to IKB. An employee of Paulson & Co., the hedge fund that was taking the short side of the deal, bluntly said that "real money" investors such as IKB were outgunned. "The market is not pricing the subprime [residential mortgage-backed securities] wipeout scenario," the Paulson employee wrote in an email. "In my opinion this situation is due to the fact that rating agencies, CDO managers and underwriters have all the incentives to keep the game going, while 'real money' investors have neither the analytical tools nor the institutional framework to take action before the losses that one could anticipate based [on] the 'news' available everywhere are actually realized." [Source: a law suit of 2010]. IKB subsequently purchased \$150 million of the A1 and A2 tranches of the Abacus CDO and placed them in Rhineland [an off-balance-sheet commercial paper program]³¹⁰. It would lose 100% of that investment.»³¹¹

The toxins almost killed IKB. Bankruptcy was only prevented by a takeover by its largest shareholder, KfW Bankengruppe, on 30/7/07.

This event shows that even institutions reputed to be reliable and risk avoiding can have toxic assets,³¹² and be killed by them. It added to the already existing uncertainty and risks, and reduced the willingness of institutions to do business with each other.

As the last two graphs show, the ABX index for CDS for MBS was falling since late 2006. Investment ("shadow") bank Bear Stearns had two hedge funds which were mainly collateralized with subprime mortgage-backed CDO's.³¹³ In the case of downgrading extra collateral had to be provided.³¹⁴ Investors smelt a rat, and started to sell their shares of the hedge funds. With increasing speed. In the beginning of 2007 the managers of the funds realized that this development, if continued, would be fatal. They also used illegal means to stop it. They gave investors misleading or incorrect information. This didn't help. The funds couldn't find enough money to meet their obligations. On

³⁰⁹ In the interested institutions, this obligation sometimes wasn't known to people who should have known. See FCIC report, at various pages. Search for example for "margin call".

³¹⁰ Commercial paper= short-term unsecured corporate debt. FCIC report p. 539/567 (Glossary).

³¹¹ FCIC report section 13.1 on pp. 247/275 and following.

³¹² In other words: take too much risk, do things they don't understand.

³¹³ The first part of this paragraph is based on section 12.2 of the FCIC report, on pp. 238/266 and following.

³¹⁴ This was at least the rule. For this specific case section 12.2 of the FCIC report is not explicit.

31/7/07 they filed for bankruptcy. The fund managers were criminally charged with fraud in their communication with investors. They were acquitted. The SEC filed a civil lawsuit against them.³¹⁵ On p. 127 of its fiscal year 2013 Agency Financial Report the SEC reports as following:

«In a set of cases tied to the financial crisis, the SEC, in coordination with the Federal-state Residential Mortgage-Backed Securities (RMBS) Working Group, charged J.P. Morgan Securities LLC and Credit Suisse Securities (USA) with misleading investors in RMBS offerings. The SEC charged J.P. Morgan with misstating information about the delinquency status of mortgage loans that served as collateral for an RMBS offering it underwrote. J.P. Morgan was also charged with securities laws violations rising from misconduct by Bear Stearns- with whom J.P. Morgan merged- wherein Bear Stearns failed to disclose its practice of negotiating discounted cash settlements with loan originators and keeping the proceeds without paying anything to the RMBS trusts who owned the loans. The SEC brought charges against Credit Suisse for similar activity, alleging that Credit Suisse failed to disclose its practice of retaining cash from settlements with loan originators, and for making misleading statements to investors in SEC filings about when it would repurchase mortgage loans from trusts if borrowers missed the first payment due. Both banks settled the SEC's charges, with J.P. Morgan paying \$296.9 million and Credit Suisse paying \$120 million.»³¹⁶

On 9/8/07 BNP Paribas stopped executing sales orders for three investment funds which in the two preceding weeks had lost more than 20% of their value. This is sometimes seen as the beginning of the liquidity crisis.³¹⁷

The following day, 10/8/07, the Fed announced that it would “provid[e] liquidity as necessary to facilitate the orderly functioning of financial markets”. The European Central Bank (ECB) made billions of euros available to the overnight lending markets.

On 17/8/07 the Fed facilitated borrowing for (some) financial institutions by lowering the discount rate with 50 points, from 6.25% to 5.75%. This was the first in a long series of rate cuts. The Fed moreover extended the maximal duration of discount loans from at most a few days to 30 days.

The new credit facilities were not used as intended. Institutions were afraid that use of the facilities would be interpreted as showing they were in dire straits. They preferred to borrow from the Federal Home Loans Bank. In the second half of 2007 the amount of outstanding loans of this bank increased from B\$ 235 to B\$ 875.

On the same 17/8/07 the Federal Open Market Committee of the Fed announced by means of a press release that it was aware of the worsening of the market situation, and was “prepared to act as needed to mitigate the adverse effects on the economy”.³¹⁸

In August the British bank Northern Rock got liquidity problems as a consequence of the crash of the MBS market. The MBS it produced didn't yield enough to cover its needs. For the first time in 150 years there was a bank run in the UK. In September Northern Rock requested and obtained support of the Bank of England. A search was made for a private institution that was willing and able to take over Northern Rock. In vain. The UK government thought bankruptcy and other options too harmful. It therefore nationalized the bank on 22/2/08.

In the months August-October 2007 Countrywide, the biggest mortgage bank of the US,³¹⁹ ran into fast growing problems on the repo market for overnight lending.³²⁰ Its MBS had lost too much of their

³¹⁵ The complaint and the corresponding SEC press release can be found in the SEC directory under 20121116.

³¹⁶ In principle, this report may refer to another law violation. Ambiguity being caused by somewhat different specifications. It is clear however that they concern very similar misconduct. The SEC shows that such charges may be brought successfully, and may result in reparation, if only in part.

³¹⁷ FCIC report section 13.3.

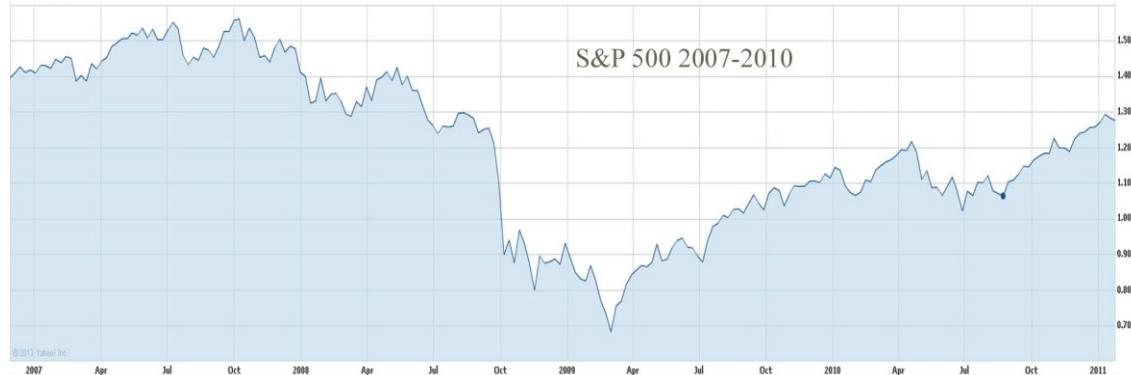

³¹⁸ FCIC report p. 252/280.

³¹⁹ «It was the biggest mortgage originator from 2004 until the market collapsed in 2007.» FCIC report p. 105/133.

³²⁰ Repo = repurchase agreement, and the repo market is a market for this kind of contract. IMF CGFS April 2008 p. 122 defines a repo contract as follows: «An agreement whereby the seller of securities agrees to buy

value to provide enough collateral. The bank needed billions, but couldn't find them. It asked the Fed for assistance, but the Fed refused. Bank of America comes to the rescue. In October it took over Countrywide.³²¹

In 2007 the Standard & Poors 500, an index for the valuation of shares, climbed by fits and starts to a maximum in October. Then it started a long slide, again by fits and starts. From March to May 2008 for example it increased 10%. This may serve as a reminder of the fact that it was not clear already in 2007 that a crisis was brewing or happening. The lowest point of the S&P 500 (in the period under consideration) would be reached only in the first half of March 2009.³²²

Monolines were companies which insured securities. Before the crisis they were thought to be 100% safe. It was supposed that they could only make profits, not losses. But monolines too turned out to be vulnerable. One of them, ACA, had a leverage of 1:100. At the end of 2007 it announced a loss of B\$ 1.7. The news went like a shock wave through the financial world. The loss was almost entirely due to CDS. In December ACA was downgraded to the status of junk. Various institutions suffered heavy losses because the “insurances” they had bought from ACA had become useless.

The monoline downgrades also affected the market for “auction-rate securities” (ARS). According to buyers, these securities had been sold to them as being completely safe and negotiable on a daily basis. When this turned out to be untrue, many of them submitted complaints against the sellers to the SEC, alleging misleading information. The complaints were declared justified, and the sellers paid B\$ 50 in damages.³²³

Partly as a consequence of the mark-to-market prescription there were accounting (“paper”) losses. At the end of 2007 many financial institutions had to write off substantial amounts.

The following quotes from the FCIC Wallison report may serve as one more part of the explication of the events of 2007-2008:

«[...] when AAA-rated PMBS³²⁴ became unmarketable they lost their value for liquidity purposes, making it difficult or impossible for many financial institutions to fund themselves using these assets as collateral for repos.»³²⁵ [...]

«Securitized assets held by financial institutions are subject to the rules of fair value accounting, and must be marked to market under certain circumstances. Thus, banks and other financial institutions that are holding securitized mortgages in the form of PMBS could be subject to large

them back at a specified time and price. The transaction is a means of borrowing cash collateralized by the securities “repo-ed” at an interest rate implied by the forward repurchase price.»

³²¹ This paragraph gives the essence of pp. 248/276 and following of the FCIC report.

³²² The graph was copied from Yahoo, on 4/6/13. Note that indexes like the Dow Jones and S&P reflect the development of the weighted average of the share prices of a chosen set of companies. From time to time the set and weights are changed. The choice has the effect of making the index grow stronger.

³²³ FCIC report p. 278/306.

³²⁴ PMBS= private MBS, as distinct from GSE-MBS. See for example FCIC report p. 542/570 (in the Glossary).

³²⁵ FCIC Wallison report p. 477/505.

accounting losses—but not necessarily cash losses—if investor sentiment were to turn against securitized mortgages and market values decline.

Accordingly, once large numbers of delinquencies and losses started showing up in the mortgage markets generally and in the mortgage pools that backed the PMBS, it was not necessary for all the losses to be realized before the PMBS lost substantial value. All that was necessary was that the market for these assets become seriously impaired. This is exactly what happened in the middle of 2007, leading immediately not only to severe adverse liquidity consequences for financial institutions that held PMBS but also to capital writedowns that made them appear unstable and possibly insolvent»³²⁶ [...]

«The inability of financial institutions to liquidate their PMBS assets at anything like earlier values had dire consequences, especially under mark-to-market accounting rules, and was the crux of the crisis. In effect, a whole class of assets—involving almost \$2 trillion—came to be called “toxic assets” in the media, and had to be written down substantially on the balance sheets of financial institutions around the world. Although this made financial institutions look weaker than they actually were, the PMBS they held, despite being unmarketable at that point, were in many cases still flowing cash at close to expected rates. Instead of a slow decline in value—which would have occurred if whole mortgages were held on bank balance sheets and gradually deteriorated in quality—the loss of marketability of these securities caused a crash in value.»³²⁷

In December 2007, Fannie sounds the tocsin:

«Finally, in a December 21, 2007, letter to Brian Montgomery, Assistant Secretary of Housing, Fannie CEO Daniel Mudd asked that, in light of the financial and economic conditions then prevailing in the country- particularly the absence of a PMBS market and the increasing number of mortgage delinquencies and defaults- HUD’s AH goals for 2007 be declared “infeasible.” He noted that HUD also has an obligation to “consider the financial condition of the enterprise when determining the feasibility of goals.” Then he continued: “Fannie Mae submits that the company took all reasonable actions to meet the subgoals that were both financially prudent and likely to contribute to the achievement of the subgoals... In 2006, Fannie Mae relaxed certain underwriting standards and purchased some higher risk mortgage loan products in an effort to meet the housing goals. The company continued to purchase higher risk loans into 2007, and believes these efforts to acquire goals-rich loans are partially responsible for increasing credit losses.”

This statement confirms two facts that are critical on the question of why Fannie (and Freddie) acquired so many high risk loans in 2006 and earlier years: first, the companies were trying to meet the AH goals established by HUD and not because these loans were profitable. It also shows that the efforts of HUD and others- including the [FCIC] Commission majority in its report- to blame the managements of Fannie and Freddie for purchasing the loans that ultimately dragged them to insolvency is misplaced.»³²⁸

The request by Mudd is also cited by the FCIC majority. The commission majority adds:

«HUD complied and allowed the GSEs to fall short without any consequences.»³²⁹

The FCIC majority quotes the letter and makes this observation to prove that GSEs could submit complaints to HUD, and that HUD listened constructively.

The following quote gives an impression of the size of the consequences of the CRA:

«In 2007, the umbrella organization for many low-income or community “advocacy groups,” the National Community Reinvestment Coalition [NCRC], published a report entitled “CRA Commitments” which recounted the substantial success of its members in using the leverage provided by the bank application process to obtain trillions of dollars in CRA lending commitments from banks that had applied to federal regulators for merger approvals. The opening section of the report states [...]:

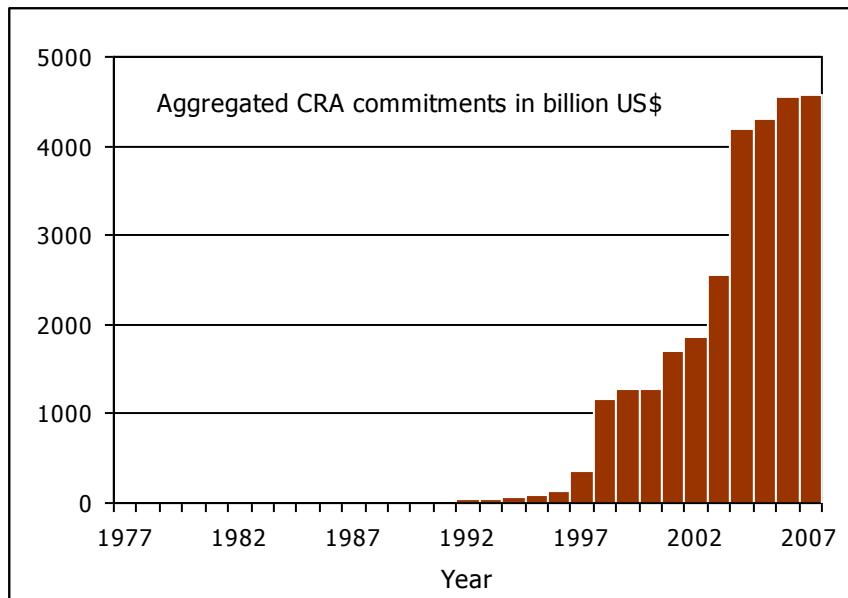

³²⁶ FCIC Wallison report p. 479/507.

³²⁷ FCIC Wallison report p. 480/508. In other words : the weak point in the system is the subjective valuation of paper. Which after all can change arbitrarily and anytime.

³²⁸ FCIC Wallison report p. 515/543.

³²⁹ FCIC report p. 185/213.

Since the passage of CRA in 1977, lenders and community organizations have signed over 446 CRA agreements totaling more than \$4.5 trillion in reinvestment dollars flowing to minority and lower income neighborhoods.»^{330, 331}

With respect to the period end 2007-beginning 2008 the FCIC majority concludes:

«The Commission concludes that some large investment banks, bank holding companies, and insurance companies, including Merrill Lynch, Citigroup, and AIG, experienced massive losses related to the subprime mortgage market because of significant failures of corporate governance, including risk management. Executive and employee compensation systems at these institutions disproportionately rewarded short-term risk taking.

The regulators- the Securities and Exchange Commission for the large investment banks and the banking supervisors for the bank holding companies and AIG- failed to adequately supervise their safety and soundness, allowing them to take inordinate risk in activities such as nonprime mortgage securitization and over-the-counter (OTC) derivatives dealing and to hold inadequate capital and liquidity.»³³²

2008.

On 1 January, Cyprus and Malta join the euro area.

Introductory remarks about the period until September 2008.

The behavior of everyone concerned in the period until September 2008 was determined to a large extent by a gradual awakening to the fact that risks are real and were being realized. Efforts were made to reduce the risks, and to limit the losses they were causing or threatened to cause.

³³⁰ FCIC Wallison report pp. 525-6/553-4. In 2012 and 2013 the documents referred to by Wallison and Pinto could not be found on the NCRC website. Neither was there any annual report. This has been checked for example on 27/5/13. The report *CRA commitments* could be found on other websites, and has been filed under 20070930. In the Acknowledgements NCRC presents itself as follows: «The National Community Reinvestment Coalition (NCRC) is the nation's trade association for economic justice whose members consist of local community based organizations. Since its inception in 1990, NCRC has spearheaded the economic justice movement. NCRC's mission is to build wealth in traditionally underserved communities and bring low- and moderate-income populations across the country into the financial mainstream.»

³³¹ The graph was made using the table on p. 8 of *CRA commitments*.

³³² FCIC conclusions from chapter 14, p. 279/307.

Chapter 16 of the FCIC report gives an impression of the situation.³³³ Most of the people involved were insufficiently prepared for the new situation. There must have been a psychic difficulty: after having worked for many years in a climate of tremendous growth and relatively easy success, people had to adjust to a climate of fear, and the possibility of losing everything. Too much had to be done in too short a time, or rather yesterday. In most organizations there must have been lack of employees fit to do the jobs required in the fundamentally changed circumstances. The new situation required other abilities (people) than the former. Employees of the organizations involved, from banks to supervisors and government, and from high to low in the organizational hierarchies, must often have lost control over their agendas and become “managed” by events. Often there must have been insufficient time and competent people to be able to take responsible decisions. Everybody may have done what he or she deemed best. But often they must have acted on the basis of inadequate know how and experience.

The Wikipedia *Subprime crisis impact timeline* begins 2008 with a paragraph “2008 in general”:

«The monoline insurance companies (AMBAC, MBIA, ACA, &c) have written vast quantities of insurance against the failure of CDO tranches. Those tranches now begin to fail by the hundreds. The credit ratings agencies downgrade the monolines from AAA, but the monolines have a unique business model. If they don't have an AAA rating, then their main line of business (bond insurance) becomes impossible for them to perform. By 2009, the monolines have all crashed.»³³⁴

March- mid September 2008.

13/3/08. «The Working Group on Financial Markets (WGF)³³⁵ released a statement with recommendations to President Bush on how to improve both the US economy along with the global economy. The objectives of the recommendations were to:

- 1) improve transparency and disclosure,
- 2) better risk awareness and management, and
- 3) stronger oversight to help mitigate systematic risk, restore investor confidence, and facilitate economic growth.

The WGF made over thirty specific recommendations which addressed:

- 1) mortgage origination,
- 2) improving investor contributions to market discipline,
- 3) reforming credit rating agencies,
- 4) strengthen global financial institutions' risk management practices,
- 5) enhance prudential regulatory policies, and
- 6) enhance the OTC derivative market infrastructure.»³³⁶

The end of Bear Stearns.

The bankruptcy of the hedge funds of Bear Stearns on 31/7/07 led to the downgrading of the parent company, and a lower quotation at the stock market. This made borrowing more expensive. In section 15.4 of its report the FCIC describes in some detail how Bear ran out of money. Thursday 13/3/08 the

³³³ But doesn't make all of the following remarks.

³³⁴ Wikipedia, the page *Subprime crisis impact timeline*, on 23/5/12. In the directory Timelines, under 20120523.

³³⁵ The Working Group on Financial Markets was created by Executive Order 12631, signed on March 18, 1988 by President Ronald Reagan. The Group was established explicitly in response to events in the financial markets surrounding October 19, 1987 ("Black Monday") to give recommendations for legislative and private sector solutions for "enhancing the integrity, efficiency, orderliness, and competitiveness of [United States] financial markets and maintaining investor confidence".

The Working Group consists of:

- The Secretary of the Treasury, or his/her designee (as Chairperson of the Working Group);
- The Chairperson of the Board of Governors of the Federal Reserve System, or his/her designee;
- The Chairperson of the Securities and Exchange Commission, or his/her designee; and
- The Chairperson of the Commodity Futures Trading Commission, or his/her designee.

This is inferred from the Wikipedia of 28/5/12, slightly shortened. According to the executive order the working group reports to the president.

³³⁶ Timeline University of Iowa. The file can be found in the directory Timelines.

bank told the SEC that it would not be able to function normally on Friday, the next business day. Sunday 16/3/08 the bank was taken over by JP Morgan, which was helped with loans and guarantees by the New York Fed. The FCIC concludes:

«The Commission concludes [that] the failure of Bear Stearns and its resulting government-assisted rescue were caused by its exposure to risky mortgage assets, its reliance on short-term funding, and its high leverage. These were a result of weak corporate governance and risk management. Its executive and employee compensation system was based largely on return on equity, creating incentives to use excessive leverage and to focus on short-term gains such as annual growth goals.

Bear experienced runs by repo lenders, hedge fund customers, and derivatives counterparties and was rescued by a government-assisted purchase by JP Morgan because the government considered it too interconnected to [allow to] fail. Bear's failure was in part a result of inadequate supervision by the Securities and Exchange Commission, which did not restrict its risky activities and which allowed undue leverage and insufficient liquidity.»³³⁷

Maybe JP Morgan would have been allowed to go broke before the take over. After the take over this was hardly possible any more.

Supervisors awake from their dreams.

The Fed began to worry. In particular about the repo market. If that would stop to operate, many of the most important financial institutions would be knocked out of business in a single blow.³³⁸ The risk of the repo market falling out was real because the downgrades of collateral made it hard or impossible to find enough acceptable collateral, and because of the downgrades of the institutions themselves.

On Sunday 16/3/08 the Fed announced that it would make available a Primary Dealer Credit Facility (PDCF), as a backup for the repo market. With suitable collateral and payment, institutions could borrow from this facility for up to 24 hours.

On 27/3/08 the Fed came with a Term Securities Lending Facility (TSLF), intended to reduce the shortage of suitable collateral. With the help of this facility institutions could borrow government loans in exchange for loans of lower quality for at most 28 days.

Both facilities were used intensively, at least in the beginning. The intensity fell fast however, for fear of reputation damage.³³⁹

Supervisors became aware of the fact that they didn't have enough information to be able to evaluate the situation. They tried to do something about it:

«On the day of Bear's demise, in an effort to get a better understanding of the investment banks, the New York Fed and the SEC sent teams to work on-site at Lehman Brothers, Merrill Lynch, Goldman Sachs, and Morgan Stanley. According to Erik Sirri, director of the SEC's Division of Trading and Markets, the initial rounds of meetings covered the quality of assets, funding, and capital.

Fed Chairman Ben Bernanke would testify before a House committee that the Fed's primary role at the investment banks in 2008 was not as a regulator but as a lender through the new emergency lending facilities. Two questions guided the Fed's analyses: First, was each investment bank liquid - did it have access to the cash needed to meet its commitments? Second, was it solvent - was its net equity (the value of assets minus the value of liabilities) sufficient to cover probable losses?»³⁴⁰

In cooperation with investment banks, Fed and SEC develop stress tests to find out whether the investments banks could cope with certain types of events:

«The stress tests, under just one estimated scenario, concluded that Goldman Sachs and Morgan Stanley were relatively sound.³⁴¹ Merrill Lynch and Lehman Brothers failed: the two banks came out

³³⁷ FCIC conclusions of chapter 15, p. 291/319.

³³⁸ In other words: this was a “systemic risk”: a risk (threat) for the system as a coherent whole.

³³⁹ FCIC report p. 294/322.

³⁴⁰ FCIC report p. 297/325.

³⁴¹ Note the adverb “relatively”. And remember that the FCIC accuses the rating agencies of having given relative ratings.

\$22 billion and \$15 billion short of cash, respectively; each had only 78% of the liquidity it would need under the stress scenario.

The Fed's internal report on the stress tests criticized Merrill's "significant amount of illiquid fixed income assets" and noted that "Merrill's liquidity pool is low, a fact [the company] does not acknowledge." As for Lehman Brothers, the Fed concluded that "Lehman's weak liquidity position is driven by its relatively large exposure to overnight [commercial paper], combined with significant overnight secured [repo] funding of less liquid assets." These "less liquid assets" included mortgage-related securities- now devalued. Meanwhile, Lehman ran stress tests of its own and passed with billions in "excess cash."³⁴²

In June 2008 the total market value of the OTC derivatives which were in circulation amounted to T\$ 20. The total "notional" amount was T\$ 670.³⁴³ On August 8, 2008, an employee of the Fed wrote in an e-mail: «We still are at the early stages of assessing the potential systemic risk from close-out of OTC derivatives transactions by an investment bank's counterparties and identifying potential mitigants.»³⁴⁴ This was not an easy job. Due to many years of deregulation and blind faith, information was deficient.

Section 16.5 of the FCIC report gives examples of fatal errors of judgment of supervisors. After many years of unwarranted positive evaluations the Fed suddenly changed course by 180 degrees, and became very critical.³⁴⁵ It is quite probable that in the course of 2007 and 2008 supervisors came to realize that they had been mistaken all the time, and that they entered an internal crisis of their own making.³⁴⁶

With increasing pressure, employees of financial institutions tend to violate more behavioral norms more seriously. The history of the crisis provides numerous examples. See the FCIC report. In general the information which chief officers of institutions give the outside world is one sidedly positive. Information that might give a negative impression is left out. Sometimes information is even downright incorrect. Furthermore, in the years of the crisis, it seems to be the rule (with exceptions) that when a major bank has to report a loss, the CEO (and maybe some close associates) steps down, and receives a bonus of tens of millions of dollars.³⁴⁷

*Fannie and Freddie up to and including 7/9/08.*³⁴⁸

In 2007 and 2008 Fannie and Freddie went downhill too. Their decline is described in some detail because they were very large and influential, had their own supervisor, and because their history sheds much light on the functioning of the GSEs, the supervisor, and other interested actors. Including their functioning in the preceding years.

Fannie and Freddie always had relatively little capital, even less than other institutions.

«By the end of 2007, guaranteed and portfolio mortgages with FICO scores less than 660 exceeded reported capital at Fannie Mae by more than seven to one; Alt-A loans and securities, by more than six to one. Loans for which borrowers did not provide full documentation amounted to more than ten times reported capital.»³⁴⁹

GSEs and supervisors seem to have assumed that the risks would at most affect profitability. But due to their weak capital situation, the GSEs would not be able to sustain any serious set-back. In other

³⁴² FCIC report p. 298/326. The rectangular brackets are from the FCIC report.

³⁴³ According to p. 542/70 of the Glossary of the FCIC report, "notional amount" = «A measure of the outstanding amount of over-the-counter derivatives contracts, based on the amount of the underlying referenced assets.» It may therefore be compared with an insurance of \$ 300 for a house of \$ 250,000. The last value is the "notional amount".

³⁴⁴ FCIC report p. 298/326.

³⁴⁵ See the subsection Wachovia on pp. 304/332 and following in the FCIC report.

³⁴⁶ This is not supported by the contents of the annual reports of 2009 and later.

³⁴⁷ Search in the FCIC report for "compensation". Examples can be found on pp. 259/87, 265/93 and 273/301.

³⁴⁸ This subsection is based on chapter 17 of the FCIC report.

³⁴⁹ FCIC report p. 312/40. FICO score = A measure of a borrower's creditworthiness based on the borrower's credit data; developed by the Fair Isaac Corporation. FCIC report, Glossary, p. 541/69.

words: trouble was only a matter of time, of waiting. After all, the experience of centuries tells us that (“unexpected”) set-backs are the rule, not the exception. It is not reasonable to assume that the winds are always favorable. (And to ignore warnings).

In November 2007 Fannie and Freddie announced that they would close the year with a net loss. At the end of December it became known that losses greater than respectively 1.45 and 1.7% would mean that Fannie and Freddy were insolvent. At least, if they really had the capital they said they had. There was reason to suspect that they didn’t.³⁵⁰

In the beginning of 2008 the economy didn’t run very well. The mortgage market did poorly. Congress therefore wanted the GSEs to do what they could to keep the mortgage market going. Pressure was exerted on OFHEO and the Treasury (= ministry of finance) to reduce the operational restrictions on the GSEs. OFHEO and Treasury gave in. As a consequence, the capital requirements of the GSEs were gradually reduced. In other words: they were allowed to increase their leverage. And thereby their risks.

In May Fannie and Freddie announced an operational loss for the first quarter of 2008. OFHEO nevertheless continues lowering their capital requirements.

In July Fannie is threatened with illiquidity. The value of its collateral was insufficient to borrow on the repo market what it needed. It asked the Fed for a loan. The Fed gave the NY Fed on 13/7/08 permission to provide a loan.

«At the end of July, Congress passed the Housing and Economic Recovery Act (HERA) of 2008, giving [Treasury secretary] Paulson his bazooka- the ability to extend secured lines of credit to the GSEs, to purchase their mortgage securities, and to inject capital. The 261-page bill also strengthened regulation of the GSEs by creating FHFA, an independent federal agency, as their primary regulator, with expanded authority over Fannie’s and Freddie’s portfolios, capital levels, and compensation. In addition, the bill raised the federal debt ceiling by \$800 billion to \$10.6 trillion, providing funds to operate the GSEs if they were placed into conservatorship.»³⁵¹

The FHFA, the Federal Housing Finance Agency, replaced OFHEO. FHFA had the same director as OFHEO.

In the meantime, employees of the Fed, OCC and Morgan Stanley made an inquiry into the financial situation of the GSEs.

«The Fed and the OCC discovered that the problems were worse than their suspicions and reports from FHFA had led them to believe. According to [Timothy] Clark [of the Fed], the Fed found that the GSEs were significantly “underreserved,” with huge potential losses, and their operations were “unsafe and unsound.” The OCC rejected the forecasting methodologies on which Fannie and Freddie relied. Using its own metrics, it found insufficient reserves for future losses and identified significant problems in credit and risk management. [...]»

Nearly all of the loss projections calculated by Morgan Stanley showed that Fannie would fall below its regulatory capital requirement. Fannie’s projections did not.»³⁵²

The inquiry could only take place because the GSEs needed money. Previously GSEs nor OFHEO (!) tolerated snoopers:

«He [Clark] said that previously, “The GSEs [saw] the Fed as public enemy number one. . . . There was a battle between us and them.” Clark added, “We would deal with OFHEO, which was also very guarded. So we did not have access to info until they wanted funding from us.”»³⁵³

In the two weeks between 22/8 and 4/9 the opinion of FHFA about the GSEs changed radically. A nuanced positive judgment was replaced with a long list of serious worries and complaints. For 22/8/08 we have the following testimony:

«On August 22, FHFA informed both Mudd and Syron [CEOs of resp. Fannie and Freddie] that their firms were “adequately capitalized” under the regulations, a judgment based on financial information that was “certified and represented as true and correct by [GSE] management.” But FHFA

³⁵⁰ FCIC report p. 312/40.

³⁵¹ FCIC report p. 317/45.

³⁵² FCIC report p. 317/45.

³⁵³ FCIC report p. 317/45.

also emphasized that it was “seriously concerned about the current level of Fannie Mae’s capital” if the housing market decline continued.»³⁵⁴

It seems incomprehensible that this could be signed by somebody who knew about the inquiry of the Fed, OCC and Morgan Stanley. Was the FHFA kept in the dark? Maybe, but not necessarily. Taking account of the ever increasing AH-goals and the worries expressed in the annual reports of the GSEs, the relatively positive judgments and care-free attitude of OFHEO had already been a mystery for years.³⁵⁵ From this point of view there was at least continuity and consistency.

For 4/9 the evidence consists of letters with reports of the FHFA to the GSEs. FHFA seems to have finally seen the light (or black hole). Regarding the appendix about Fannie the FCIC notes:

«The 21-page report sent to Fannie identified sweeping concerns, including failures by the board and senior management, a significant drop in the quality of mortgages and securities owned or guaranteed by the GSE, insufficient reserves, the almost exclusive reliance on short-term funding, and the inability to raise additional capital. FHFA admonished management and the board for their “imprudent decisions” to “purchase or guarantee higher risk mortgage products.” The letter faulted Fannie for purchasing high-risk loans to “increase market share, raise revenue and meet housing goals,” and for attempting to increase market share by competing with Wall Street firms that purchased lower-quality securities. FHFA, noting “a conflict between prudent credit risk management and corporate business objectives,” found that these purchases of higher-risk loans were predicated on the relaxing of underwriting and eligibility standards. [Etcetera, etcetera]»³⁵⁶

The evaluation and conclusion for Freddie were even worse.³⁵⁷

The same turnaround can be observed in the transition from the 2008 (Annual) Report of OFHEO³⁵⁸ to the 2008 (Annual) Report of successor FHFA³⁵⁹, both to Congress. Even though James B'. Lockhart III was director of both OFHEO and FHFA. The most amazing is of course not the last judgment, but the earlier one.³⁶⁰ And the sudden turnaround. The FCIC explains neither.

CEO Daniel Mudd of Fannie told the FCIC that the letter of 4/9 came as a complete surprise:

«Mudd told the FCIC that its regulator had never before communicated the kind of criticisms leveled in the September 4 letter. He said the regulator’s “chronicling of the situation” then was “inconsistent with what you would consider better regulatory practice to be- like, first warning: fix it; second warning: fix it; third warning: you’re out of here. Instead, they went from zero to three with no warning in between.” A review of the examination reports and other documents provided by FHFA to the FCIC largely supports Mudd’s view on this specific point. While OFHEO’s examination reports noted concerns about increasing credit risk and slow remediation of deficiencies required by the May 2006 consent agreement, they do not include the sweeping criticisms contained in the September 4 letter.»³⁶¹

Treasury secretary Paulson, Fed chairman Bernanke and director Lockhart of the FHFA tried to show the boards of the GSEs that they could better accept conservatorship of FHFA than continue independently. The GSEs would only be able (be permitted) to borrow money from the government if they agreed with conservatorship. So they didn’t have a choice. The Treasury announced the conservatorship on Sunday 7/9/08.³⁶² The CEOs of the GSEs had to go.³⁶³

It was not a real takeover, but the shares of the GSEs nevertheless lost much of their value, and worsened the capital position of the shareholders. This caused downgrades and bankruptcies.

Paulson and under secretary Kashkari expected that the intervention would stabilize the market, and give a breathing space of about a month. But the market saw the intervention primarily as a sign of

³⁵⁴ FCIC report p. 318/46. As always, the FCIC report gives the source.

³⁵⁵ Unless one doubts the independence of OFHEO because it is part of HUD.

³⁵⁶ FCIC report p. 318/46.

³⁶⁰ Although the surprise about the higher risk mortgages is false and treacherous. OFHEO should have warned for years, and objected against HUD’s affordable housing goals. As the next quote shows, FCIC agrees.

³⁶¹ FCIC report pp. 319-20/47-8.

³⁶² New York Times, *Credit crisis- The essentials overview*, the version “updated 10/1/11”.

³⁶³ From 2000-2008 CEO Mudd of Fannie had been paid M\$ 65. FCIC report p. 322/50.

mismangement of the GSEs and the high risk of their products.³⁶⁴

In retrospect, some of those involved offer explanations, though not of OFHEOs or their own silence of years:

«When interviewed by the FCIC, FHFA officials were very critical of Fannie's management. John Kerr, the FHFA examiner (and an OCC veteran) in charge of Fannie examinations, minced no words. He labeled Fannie “the worst-run financial institution” he had seen in his 30 years as a bank regulator. Scott Smith, who became associate director at FHFA after that agency replaced OFHEO, concurred; in his view, Fannie's forecasting capabilities were not particularly well thought out, and lacked a variety of stress scenarios. Both officials noted Fannie's weak forecasting models, which included hundreds of market simulations but scarcely any that contemplated declines in house prices. To Austin Kelly, an OFHEO examination specialist, there was no relying on Fannie's numbers, because their “processes were a bowl of spaghetti.” Kerr and a colleague said that they were struck that Fannie Mae, a multitrillion-dollar company, employed unsophisticated technology: it was less techsavvy than the average community bank.»³⁶⁵

This raises the question why the opinions of these people were ignored by their management for so long, and why these people accepted its passivity, knowing the risks and the duty of OFHEO. The observations anyway underline the systematic dysfunctioning of OFHEO, and that of the responsible secretary: that of HUD.

In anticipation of Lehman's bankruptcy.

On 14/9/08, ten of the world's largest banks agree to pool \$70 billion in a liquidity fund to mitigate the expected failure of Lehman Brothers. The ten banks involved are Bank of America, Barclays, Citigroup, Credit Suisse, Deutsche Bank, Goldman Sachs, JP Morgan Chase, Merrill Lynch, Morgan Stanley, and UBS. Each of the banks will be able to borrow up to one third of the fund by pledging a wide range of collateral that is not accepted for Fed loans.

The Fed also relaxed regulations and said it would allow a broader range of collateral for Fed loans and that it will also suspend the rule that prohibits deposit-taking banks from using deposits to help finance their investment banking subsidiaries until January 30, 2009.³⁶⁶

*The bankruptcy of Lehman 15/9/08.*³⁶⁷

After the fall of Bear Stearns, Lehman was the banking institution with the lowest rating. Lehman had to pay a higher premium to insure its debt than its sister institutions. Lehman contributed to its own downgrading by including debatable asset valuations in its financial reports. This made business relations and investors distrustful. The number of margin calls³⁶⁸ increased.

«As of mid-June, 62% of Lehman's liquidity was dependent on borrowing against nontraditional securities, such as illiquid mortgage-related securities- which could not be financed with the PDCF and of which investors were becoming increasingly wary.»³⁶⁹

On 10/7/08 two repo lenders of Lehman tell clearing bank J P Morgan that they don't want to do business with Lehman any more.

The Fed and Treasury had already been thinking and talking about solutions for over a month. They didn't know what to do. There was a lack of information. Information was gathered circumspectly, to avoid weakening Lehman's position unnecessarily. Only on 5/9/08 did Lehman inform the NY Fed about its OTC portfolio.

People from the banking world feared that the fall of Lehman would cause the fall of many other institutions. They therefore requested the Fed to develop a solution which included more than

³⁶⁴ Once more, Paulson and Kashkari (and their subordinates) were mistaken. Once more, since the responsibility for the healthy operation of the financial system ultimately rests with the Treasury secretary. For more on this aspect see the Analysis.

³⁶⁵ FCIC report pp. 321-2/349-50.

³⁶⁶ Credit Crisis Timeline, University of Iowa. Dated 1/7/09.

³⁶⁷ Chapter 18 of the FCIC report gives a detailed report.

³⁶⁸ Margin call= request (demand) for additional collateral. The call is based on obligations stipulated in the security (contract).

³⁶⁹ FCIC report p. 328/56.

Lehman.³⁷⁰

On 10/9/08 Lehman reported a loss of B\$ 4 for the third quarter. This further reduced confidence, and stimulated their business relations to minimize their exposure to Lehman.

On Thursday 11/9/08 J P Morgan asked Lehman to deposit B\$ 5 cash collateral before the opening of business Friday. Lehman didn't have this money. Lehman employees were treated disrespectfully by those of J P Morgan. Lehman nevertheless succeeded in coughing up the requested money.

«Early Friday evening [12/9/08], Treasury Secretary Paulson summoned the [...] CEOs of the big Wall Street firms to the New York Fed's headquarters. Paulson told them that a private-sector solution was the only option to prevent a Lehman bankruptcy. The people in the room needed to come up with a realistic set of options to help limit damage to the system. A sudden and disorderly wind-down could harm the capital markets and pose the significant risk of a precipitous drop in asset prices, resulting in collateral calls and reduced liquidity: that is, systemic risk.³⁷¹ He could not offer the prospect of containing the damage if the executives were unable to fashion an orderly resolution of the situation, as had been done in 1998 for Long-Term Capital Management.³⁷² Paulson did offer the Fed's help through regulatory approvals and access to lending facilities, but emphasized that the Fed would not provide "any form of extraordinary credit support." As New York Fed General Counsel Tom Baxter told the FCIC, Paulson made it clear there would be no government assistance, "not a penny."

H. Rodgin Cohen, a veteran Wall Street lawyer who has represented most of the major banks, including Lehman, told the FCIC that the government's "not a penny" posture was a calculated strategy: "I don't know exactly what the government was thinking, but my impression was they were playing a game of chicken or poker or whatever. It was said on more than one occasion that it would be very politically difficult to rescue Lehman. There had been a lot of blowback after Bear Stearns."³⁷³

Saturday morning it seemed as if Barclays would buy Lehman, except for B\$ 45 assets which would be taken over by a consortium.

The same Saturday morning Merrill Lynch CEO John Thain concluded that Lehman would not be saved, and that his bank would be the next in line. He therefore contacted Bank of America (BofA) CEO Ken Lewis. On Sunday the CEOs agreed that BofA would buy Merrill for \$ 29 per share.

On Sunday Barclays realized that the deal would entail an unknown but major risk, already before the acquisition would be effectuated. It wanted the Fed to assume that risk, but Paulson and the Fed refused.

On this same day the Treasury department and the Fed put pressure on Lehman to file for bankruptcy. Harvey Miller, bankruptcy counsel of Lehman, and his colleagues reported to their Board. At the request of the Board they contacted Baxter of the NY Fed to ask whether the government actually ordered them to file for bankruptcy. Of course, Baxter could not agree with such a formulation. He said that the position of the government had been made "perfectly clear" in the meeting. President McDade of Lehman told his Board that Lehman could not stay in business without government money. Thereupon the Board agreed with filing for bankruptcy. Filing took place 1:45 AM Monday morning 15/9/08.

It is clear that the Fed and the government underestimated the consequences of the bankruptcy of Lehman.³⁷⁴ Even the direct consequences were not negligible:

«As for Lehman itself, the bankruptcy affected about 8,000 subsidiaries and affiliates with \$600 billion in assets and liabilities, the firm's more than 100,000 creditors, and about 26,000 employees. Its failure triggered default clauses in derivatives contracts, allowing its counterparties to have the option of seizing its collateral and terminating the contracts. After the parent company filed, about 80 insolvency proceedings of its subsidiaries in 18 foreign countries followed. In the main bankruptcy

³⁷⁰ FCIC report p. 333/61.

³⁷¹ A responsibility of Paulson and the Fed, not of the private banks. In other words: because of their function, the attitudes of Paulson and the Fed were inadmissible.

³⁷² But note that Lehman was of the order of 100 times as big as LTCM. For LTCM figures see under 1998, for figures about Lehman see below.

³⁷³ FCIC report p. 334/62.

³⁷⁴ Even if those responsible pretend otherwise. For example Bernanke, FCIC report p. 339/367. The section "A CALAMITY" gives more instances of inconsistent utterances of Bernanke. ("Inconsistent" implies: untruthful).

proceeding, about 66,000 claims- exceeding \$873 billion- have been filed against Lehman as of September 2010.»³⁷⁵

For many years supervisors and governments had ignored analyses of relationships in the financial system, and warnings about them. In the months and days before the bankruptcy of Lehman their thinking had not changed fundamentally. Witness the following:

«As Bernanke acknowledged to the FCIC [in 2010], however, his explanation for not providing assistance to Lehman was not the explanation he offered days after the bankruptcy- at that time, he said that he believed the market was prepared for the event.»³⁷⁶

This would have been an acceptable excuse if he could not and should not have known better. But he could and should. His later explanation is that he had no choice.³⁷⁷ Because of the systematic dereliction of duty of the Fed since 1994 at the latest this can be considered as utterly misleading. Moreover, if the Fed had somehow saved Lehman he could have said the same: that he had no choice.

AIG up to and including the bailout by the Fed on 16/9/08.

“AIG” means: American International Group. It was the biggest insurance company in the USA. For the financial system it was more important than Lehman, because “every bank and dealer has exposure to them”.³⁷⁸

On 11/8/08 supervisor OTS of AIG was still thinking that AIG had no liquidity problems. The NY Fed thought otherwise. An analysis of Kevin Coffey of the NY Fed of 14/8/08 listed various red lights.³⁷⁹ They were confirmed by a report that Goldman Sachs sent to its customers on 18/8/08. It was entitled “Don’t Buy AIG: Potential Downgrades, Capital Raise on the Horizon”.

On 12/9/08 a delegation of AIG went to the NY Fed and asked what it could do to get a loan. For AIG was not eligible for the PDCF. According to the delegation, they could hold out at most a week without a loan. They expected a downgrade, and in its wake margin calls which they would not be able to answer. They didn’t have enough collateral to extend loans and borrow more, and saw no possibilities for raising capital.

The Fed tried private sector solutions. But after the bankruptcy of Lehman the private sector didn’t want to increase its risks by unknown amounts.³⁸⁰

After the closing of the market on Monday 15/9/08 AIG told the NY Fed that it didn’t have enough money to be able to operate the next day. The NY Fed decided to bail out AIG in the same way as Bear Stearns. In the first instance the NY Fed gave AIG a loan of B\$ 85 (against collateral). Ultimately the government loaned AIG a total of B\$ 182. A Congressional Oversight Panel «faulted the government for deciding to bail out AIG too hastily: “With AIG, the Federal Reserve and Treasury broke new ground. They put the U.S. taxpayer on the line for the full cost and full risk of rescuing a failing company.” The Treasury Department defended its decision, saying that the panel report “overlooks the basic fact that the global economy was on the brink of collapse and there were only hours in which to make critical decisions.”»³⁸¹

The second half of September 2008.

The bailout of AIG took place on the day after the bankruptcy of Lehman and the take over of

³⁷⁵ FCIC report pp. 339-40/67-8.

³⁷⁶ FCIC report p. 340/68. Note by the way that the remark of Bernanke is rather ambiguous. One can be prepared, even as good as possible, without being able to survive. One cannot always be prepared sufficiently for everything. Bernanke and Paulson could not and should not have assumed that one can. They themselves could and should have done things no individual institution (or group of institutions) could have done. Possibly the financial system could have been safe if and only if supervisors and government had done their duty. But they didn’t. By deregulation and enforcing affordable housing goals the government even made it more unsafe.

³⁷⁷ FCIC report p. 341/69.

³⁷⁸ FCIC report p. 347/75.

³⁷⁹ Summarised in the FCIC report on p. 346/74.

³⁸⁰ In the given situation the main problem was: are the risks we run bearable? Many actors had serious doubts about the answer. In such a situation accepting an additional risk can easily be fatal.

³⁸¹ FCIC report p. 350/78. Of course, if you wait long enough, you may have to decide in seconds. This and similar situations could have been studied years before. Scenario’s could and should have been ready.

Merrill Lynch by the Bank of America. In the eyes of the financial institutions, these events, and the acceleration in the rate at which they unfolded, confirmed the fear that they stood at the brink of the abyss, and that the same applied to the institutions they depended on. The Fed provided loans on a large scale. But this did not eliminate the uncertainty about the continuity or survival of business relations.

Investors tried to exchange debt securities of even the most renowned companies for the most reliable securities, treasury bonds. Trust had completely evaporated. People were only interested in insured securities. Insurance costs rose from 1 to 5%. On 19/9/08 the US government reacted with two new loan/ insurance programs. This probably slowed down the pace of events. Temporarily.

The OTC market came almost to a standstill. This «greatly diminished the ability of institutions to enter or unwind their contracts or to effectively hedge their business risks at a time when uncertainty in the financial system made risk management a top priority.»³⁸²

On 18/9/08 the SEC (temporarily) prohibited shortselling of securities of a large number of financial institutions. Treasury secretary Paulson started an effort to get approval of Congress for a Troubled Asset Relief Program (TARP).

For the time being the financial system continued sliding downwards:

«To protect themselves, hedge funds pulled billions of dollars in cash and other assets out of Morgan Stanley, Merrill, and Goldman in favor of prime brokers in bank holding companies, such as JP Morgan; big foreign banks, such as Deutsche Bank and Credit Suisse; and custodian banks, such as BNY Mellon and Northern Trust, which they believed were safer and more transparent.»³⁸³

Similarly, the hedge funds became victims of runs by their customers. They pulled back about 20% of their investments, with a total value of more than T\$ 2. Because of leverage effects the impact of these withdrawals was much larger:

«The hedge fund run became a \$32 billion torrent on Wednesday [17/9/08], the day after AIG was bailed out and the day that “many of our sophisticated clients started to liquefy,” as Wong [Morgan Stanley’s treasurer] put it. Many of the hedge funds now sought to exercise their contractual capability to borrow more from Morgan Stanley’s prime brokerage without needing to post collateral. Morgan Stanley borrowed \$13 billion from the Fed’s PDCF on Tuesday, \$27 billion on Wednesday, and \$35.3 billion on Friday.»³⁸⁴

Two repo clearing banks, JP Morgan en BNY Mellon, start asking more collateral:

«On Saturday [20/9/08], Morgan Stanley executives briefed the New York Fed on the situation. By this time, the firm had a total of \$35.3 billion in PDCF funding and \$32.5 billion in TSLF funding from the Fed. Morgan Stanley’s liquidity pool had dropped from \$130 billion to \$55 billion in one week. [... The] run vastly exceeded the company’s most severe scenario in stress tests administered only one month earlier.»³⁸⁵

Reality was much worse than the stress tests assumed.

Goldman had similar problems. Together with Morgan Stanley it requested the Fed on Sunday 21/9/08 permission for becoming a holding company. In cooperation with the department of Justice their request was approved with exceptional speed. Whereupon «Morgan Stanley instantly converted its \$39 billion industrial loan company into a national bank, subject to supervision by the Office of the Comptroller of the Currency (OCC), and Goldman converted its \$26 billion industrial loan company

³⁸² FCIC report p. 365/93. This sentence is highly debatable. It raises doubts about the understanding of risk management by the author of the sentence. The point being that it is the risk management of the past years that is being put to the test. In the crisis risks became and become reality. In September 2008 it should have been much less a matter of (new) risk management than executing plans made in the framework of risk management and scenario analyses in the past, in order to avoid or reduce losses. Unless every activity directed at reduction of loss is called “risk management”. The sentence says much about the way the FCIC perceives risk and risk management. It is defined and argued badly, if at all. (One can utter phrases which have no meaning. One can utter phrases without understanding what they mean).

³⁸³ FCIC report p. 360/88.

³⁸⁴ FCIC report p. 361/89.

³⁸⁵ FCIC report p. 362/90.

into a state-chartered bank that was a member of the Federal Reserve System, subject to supervision by the Fed and New York State. The Fed would begin to supervise the two new bank holding companies. The two companies gained the immediate benefit of emergency access to the discount window for terms of up to 90 days».³⁸⁶ An important side effect of the operation was that it showed other market participants that it was highly improbable that these institutions would go bankrupt. An important uncertainty had been eliminated (almost).

It was not enough to stop the slide. Washington Mutual was next in line:

«Washington Mutual, Inc. [...], abbreviated to WaMu, was a savings bank holding company and the former owner of Washington Mutual Bank, which was the United States' largest savings and loan association until its collapse in 2008.

On Thursday, September 25, 2008, the United States Office of Thrift Supervision (OTS) seized Washington Mutual Bank from Washington Mutual, Inc. and placed it into the receivership of the Federal Deposit Insurance Corporation (FDIC). The OTS took the action due to the withdrawal of \$16.7 billion in deposits during a 9-day bank run (amounting to 9% of the deposits it had held on June 30, 2008). The FDIC sold the banking subsidiaries (minus unsecured debt or equity claims) to JPMorgan Chase for \$1.9 billion, which JPMorgan Chase had been planning to acquire as part of a confidential plan internally nicknamed Project West. All WaMu branches were rebranded as Chase branches by the end of 2009. The holding company, Washington Mutual, Inc., was left with \$33 billion in assets, and \$8 billion debt, after being stripped of its banking subsidiary by the FDIC. The next day, September 26, Washington Mutual, Inc. filed for Chapter 11 voluntary bankruptcy in Delaware, where it is incorporated.

With respect to total assets under management, Washington Mutual Bank's closure and receivership is the largest bank failure in American financial history. Before the receivership action, it was the sixth-largest bank in the United States. According to Washington Mutual Inc.'s 2007 SEC filing, the holding company held assets valued at \$327.9 billion.»³⁸⁷

OTS had a responsibility because WaMu was a “thrift”.³⁸⁸ The take over had been prepared by the FDIC and J P Morgan. WaMu disagreed with the take over, and filed suit against the FDIC.³⁸⁹ The wisdom of the conduct of the supervisors was doubted by the Treasury department. The supervisors may have underestimated the disturbing effect of their intervention on the market.³⁹⁰ The partial take over could not be called a rescue operation. It caused substantial capital annihilation. Uninsured creditors lost all their money. The operation was one more warning that one could better try to save what one could. As a consequence, the conduct of OTS and FDIC made some risks greater instead of smaller.

Next came Wachovia, the fourth-largest bank holding company. It was «the largest holder of payment-option ARMs, the same product that had helped bring down WaMu and Countrywide».³⁹¹ In September it saw liquidity problems coming, and asked support from the Fed. The day after the fall of WaMu, Friday 26/9/08, there was a run on Wachovia, or an acceleration of the run. Business relations began to refuse doing business with them. Roll-over was refused.³⁹² Quotes of Wachovia related securities fell precipitously. In the evening Wachovia told the Fed that it had big problems. According to the FCIC «Government officials were not prepared to let Wachovia open for business on Monday,

³⁸⁶ FCIC report pp. 362-3/90-1.

³⁸⁷ Wikipedia, page “Washington Mutual” (19/5/12). In the quote the footnote references have been dropped.

³⁸⁸ FCIC report p. 365/93. According to Merriam-Webster (2002) a thrift is a savings bank or savings and loan association.

³⁸⁹ According to the Wikipedia, page “Washington Mutual” (19/5/12): «On March 20, 2009, Washington Mutual Inc. filed suit against the FDIC in the United States District Court for the District of Columbia, seeking damages of approximately \$13 billion for what they claim to be an unjustified seizure and an extremely low sale price to JPMorgan Chase. JPMorgan Chase promptly filed a counterclaim in the Federal Bankruptcy Court in Delaware, where the Washington Mutual bankruptcy proceedings had been continuing since the Office of Thrift Supervision's seizure of the holding company's bank subsidiaries.»

³⁹⁰ See for example the FCIC report p. 367/95, the second full paragraph, about the run on Wachovia.

³⁹¹ FCIC report p. 366/94.

³⁹² Roll-over is equivalent with prolongation of a loan, but generally refers to short term loans.

September 29, without a deal in place.»³⁹³ The Fed started looking for banks willing and able to take over Wachovia. Obstacles were: knowledge of the books, i.e. the risks, and government support, in this case from the FDIC. Wachovia itself came with a proposal for independent continuation.

The FDIC had not yet agreed with the applicability of the systemic risk exception, a formal condition for certain measures. The board of the FDIC discussed this on Monday morning 29/9/08, 6 AM. OCC, OTS and Treasury had representatives in the board. Within half an hour the board agreed to the exception. An offer of Citigroup was accepted. The board of Wachovia also accepted this offer. A short time later the more or less provisional contracts were signed.

Tuesday 30/9/08 a change took place in the tax regulation. According to the new rules losses of a company which had been taken over could be written off at once and completely instead of distributed over a number of years.

Thursday morning 2/10/08 Wells Fargo made a new offer. It offered \$ 7 per share, seven times the offer of Citigroup. It would not require government support. At 11:00 PM the board of Wachovia convened an emergency session, and accepted the offer unanimously.

The CEO of Citigroup was informed Friday 3/10/08 3:00 AM. He was surprised and disappointed. He thought he had a deal. He asked if he could take over Wachovia on the same conditions as Wells Fargo. Director Bair of the FDIC answered "No", that it was a private contract, and that the FDIC didn't have the role to help Citi in a bidding war. She furthermore doubted whether Citi could pay \$ 7 a share.

The deal was published the same Friday morning. It would come into effect midnight 31/12/08. The press release stressed that the government or government money were not involved in the contract.³⁹⁴

The following is from the Wiki page about John M. Reich, director of OTS:

«Under Director Reich, the Office of Thrift Supervision saw the failure or near-failure of at least five major institutions - IndyMac Bank, AIG, Washington Mutual, Downey Financial and Countrywide Financial. These constituted some of the largest financial failures in modern history to that point. OTS later acknowledged that in the case of AIG it failed to take regulatory actions it should appropriately have taken as early as 2004. In the case of IndyMac, after Director Reich and OTS both denied responsibility for the failure, the Office of Inspector General of the United States Treasury found that OTS both inappropriately failed to act and inappropriately and knowingly allowed regulatory misconduct.»³⁹⁵

The end of September and October 2008.

At the end of September the existing legal instruments of the Fed to provide support were exhausted. Saturday 20/9/08 Treasury secretary Paulson sent a proposal of three pages to Congress for a Troubled Asset Relief Program (TARP). It would provide «authority for the Federal Government to purchase and insure certain types of troubled [“toxic”] assets for the purposes of providing stability to and preventing disruption in the economy and financial system and protecting taxpayers»³⁹⁶ to an amount of B\$ 700. For the supervision of the program a Congressional Oversight Panel and an Office of the Special Inspector General for the Troubled Asset Relief Program (SIGTARP) would be installed. Monday 29/9/08 the proposal was rejected by the House of representatives. It was adjusted and expanded to 169 pages. It was approved by Congress, and signed into law by president G.W. Bush on Friday 3/10/08.

But the markets deteriorated further. «In response, on October 7, the Fed created yet another emergency program, the Commercial Paper Funding Facility, to purchase secured and unsecured

³⁹³ FCIC report p. 367/95.

³⁹⁴ FCIC report, section 20.5, pp. 366/94 and following. The preceding text in the FCIC report shows that this is at best a half truth, even in the case most advantageous for Bair. For tax measures are equivalent with support or impediment.

³⁹⁵ Wiki page of 20130207, in the directory USA/OTS.

³⁹⁶ FCIC report p. 372/400.

commercial paper directly from eligible issuers. This program, which allowed firms to roll over their debt, would be widely used by financial and nonfinancial firms.» Including foreign banks such as UBS and Dexia, and companies like Toyota and McDonald's.³⁹⁷

The misery was not restricted to the USA. In Europe too, institutions had invested in MBS. Share prices were falling everywhere. In the beginning of October they seemed to get into a free fall. They lost 20% in a single week. To slow down this development, or to reverse it, the most important central banks, the Bank of Canada, the Bank of England, the ECB, the Federal Reserve, the Swedish Riksbank and the Swiss National Bank, on 8/10/08 lowered the discount rate.

«The action prompted a worldwide stock rally, with the Dow rising 936 points, or 11 percent, on October 13. But as the prospect of a severe global recession became more evident, such gains were impossible to sustain. Just two days later, after Ben S. Bernanke, the Federal Reserve chairman, said there would be no quick economic turnaround even with the government's intervention, the Dow plunged 733 points.»³⁹⁸

It would go on like this until March 2009.

8/10/08. «The UK government launches a £400 billion rescue plan to help restore confidence in the financial markets. The three-pronged plan included:

- 1) the government investing as much as £50 billion in the banking industry,
- 2) guaranteeing as much as £250 billion of new bank debt, and
- 3) adding £100 billion to the existing Bank of England short-term loan scheme.»³⁹⁹

On 29/10/08 the US Fed lowered its discount rate from 1.5% to 1%. In November the ECB and Bank of England followed suit, and further lowered their rates as well.⁴⁰⁰

The US government was working on a proposal for support of home owners in difficulties, and of banks which were willing to reduce the monthly mortgage costs of such home owners.

The above shows that in the USA there were several or even many governmental emergency programs. On pp. 375-6/403-4 of its report the FCIC gives some numbers:

«The Fed's TSLF and PDCF programs peaked at \$483 billion and \$156 billion, respectively. Its money market funding peaked at \$350 billion in January 2009, and its Commercial Paper Funding Facility peaked at \$365 billion, also in January 2009. When it was introduced, the FDIC's program to guarantee senior debt for all FDIC-insured institutions stood ready to backstop as much as \$939 billion in bank debt. The Fed's largest program, announced in November 2008, purchased \$1.25 trillion in agency mortgage-backed securities.»

November 2008 - January 2009.

On 10/11/08 the remaining problems of AIG were solved using TARP:

«[...] the government announced that it was restructuring the New York Fed loan and, in the process, Treasury would purchase \$ 40 billion in AIG preferred stock. As was done in the Capital Purchase Program, in return for the equity provided, Treasury received stock warrants from AIG and imposed restrictions on dividends and executive compensation.»⁴⁰¹

Afterwards, the operation was criticized by the TARP-supervisor:

«In June 2010, TARP's Congressional Oversight Panel criticized the AIG bailout [by the NY Fed] for having a “poisonous” effect on capital markets. The report said the government's failure to require

⁴⁰⁰ The ECB from 3,75 to 3,25%, and the BoE from 4,5 to 3%. Source: inverse timeline of Chunlin Liu.

⁴⁰¹ FCIC report p. 376/404.

“shared sacrifice” among AIG’s creditors effectively altered the relationship between the government and the markets, signaling an implicit “too big to fail” guarantee for certain firms. The report said the New York Fed should have insisted on concessions from counterparties.

Treasury and Fed officials countered that concessions would have led to an instant ratings downgrade and precipitated a run on AIG.⁴⁰² New York Fed officials told the FCIC that they had very little bargaining power with counterparties who were protected by the terms of their CDS contracts.⁴⁰³ And, after providing a \$85 billion loan, the government could not let AIG fail. “Counterparties said ‘we got the collateral, the contractual rights, you’ve been rescued by the Fed, Uncle Sam’s behind you, why would we let you out of a contract you agreed to?’”⁴⁰⁴

About the costs for the tax payer the FCIC remarks:

«In total, the Fed and Treasury had made available over \$180 billion in assistance to AIG to prevent its failure. As of September 30, 2010, the total outstanding assistance has been reduced to \$124.8 billion, primarily through the sale of AIG business units»⁴⁰⁵

After the failure of the Wachovia deal, the price of Citigroup shares had fallen 60%. It asked the Fed for more loans. The Fed refused because it feared that the money would vanish as soon as provided. Instead «Treasury agreed [Sunday 23/11/08] to provide Citigroup with an additional \$20 billion in TARP funds in exchange for preferred stock with an 8% dividend. This injection of cash brought the company’s TARP tab to \$45 billion. The bank also received \$19.5 billion in capital benefits related to its issuance of preferred stock and the government’s guarantee of certain assets.»⁴⁰⁶

At a meeting of the FDIC board the same Sunday 10:00 PM OTS director John Reich expressed doubts about the consistency of the intervention(s). Were similar remedies applied in similar cases? Were the same norms applied to decide if there was a systemic risk? Whatever the answers, the FDIC approved the proposal.

About the follow up the FCIC reports: [In] «December 2009 [...] Citigroup terminated the government guarantee in tandem with repaying \$20 billion in TARP funds. In December 2010, Treasury announced the sale of its final shares of Citigroup’s common stock.»⁴⁰⁷

Bank of America was seen as the next domino. In October 2007 it had taken over Countrywide. On 15/9/08 it had announced that it would take over Merrill Lynch. But only per 1/1/09, and after approval by supervisors and shareholders. The Fed approved the take over on 26/11/08, the shareholders on 5/12/08.

But BofA started to get doubts because the losses of Merrill “accelerated pretty dramatically”, in the words of CEO Ken Lewis of BofA. He said they had known the assets, but had not expected their value to drop so fast.

«Merrill’s [CEO] Thain contests that version of events. He told the FCIC that Merrill provided daily profit and loss reports to Bank of America and that bank executives should have known about losses as they occurred. The SEC later brought an enforcement action against Bank of America, charging the company with failing to disclose about \$9.5 billion of known and expected Merrill Lynch losses before the December 5 shareholder vote. According to the SEC’s complaint, these insufficient disclosures deprived shareholders of material information that was critical to their ability to fairly evaluate the merger. In February 2010, Bank of America would pay \$150 million to settle the SEC’s action».⁴⁰⁸

On 15/12/08 Lewis told Paulson that he wanted to invoke the “material adverse change” clause in the agreement which permitted exit or renegotiation. Paulson and Bernanke asked time to consider. They concluded that everyone concerned would be hurt by putting the clause into effect, and that it would cause a systemic risk. They furthermore thought that legal action would fail. Sunday 21/12/08

⁴⁰² At great costs to the counterparties. So the argument is weak at best.

⁴⁰³ This too is debatable: Non-existing money cannot be paid.

⁴⁰⁶ FCIC report p. 381/409.

⁴⁰⁷ FCIC report p. 382/410.

⁴⁰⁸ FCIC report p. 383/411. Note that this money goes to the SEC, not to the shareholders.

Paulson informed Lewis. He also told him «that the Fed, as its [= BofA's] regulator, had the legal authority to replace Bank of America's management and board if they embarked on a “destructive” strategy that had “no reasonable legal basis.”»⁴⁰⁹

In spite of the support already given, the risks for BofA remained significant. Every night BofA rolled over more than B\$ 500. Downgrades and relatively small collateral calls could easily cause liquidity problems. Treasury, Fed and FDIC therefore decided upon an arrangement similar to that for Citigroup. Once again the FDIC invoked the systemic risk exception. Namely on 15/1/09, in time for BofA's announcement of a net loss of B\$ 15.3 by Merrill due to real estate related write-downs en charges. The government arrangement was announced at the same time. The price of BofA shares nevertheless dropped 14%.

On 6/5/09 BofA requested termination of the “ring fence (protection) deal”, which was part of the arrangement. This was granted, conditional upon payment of M\$ 425 «for the benefits it had received from the market's perception that the government would insure its assets.»⁴¹⁰

9/11/08. «China announced a £373bn [B\$ 586] economic stimulus package to boost its economy». ⁴¹¹

On 16/12/08 the Fed lowered its discount rate from 1% to a range of 0-0.25%.⁴¹²

In 2008 unemployment in the USA increased to 7.2%. Before the crisis it was 4.4%.⁴¹³

In 2008 the S&P 500 lost 41% (in 1931 47%), the Nikkei 225 42%, and the FTSE Eurofirst 300 45%.⁴¹⁴

⁴¹⁵ Yahoo, 27/5/13.

As from here, the chronicle has a somewhat different character. The remainder of the chronicle is more impressionistic. It adds support for the hypothesis of the structural character of phenomena. But it is not strictly necessary for the analysis and explanation, and for the substantiation of the conclusions and measures. It wants to:

- Give an impression of the consequences of the earlier events;
- Show that the crisis is far from over;
- Give an impression of the actions of governments and supervisors (too late, many, and of dubious quality);
- Give an impression of the mental climate of the times.

Someone who is mainly interested in causes and lessons of the crisis may skip the remainder and jump to the Analysis.

January 2009.

8/1/09. The Bank of England lowers the discount rate to 1.5%. It has not been this small for 300 years.

9/1/09. The German government takes an interest of 25% in Commerzbank, to prevent bankruptcy due to liquidity shortage.

14/1/09. The Greek government debt is downgraded by S&P.

15/1/09. The Irish government nationalizes the Anglo Irish Bank.

16/1/09. The ECB lowers the discount rate with 0.5 percentage points to 2%.

19/1/08. The UK government announces a plan for support of the banking sector.

20/1/09. Spain loses its AAA rating of S&P.

26/1/09. President Obama appoints T.F. Geithner, till then chairman of the NY Fed, secretary of the Treasury.

29/1/09. «The US House of Representatives has passed President Barack Obama's US\$ 819 bn economic stimulus package. The bill would cut taxes for people and businesses by US\$ 275 bn, while pumping more than US\$ 540 bn into a range of initiatives including road and bridge repair, increased unemployment benefits, investment in new technology and renovations to 10,000 schools.»⁴¹⁶

February 2009.

5/2/09. The Bank of England lowers the discount rate from 1,5 to 1%.

The value of the Chinese export of February 2009 was 28% less than that of February 2008.⁴¹⁷

March 2009.

2/3/09. «American Insurance Group (AIG) announces a \$61.7 billion loss in the fourth quarter of 2008, the largest in US corporate history. The US Treasury Department and the Federal Reserve announced a restructuring of the government's assistance to AIG in order to stabilize the company and enhance its capital and liquidity.»⁴¹⁸

5/3/09. The «Bank of England announced that it would undertake a policy of “quantitative easing”. The Bank will purchase £75 billion of assets using money which it will create. The aim is to boost the economy and prevent inflation undershooting its 2% target. This is accompanied by a further interest rate [decrease] to 0.5% (from 1.0%). Although the 0.5% rate is the floor for UK interest rates in the crisis, the level of quantitative easing is increased during the subsequent months.

⁴¹⁶ Inverse timeline of Chunlin Liu.

The ECB cuts interest rates to 1.5% from 2%.»⁴¹⁹

6/3/08. «The Bank of England (BoE) has created £75bn of new money to pump into the economy over the next three months. The BoE conceded that it had run out of options on interest rates after cutting rates as close to zero as possible and needed to take additional unorthodox measures to prevent a slide into deflation.»⁴²⁰

13/3/09. «On US television programme The Daily Show, host Jon Stewart lambasts CNBC's Jim Cramer and the network itself for not alerting investors and viewers to the financial crisis. "You knew what the banks were doing, and yet were touting it for months and months," Stewart said. "The entire network was. And so now to pretend that this was some sort of crazy, once-in-a-lifetime tsunami that nobody could have seen coming is disingenuous at best and criminal at worst."»⁴²¹

In the first half of March 2009 the most important US indexes of share prices, such as the Dow Jones Industrial Average and the S&P 500, reached their lowest level of the period 2000-2015. In other words: as from March 2009 they started to climb. Though with substantial interruptions. The approximate date of the minimum may be related to the publication of operating results of publicly traded companies for 2008 and the last quarter of 2008. In general, these numbers become known in February.

«18 March 2009: the Fed steps up its policy of "credit easing" similar to the quantitative easing employed by the Bank of England: "to help improve conditions in private credit markets, the Committee decided to purchase up to \$300 billion of longer-term Treasury securities over the next six months." This is in addition to the \$1.25bn of mortgage-backed securities and \$200bn of agency debt that has been, and will be, purchased in 2009.»⁴²²

19/3/09. «The US Federal Reserve announced plans to buy US\$300bn of US government debt, triggering a plunge in bond yields and the dollar. The US central bank also said it was more than doubling its purchases of securities issued by Fannie Mae and Freddie Mac to US\$1,450bn. It said it now expected to keep interest rates near zero for an 'extended period' of time.

The [UK] Financial Services Authority announced a sweeping overhaul of the UK's financial regulatory regime, marking a break with its previous 'light-touch' approach and attempting to set a new global standard for the post-crisis world. Chairman Lord Turner set out plans to curb banks' ability to take excessive risks by forcing them to hold more capital and increase their holdings of liquid assets and cash.»⁴²³

«23 March 2009: the US Treasury announces details of the public-private bank purchase of toxic loans and securities. Using \$75-100bn of TARP funds, the Treasury will invest in the purchase of toxic assets that remain difficult to sell on the market. Reducing risk to encourage private investment, the Fed will make available low-interest loans for purchasing securities while the FDIC will offer guarantees against losses on loans. The Treasury hopes the [Federal Reserve] bank will initially make \$500bn of purchases, potentially rising to \$1tr; profits will be shared equally by the Treasury and private sector.

26 March 2009: US Treasury unveils plans for a new regulatory framework. The framework details four components of regulatory reform: addressing systemic risk, protecting consumers and investors,

⁴¹⁹ Timeline UK House of Commons. Note that even though the facts had by now shown beyond any doubt that regulation and supervision had been completely inadequate for more than a decade, the people who had always claimed that the financial system was as sound as can be believed when they say that an inflation of 2% serves the general welfare.

⁴²⁰ Inverse timeline of Chunlin Liu.

⁴²¹ Inverse timeline of Chunlin Liu. If Jim Cramer really saw things, and should have done something about it, why not the government and supervisors? Why doesn't Jon Stewart say anything like this?

⁴²² Timeline UK House of Commons p. 31.

⁴⁴¹ P. 27/28, Reinhart & Rogoff *From Financial Crash to Debt Crisis*. In the directory Encyclopaedia under 20100303.

⁴⁴² Definition of “net government debt”: Net financial liabilities are defined as the gross financial liabilities of the general government sector less the financial assets of the general government sector. Such assets may be cash, bank deposits, loans to the private sector, participation in private sector companies, holdings in public corporations or foreign exchange reserves, depending on the institutional structure of the country concerned and data availability.

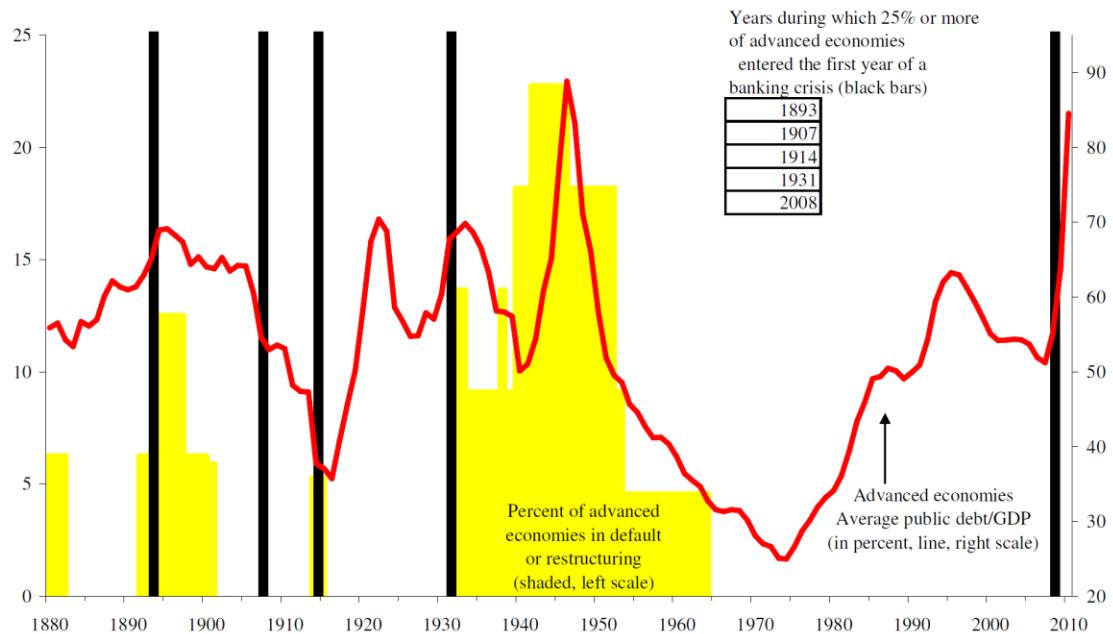

Definition of “gross government debt”: Gross financial liabilities are defined as the debt and other liabilities (short and long-term) of all the institutions in the general government sector, defined by ESA95/SNA93 (ESA= European standardized accounts; SNA= system of national accounts), subject to data availability. For the United States, Flow of Funds estimates are used, which value debt at face value. The gross data are consolidated within and between the sub-sectors of the general government sector, national sources permitting.

The status and treatment of government liabilities in respect of their employee pension plans in the national accounts have been diverse across countries, making international comparability of government debts difficult. The current interpretation of the 1993 SNA is that: i) “autonomous” funded pension plans should be classified outside the general government sector, which entails that their assets and liabilities are not reflected in the general government debt data; ii) non-autonomous pension plans should be classified inside the general government sector and only the funded component should be reflected in the general government liabilities. Furthermore, the 1993 SNA recommends that the liability inherent in unfunded schemes be recorded as a

further to over 100% (net 66%).⁴⁴³ In spending more than their income, governments take an unknown but in principle large risk.⁴⁴⁴ They make themselves dependent on the capital market (or specific lenders) and interest rates. Because government expenditure is specified by law, deficits are illegal. Even if they are approved after the fact. But apart from their legitimacy it is obvious that they cannot increase indefinitely. The only question is when and how things will go wrong.

«In April [2009], the EU orders France, Spain, the Irish Republic and Greece to reduce their budget deficits - the difference between their spending and tax receipts.»⁴⁴⁵

FIGURE 14. Sovereign Default on External Debt, Total (domestic plus external) Public Debt, and Systemic Banking Crises: Advanced Economies, 1880-2010
(debt as a percent of GDP)

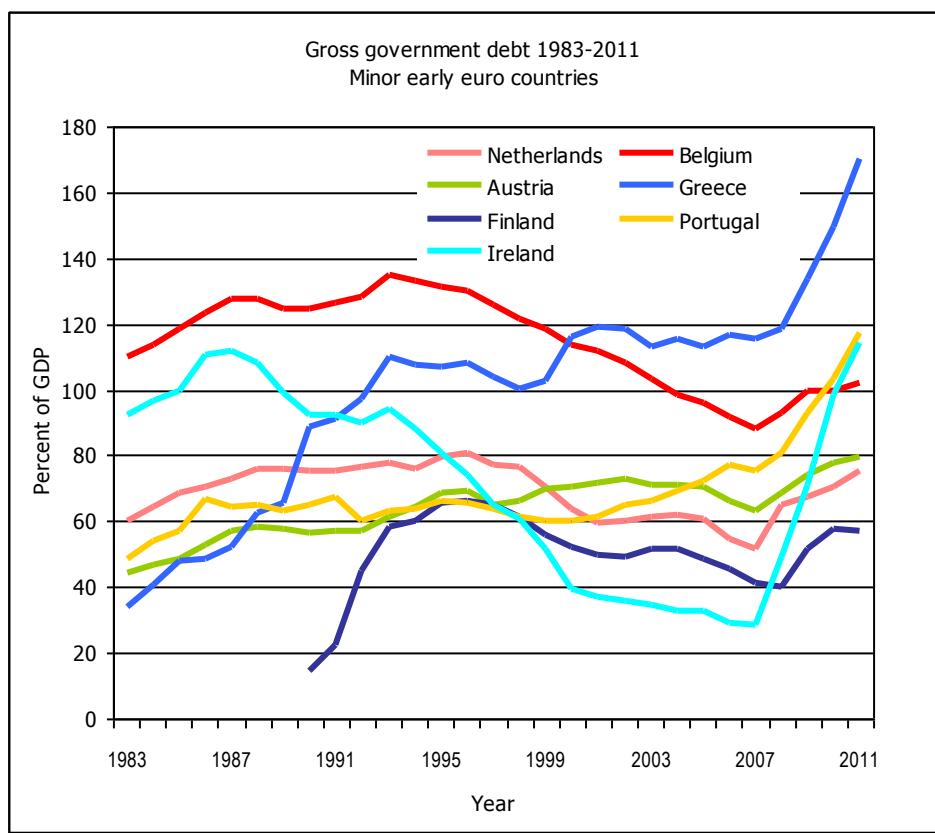

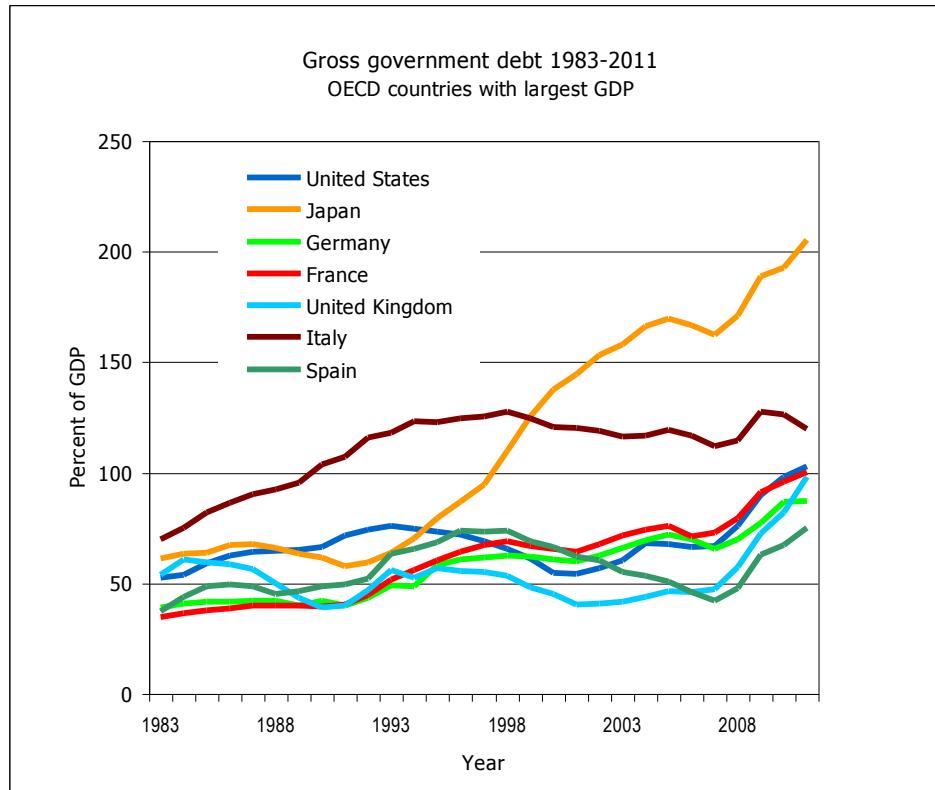

memorandum item for the government sector. However, while some countries have produced some estimates of these implicit liabilities, few follow the 1993 SNA recommendation.

Source of this footnote: the web page *Notes to statistical annex tables 25-33* of *OECD Sources and Methods*. Only available at the OECD website. The page can be found in the directory OECD, under 20130521.

⁴⁴³ The data about government debt come from tables 32 and 33 in the Annex Tables of the *OECD Economic Outlook*. There one can also find the relevant definitions.

⁴⁴⁴ “Large” could and should probably be defined more or less quantitatively, say in terms of unemployment and/or loss of income of certain groups of citizens, but for the present the example of Greece may suffice.

⁴⁴⁵ BBC News Timeline Eurozone Crisis. (Webpage of 19/4/12).

May 2009.

1/5/09. «Regulators seize Silverton Bank of Atlanta, a bank which provided services to other

banks. This is the largest bank failure so far in 2009, with \$4.1 billion assets.»⁴⁴⁶

8/5/09. «The European Central Bank announces that it would lower its main refinancing rate to 1% and continue to provide unlimited short-term and longer-term liquidity to the market for at least a further 12 months. The ECB also announced its intention to purchase €60bn of euro-denominated covered bonds (a particularly safe form of asset-backed security) from primary and secondary markets.»⁴⁴⁷

3/5/09. «East Asia announces plans to create a \$120 million emergency fund to help the countries withstand the global financial crisis. Japan and China will provide 32% of the funds, South Korea 16%, and the remaining amount to be contributed by the Association of South East Asian Nations (ASEAN).»⁴⁴⁸

4/5/09. In the first quarter of 2009 the demand for mortgages in the USA increased for the first time since the beginning of 2007.⁴⁴⁹

5/5/09. «Japan has offered US\$100bn in financial assistance to Asian countries hit by the global financial crisis. Tokyo announced at a meeting of the finance ministers of the 10 countries of the Association of South-East Asian Nations in Indonesia that it would set up a Y6,000bn (US\$61.5bn) bilateral currency swap scheme, on top of a US\$38.4bn commitment to the multilateral Chiang Mai initiative. The Chiang Mai deal, a \$120bn currency scheme that has been under discussion for years, was formally agreed by the Asean countries at a meeting with the finance ministers of Japan, China and South Korea.»⁴⁵⁰

13/5/09. «U.S. Treasury releases proposals to regulate OTC derivatives. Aims include amending the Commodity Exchange Act (CEA) to include larger margin requirements and stronger risk controls as well as increased authority to police fraud and manipulation.»⁴⁵¹

15/5/09. «The economies of the 16 countries that make up the eurozone declined by 2.5% in the first three months of 2009, the EU's statistics agency Eurostat said. A sharp fall in German exports was a key factor in the decline.»⁴⁵²

20/5/09. «Japan's economy shrank a record 4% in the first quarter as companies slashed investment and exports. This is the quickest drop since records began in 1955.»⁴⁵³

«In the wake of the most significant financial crisis since the Great Depression, the [U.S.] President [Obama] signed into law on May 20, 2009, the Fraud Enforcement and Recovery Act of 2009, creating the Financial Crisis Inquiry Commission [FCIC]. The Commission was established to "examine the causes, domestic and global, of the current financial and economic crisis in the United States."

The 10 members of the bi-partisan Commission, prominent private citizens with significant experience in banking, market regulation, taxation, finance, economics, housing, and consumer protection, were appointed by Congress on July 15, 2009. The Chair, Phil Angelides, and Vice Chair, Bill Thomas, were selected jointly by the House and Senate Majority and Minority Leadership.

The FCIC is charged with conducting a comprehensive examination of 22 specific and substantive areas of inquiry related to the financial crisis. These include:

- fraud and abuse in the financial sector, including fraud and abuse towards consumers in the mortgage sector;
- Federal and State financial regulators, including the extent to which they enforced, or failed to enforce statutory, regulatory, or supervisory requirements;

⁴⁴⁶ Timeline University of Iowa. The “which” replaces “who” in the original.

⁴⁴⁷ Timeline UK House of Commons p. 32.

⁴⁴⁸ Timeline University of Iowa. The “East Asia” is not defined or specified. By mentioning “\$120bn”, the entry for 5/5/09 below suggests that it refers to ASEAN.

⁴⁴⁹ Timeline University of Iowa.

⁴⁵⁰ Inverse timeline of Chunlin Liu. The relation with the previous statement is not fully clear. Alternative sources could not be found. The information has been included to show that and how the crisis affected Asia, and that Asian countries also took internationally coordinated measures.

⁴⁵¹ Timeline University of Iowa. Remember that in 1998/1999 only the proposal to discuss regulation of OTC already cost Brooksley Born her CFTC job.

⁴⁵² Inverse timeline of Chunlin Liu.

⁴⁵³ Inverse timeline of Chunlin Liu.

- the global imbalance of savings, international capital flows, and fiscal imbalances of various governments;
- monetary policy and the availability and terms of credit;
- accounting practices, including, mark-to-market and fair value rules, and treatment of off-balance sheet vehicles;
- tax treatment of financial products and investments;
- capital requirements and regulations on leverage and liquidity, including the capital structures of regulated and non-regulated financial entities;
- credit rating agencies in the financial system, including, reliance on credit ratings by financial institutions and Federal financial regulators, the use of credit ratings in financial regulation, and the use of credit ratings in the securitization markets;
- lending practices and securitization, including the originate-to-distribute model for extending credit and transferring risk;
- affiliations between insured depository institutions and securities, insurance, and other types of nonbanking companies;
- the concept that certain institutions are 'too-big-to-fail' and its impact on market expectations;
- corporate governance, including the impact of company conversions from partnerships to corporations;
- compensation structures;
- changes in compensation for employees of financial companies, as compared to compensation for others with similar skill sets in the labor market;
- the legal and regulatory structure of the United States housing market;
- derivatives and unregulated financial products and practices, including credit default swaps;
- short-selling;
- financial institution reliance on numerical models, including risk models and credit ratings;
- the legal and regulatory structure governing financial institutions, including the extent to which the structure creates the opportunity for financial institutions to engage in regulatory arbitrage;
- the legal and regulatory structure governing investor and mortgagor protection;
- financial institutions and government-sponsored enterprises; and
- the quality of due diligence undertaken by financial institutions;

The Commission is called upon to examine the causes of major financial institutions which failed, or were likely to have failed, had they not received exceptional government assistance.

In its work, the Commission is authorized to hold hearings; issue subpoenas either for witness testimony or documents; and refer to the Attorney General or the appropriate state Attorney General any person who may have violated U.S. law in relation to the financial crisis.

On November 17, 2010 the Commission resolved, by majority vote, to deliver its report in January 2011, rather than on December 15, 2010. The Commission will conclude its operations by February 13, 2011, as prescribed.»⁴⁵⁴

29/5/09. «Standard and Poor's downgraded its view of the UK to 'negative' from 'stable' for the first time since it started analyzing its public finances in 1978. It said the UK's finances were deteriorating faster than expected. The change came as data confirmed that new government borrowing has soared, to a record of almost £8.5bn in April. [...]

Japan's factory output has jumped at its fastest rate in more than 50 years, but higher unemployment figures have dampened hope of an early recovery. Output rose by 5.2% in April from the previous month, the biggest monthly gain since 1953, official figures show. The jobless rate hit 5% in April, up from 4.8% in March.

India's economy grew 5.8% in the first three months of the year compared with the same period last

⁴⁵⁴ Announcement on the FCIC website 17/12/10. The law referred to can be found under 20090520 in the directory FCIC.

year, which was better than had been expected. The official gross domestic product figure was down from 8.6% annual growth seen in the first quarter of 2008.»⁴⁵⁵

June 2009.

1/6/09. «The US economy shrank in the first three months of 2009 at a slower pace than had originally been estimated by the Commerce Department. Gross domestic product (GDP) declined by an annual rate of 5.7% in the first quarter, less than the 6.1% that had been estimated in April.»⁴⁵⁶

2/6/09. «Stock markets in emerging economies are experiencing a strong resurgence. Since its March 2009 low, the MSCI emerging markets index has gained 68 percent, compared with a 43 percent gain in the developed markets index.»⁴⁵⁷

3/6/09. «U.S. banks generate more capital than required by regulators, selling common stock and nonguaranteed debt to raise more than \$85 billion since May 7. Mutual funds and other large institutional investors are buying aggressively and stock prices reflect the improving climate. Bank of America shares are up 263 percent from their March low, JP Morgan is up 118 percent.»⁴⁵⁸

4/6/09. «The Bank of England maintains its headline interest rate at 0.5%, and votes to continue with its asset purchase facility.»⁴⁵⁹

In a report “Cost of Freddie Mac’s Affordable Housing Mission” of 4/6/09, submitted to the Business Risk Committee of the Board of Directors of Freddie Mac one can read the following:

- «Our housing goals compliance required little direct subsidy prior to 2003, but since then subsidies have averaged \$200 million per year.
- Higher credit risk mortgages disproportionately tend to be goal-qualifying.
- Targeted affordable lending generally requires ‘accepting’ substantially higher credit risk.
- We charge more for targeted (and baseline) affordable single-family loans, but not enough to fully offset their higher incremental risk.
- Goal-qualifying single-family loans accounted for the disproportionate share of our 2008 realized losses that was predicted by our models.
- In 2007 Freddie Mac failed two subgoals, but compliance was subsequently deemed infeasible by the regulator due to economic conditions. In 2008 Freddie Mac failed six goals and subgoals, five of which were deemed infeasible. No enforcement action was taken regarding the sixth missed goal because of our financial condition.
- Goal-qualifying loans tend to be higher risk. Lower household income correlates with various risk factors such as less wealth, less employment stability, higher loan-to-value ratios, or lower credit scores.
- Targeted affordable loans have much higher expected default probabilities... Over one-half of targeted affordable loans have higher expected default probabilities than the highest 5% of non-goal-qualifying loans.»⁴⁶⁰

10/6/09. «10 banks are allowed to exit the U.S. TARP program. The first to exit include American Express, Goldman Sachs, Morgan Stanley and JPMorgan Chase. Combined, they will return \$68.3 billion, more than a quarter of the federal bailout money issued by TARP since October 2008.»⁴⁶¹

17/6/09. «BRIC country leaders (from Brazil, Russia, India and China) convene in Yekaterinburg, Russia for [a] one-day summit. BRIC countries account for 40 percent of the world’s population and 15 percent of its economy. The BRIC countries seek a greater voice in the global economy and a more diversified approach to its management, voicing criticism of the U.S. dollar’s role as reserve currency and calling for comprehensive reform of the United Nations. BRIC leaders mean to “send a message

to Washington” about the economic interests and representation of emerging economies.»⁴⁶²

18/6/09. «President Obama reveals a dramatic overhaul of way [sic] the U.S. government oversees financial markets. The sweeping changes, criticized by some as too hasty, aim to promote innovation while discouraging abuse. They propose:

For the Supervision of Financial Institutions

- A new Financial Services Oversight Council of financial regulators to identify emerging systemic risks and improve interagency cooperation.
- New authority for the Federal Reserve to supervise all firms that could pose a threat to financial stability, even those that do not own banks.
- Stronger capital and other prudential standards for all financial firms, and even higher standards for large, interconnected firms.
- A new National Bank Supervisor to supervise all federally chartered banks.
- Elimination of the federal thrift charter and other loopholes that allowed some depository institutions to avoid bank holding company regulation by the Federal Reserve.
- The registration of advisers of hedge funds and other private pools of capital with the SEC.

For the Regulation of Financial Markets

- Enhanced regulation of securitization markets, including new requirements for market transparency, stronger regulation of credit rating agencies, and a requirement that issuers and originators retain a financial interest in securitized loans.
- Comprehensive regulation of all over-the-counter derivatives.
- New authority for the Federal Reserve to oversee payment, clearing, and settlement systems.

For Consumer Protection

- A new Consumer Financial Protection Agency to protect consumers across the financial sector from unfair, deceptive, and abusive practices.
- Stronger regulations to improve the transparency, fairness, and appropriateness of consumer and investor products and services.
- A level playing field and higher standards for providers of consumer financial products and services, whether or not they are part of a bank.

For Government Management of Financial Crisis

- A new regime to resolve nonbank financial institutions whose failure could have serious systemic effects.
- Revisions to the Federal Reserve’s emergency lending authority to improve accountability.

For Improved International Regulatory Standards and Cooperation

- International reforms to support our efforts at home, including strengthening the capital framework; improving oversight of global financial markets; coordinating supervision of internationally active firms; and enhancing crisis management tools.

Treasury Secretary Tim Geithner will chair the administration’s planned “council of regulators”. The Council, composed of eight heads of the top regulation organizations, would co-ordinate policy and advise the Federal Reserve on emerging risks.»⁴⁶³

23/6/09. «On June 23, 2009, the Tweede Kamer [the second of the two chambers of Dutch parliament] unanimously approved a proposal of its Presidium to charge a temporary parliamentary commission with an inquiry into the crisis of the financial system. The same day the Temporary

⁴⁶² Timeline University of Iowa.

⁴⁶³ Timeline University of Iowa. Its sources are websites. The text very much looks like political propaganda. It may be quoted from a press release. Note the “our” under the last dot. As will be seen in the Analysis, most (if not all) of the proposals are unnecessary, and the real causes of the crisis are not addressed. As is underlined by the fact that Geithner had been head of the NY Fed for many crucial years.

Commission Inquiry Financial System is installed.»⁴⁶⁴

«The Tweede Kamer approved a proposal stating that the purpose of the inquiry is to make a contribution to adequate operation of the financial system in general and in the Netherlands in particular. On this basis the inquiry proposal specifies two central questions:

“What are the causes of the recent turbulent developments in the financial system, and what recommendations can be made on the basis of the findings of the inquiry for a more adequate operation of the financial system?”»⁴⁶⁵

In the present report, the Temporary Commission Inquiry Financial System is called after its chairman, Jan de Wit: Commission De Wit, or CDW.

25/6/09. «Bank of England’s six monthly *Financial Stability Report* noted that “market sentiment has improved in recent months ... Perceptions of banks’ resilience have improved ... Market contacts report somewhat better conditions in funding markets, with signs that creditors are willing to provide finance without government guarantees, though term funding in unsecured money markets remains constrained. Notwithstanding these positive developments, balance sheets of banks internationally remain weak ... As long as these balance sheet vulnerabilities persist, there is a risk to the banking system from further adverse economic or financial sector developments, which could in turn affect lending and economic recovery”.»⁴⁶⁶

29/6/09. «Spiralling government debt around the world has prompted the creation of the first tradeable indices tracking the risks of countries defaulting. Markit, the data provider, has launched four indices of credit default swaps (CDSs)- used as insurance against bond defaults- as investors demand more information about the dangers of the growing debt mountain. These will run alongside CDS for individual countries, which are already traded.»⁴⁶⁷

July 2009.

2/7/09. The UK GDP of the first quarter of 2009 was 2.4% less than that of the corresponding quarter of 2008.⁴⁶⁸

7/7/09. «The worst of the UK's recession is over, according to the British Chambers of Commerce (BCC) business group. A BCC report that surveyed 5,600 companies found that there had been 'welcome progress' in confidence levels between April and June 2009. However, the BCC still expects unemployment in the UK to reach 3.2 million by 2010.»⁴⁶⁹

15/7/09. «UK unemployment rose by a record 281,000 to 2.38 million, in the three months to May, the Office for National Statistics has said. The jobless rate increased to 7.6%, the highest in more than 10 years.»⁴⁷⁰

16/7/09. «China's economy accelerated significantly in the second quarter, with gross domestic product expanding by 7.9%, ahead of analysts' consensus estimates. The surge in growth was driven by the government's aggressively loose fiscal and monetary policies, introduced late last year, with most of the funding coming from record lending by state banks.»⁴⁷¹

August 2009.

6/8/09. «The Bank of England increases its quantitative easing by a further £50 billion to £175 billion, while maintaining interest rates at 0.5%.»⁴⁷²

⁴⁶⁴ CDW1 p. 28/24.

⁴⁷² Timeline UK House of Commons p. 33. As a reminder: quantitative easing is the printing and distribution of money by the central bank. It brings money in circulation by buying threatened securities (that is: other kinds of printed paper representing contracts).

November 2009.

25/11/09. «The Chancellor tells the House that the Bank of England provided liquidity to Halifax Bank of Scotland and Royal Bank of Scotland from October 2008. The support provided peaked at £36.6 billion for RBS (17 October 2008) and £25.4 billion for HBOS (13 November 2008), and in return the banks deposited collateral at the Bank of England and were charged fees. *The Financial Times* reported that “although Lloyds shareholders were told [during the acquisition process] HBOS would have to ‘substantially rely for the foreseeable future’ on Bank of England liquidity support, they found out only the extent of the stricken bank’s problems” when the Chancellor made his statement to the House. The Chancellor said “there has been no cost to the taxpayer”, and added that the Treasury had provided an indemnity to the Bank in respect of its liquidity operations.»⁴⁷³

December 2009.

In October Greece got a new government. In December the new government announced that the debt of the Greek government was much larger than the preceding government, of Kostas Karamanlis, had said. According to the OECD’s *Economic Outlook* 2011-1, in 2009 the debt was net 101% and gross 132% of GDP.⁴⁷⁴

In *Credit Crisis- The Essentials Overview*, The New York Times writes:

«[...] by the year’s end, many big banks were reporting large profits and all but one had repaid or were in the process of returning their bailout money to the federal government. But many businesses, especially small ones, reported that credit was still tight and only a fraction of those homeowners the Obama administration had hoped to help with a \$75 billion foreclosure prevention program had reached agreements with their banks. Unemployment rose steadily all year to the highest levels seen in a generation, and anger over the crisis, the banks, the bailout and new rounds of large bonuses became a potent force in politics.»⁴⁷⁵

2010.

January 2010.

HUD publishes a *Report to Congress on the Root Causes of the Foreclosure Crisis*. It asserts that the pursuit of gain is the moving force behind the crisis:

«[...] the sharp rise in mortgage delinquencies and foreclosures is fundamentally the result of rapid growth in loans with a high risk of default- due both to the terms of these loans and to loosening underwriting controls and standards. Mortgage industry participants appear to have been drawn to encourage borrowers to take on these riskier loans due to the high profits associated with originating these loans and packaging them for sale to investors»⁴⁷⁶

The high profits are an invention of HUD, as witnessed by for example annual reports of Fannie and Freddie, the report *Cost of Freddie Mac’s Affordable Housing Mission*⁴⁷⁷, and of course, the perceived need to place them in receivership. The annual reports point to the relatively low profits and relatively high costs and risks of mortgages bought to comply with the AH-goals. That is: HUD policy. Risks (and costs) which were realized in the crisis.

As seen in the chronicle of the years preceding the crisis, the “mortgage industry participants” were not “drawn” to encourage borrowers to take on riskier loans, but (strongly) pushed.

«In January, an EU report condemns “severe irregularities” in Greek accounting procedures.

⁴⁷³ Timeline UK House of Commons p. 33. The rectangular brackets are from the original.

⁴⁷⁶ Quoted by Pinto on p. 155.

⁴⁷⁷ Mentioned under 4/6/09.

Greece's budget deficit in 2009 is revised upwards to 12.7%, from 3.7%, and more than four times the maximum [of 3%] allowed by EU rules.»⁴⁷⁸

April 2010.

«8 April 2010: the difference (or “spread”) between yields of Greek government bonds over their German equivalent (Bunds) hit the highest point since Greece joined the European single currency. The spread was 456 basis points, indicating that investors are demanding a premium of 4.56% to hold Greek government bonds compared to Bunds, even though both are denominated in Euros.

12 April 2010: Euro area member states state that they have agreed upon the terms of the financial support that will be given to Greece, if it asks for it, including up to €30 billion for financing needs. Reuters reported that “together with at least 10 billion euros expected from the International Monetary Fund in the first year, it could add up to the biggest multilateral financial rescue ever attempted”.»⁴⁷⁹

June 2010.

In a speech on 18/6/10 Sheila Bair of the FDIC said the following about mortgage origination:

«First, we must recognize that the financial crisis was triggered by a reckless departure from tried and true, common-sense loan underwriting practices. [...]»

Traditional mortgage lending worked so well in the past because lenders required sizeable down payments, solid borrower credit histories, proper income documentation, and sufficient income to make regular payments at the fully-indexed rate of the loan. Not only were these bedrock principles relaxed in the run-up to the crisis, but they were frequently relaxed all at once in the same loans in a practice regulators refer to as "risk layering."»⁴⁸⁰

Nevertheless:

«Sheila Bair’s advice was not followed in the recently enacted Financial Reform Bill. In Section 941, Congress charges regulators with defining the characteristics of a “qualifying residential mortgage”. Such a mortgage should have “underwriting and product features that historical loan performance data indicate result in a lower risk of default.” Conspicuous in their absence from the list are LTV and borrower credit history. This is a repeat of the identical error made by Congress when it passed the GSE Act of 1992 and pushed the GSEs into reduced downpayment and other loosened lending standards.»⁴⁸¹

FHFA simplifies the affordable housing goals. The FCIC Wallison report evaluates the changes as follows:

«When Congress enacted the Housing and Economic Recovery Act of 2008 (HERA), it transferred the responsibility for administering the affordable housing goals from HUD to FHFA.⁴⁸² In 2010, FHFA modified and simplified the AH goals, and eliminated one of their most troubling elements. As Fannie had noted, if the AH goals exceed the number of goals-eligible borrowers in the market, they were being forced to allocate credit, taking it from the middle class and providing it to low income borrowers. In effect, there was a conflict between their mission to advance affordable housing and their mission to maintain a liquid secondary mortgage market for most mortgages in the U.S. The new FHFA rule does not require the GSEs to purchase more qualifying loans than the percentage of the total market that these loans constitute.

This does not solve all the major problems with the AH goals. In the sense that the goals enable the government to direct where a private company extends credit, they are inherently a form of government credit allocation. More significantly, the competition among the GSEs, FHA and the banks that are required under the CRA to find and acquire the same kind of loans will continue to

⁴⁷⁸ BBC Timeline: The unfolding eurozone crisis, 19/4/12.

⁴⁷⁹ Timeline UK House of Commons p. 35.

⁴⁸⁰ Pinto p. 155.

⁴⁸¹ Pinto’s note 405 on p. 156.

⁴⁸² Note that realization of policy goals may be incompatible with supervision (safe and sound operation). It is this incompatibility which can be seen as principal cause of the crisis.

cause the same underpricing of risk on these loans that eventually brought about the mortgage meltdown and the financial crisis.»⁴⁸³

This must have been an individual action of FHFA, and premature at that. It cannot have been based on a sound evaluation. The FCIC was still holding its hearings, and would report only in January 2011.

2011.

On 1 January 2011, Estonia joins the euro area.

Long before the damage of the subprime crisis had been undone, it was joined by a eurocrisis.⁴⁸⁴ Both crises affected almost all the countries in the world, if not directly then indirectly.

In general it seems to be impossible to attribute specific consequences to either the subprime crisis or the euro (debt) crisis. Neither is it clear whether the eurocrisis was triggered by the subprime crisis. It certainly was not caused by the subprime crisis. As noted earlier, sooner or later a euro debt crisis was unavoidable. The only difficulty was to forecast the approximate date and form.

In 1991 the EC had set norms for budget deficits and government debts. The norms may be debatable, but they were definitely not too strict. For many years they were exceeded as a matter of course. But no corrective action had been taken. Greece had been admitted to the euro area while its debt was 104% instead of less than 60%. See above, under 2000.

Instead of putting Karamanlis and his henchmen in prison because of fraud and other inappropriate conduct, and to make a long term plan⁴⁸⁵ for the restoration of the Greek public finances, the EU and IMF forced Greece to solve its problems in a relatively small number of years. The debt problem is old and very large. Taking account of the meaning of a debt of the size of GDP and its long history, one must conclude that it is highly improbable or impossible to solve it in say 5 years.⁴⁸⁶ At least not without making very many innocent victims.⁴⁸⁷ The more so since it is the opposite of justice to punish innocent people with unemployment and tax increases while allowing the responsible politicians to go free and unpunished.^{488, 489}

In fact, many of the politicians who are co-responsible for increasing the debt of the government of their country in the past 20 years are still in power, or have more powerful (and better paid) positions. For several years president Barroso of the European Commission and managing director Lagarde of the IMF were minister in a EU country, and co-responsible for budget deficits and increasing government debt.⁴⁹⁰ To mention just a few examples.

⁴⁸³ FCIC Wallison report pp. 518-9/546-7.

⁴⁸⁴ The timelines for the subprime crisis used in this chronicle end at the following dates:

- University of Iowa 25/6/09.
- UK House of Commons 12/4/10. (The last two pieces of info concern the Greek crisis).
- Inverse timeline of Chunlin Liu 21/8/09.
- Wiki Subprime crisis impact December 2008, apart from incidental remarks about later events.

That at least was the state of affairs at the end of May 2012, when most of these files were downloaded.

⁴⁸⁵ By long term I mean 10 or more years. A long term should have been proposed to minimize the suffering of the innocent Greek people.

⁴⁸⁶ This reflects the situation in 2011. The Greek crisis would last until at least 2016. By that time the loans had multiplied, and were extended for decades.

⁴⁸⁷ The innocence is not complete. In “democratic” countries civilians make themselves co-responsible by voting. And by not protesting, if I knew of any meaningful way to protest.

⁴⁸⁸ Probably even to continue living well off the spoils of their term in power.

⁴⁸⁹ Note that civilian victims of military violence are quite generally called “innocent civilians”. Civilians are protected by the law of war, at least formally. If this kind of protection is necessary and just, why is there no law protecting them against actions like those of the EU and IMF, or even Karamanlis? But at least in “democratic” countries civilians are not entirely innocent. Participation in elections makes them co-responsible.

⁴⁹⁰ See the file about Barroso, and for Lagarde the Reuters paper Eurogeddon, under 20120802. For budget deficits and government debt see one or more of the *Economic Outlook* publications of the OECD.

Chapter 7.

The financial crises of 2007-2013.

Part B. Analysis.

Table of contents of this chapter.

1. Introductory notes.
2. Education and sciences.
3. Risk, rating, risk management and liability.
4. Failures of governments and parliaments.
5. National supervision.
6. International and other organizations involved in financial-economic affairs.
7. The inquiry commissions CDW and FCIC
8. The principal persons.
9. Summaries and conclusions.

7B.1. Introductory notes.

Table of contents of this section.

1. System instability as a fundamental cause of crises.
2. The concept of “cause” in connection with the crisis.
3. How the analyses and evaluations in this chapter came to be made.
4. Explanation of the structure of this chapter.
5. Methodological note.

This section discusses topics of a general nature. The discussions provide necessary background for the main body of this chapter. They present some basic facts, and explain some of the characteristics of the contents of the chapter.

1. System instability as a fundamental cause of crises.

Systemic sensitivities and mechanisms for amplifications of disturbances.

Experience shows that financial economic crises are not exceptional. They occur several times a century, at irregular times. They differ in character, size and consequences. No two are the same. They seem to be unpredictable. As a phenomenon, crises are not hard to understand. They occur because the financial economic system has properties which make it unstable. The instability means that disturbances of certain types are amplified by the system. Such disturbances can have consequences which are very much larger than their initial size would make one expect. In an unstable system, large consequences need not have large causes. In a stable system on the other hand, disturbances are reduced by the system, or at least do not grow. The following shows properties which make the financial economic system unstable.

For a start it should be noted that to a large extent financial economic valuations are subjective and arbitrary. They are determined by “the market”: by the opinions of buyers and sellers. They are determined by the confrontation of supply and demand. In general they are determined by the supply and demand of a marginal amount of the product involved. Especially crises show that valuations may change substantially and fast. The size of the changes, and the time of their occurrence, seem hard to predict however. It may seem obvious for example that home prices cannot rise forever. That sometime they will stabilize or start to fall. But even if this is acknowledged, it is quite another matter to predict the time of the turnaround, or the maximum price level.

The value of products is often determined on the basis of relatively marginal and sensitive

quantities, such as the size of the supply or demand on a given day. The value of an enterprise (on the stock market for example) is determined in part by its income of the last year and quarter, and the expectations for the future. Its income can be called a marginal quantity because it is the difference between quantities like revenue and costs. Both of which are much larger, and may be very much larger, than their difference. Enterprise income is called sensitive because it may depend relatively strongly on factors which are hard to manage by the enterprise. Such as interest rates, price developments in different markets, and availability and cost of suitable employees.¹ A relatively small decrease in the value of yearly sales due to the arrival of a new competitor may turn profit into loss.²

The market value and share price of an enterprise are very sensitive to changes in perceived profitability, now and in the future. There is good reason for this. An investor is interested in the yield of his shares. Both in the absolute sense, and relative, with respect to other investment possibilities, such as bonds or a savings account. He will choose the investments with the highest yield and best prospects, in his personal judgment. Of course an investor can take account of more aspects. But that does not change the fact that almost everybody who must choose between possibilities which differ only in yield, will choose the most profitable.

The future is uncertain. That of some enterprises and matters more than that of others. Confidence in the future varies. An increase in uncertainty means more risk, and reduces all kinds of market values, and vice versa. Dependence on forecasts therefore contributes to the sensitivity of valuations.

By the way it can be noted that more profits in general mean more possibilities for growth, while persistent losses must result in shrinkage, and may threaten survival. Obviously this observation supports the use of profitability as a measure for valuation.

These observations show that the market value of an enterprise is a relatively sensitive quantity. It changes in accordance with profitability, a marginal and sensitive quantity. This agrees with observations of stock and related markets.

If the profitability of an enterprise decreases, and/or the uncertainty about its future increases, its market value diminishes. As a consequence, if the profitability of most or all enterprises decreases, and/or the uncertainty about their future increases, the capital of society diminishes. Not only in markets or on paper, but also in the other part of reality. It is simply (psycho)logical, and practically necessary, that people take account of the general and their personal financial situation. Not only in decisions about saving or investing, but also when taking decisions in daily life, such as shopping for daily needs. If economic prospects look dim, and/or if their capital diminishes, they will be more careful and spend less. When they buy less, the production of at least some products has to be turned back (further). In general this will reduce profits. It may make reduction of production capacity compulsory. Thereby amplifying the causal phenomena.

It follows that in the financial economic system shrinkage can amplify itself. If the system would be stable for shrinkage, shrinkage would cause growth, canceling the shrinkage at least partially. This obviously is not the case. The system is unstable with respect to shrinkage, at least some kinds of shrinkage. Where shrinkage means shrinkage per unit time. There are mechanisms which dampen the speed of shrinkage. Such as a long term order portfolio and the law concerning termination of employment. Nevertheless: historical crises show that both at the stock exchange and in a bankruptcy events may follow one another with surprising speed.

The opposite is true as well: economic growth is a self amplifying phenomenon. Although historical crises show that as a rule shrinkage takes place much faster than growth. This is quite understandable. In practice, growth is not the straightforward opposite of shrinkage. People react differently on growth and shrinkage. One can stop buying unnecessary things completely and immediately. Buying more than one is used to in general takes time. A production chain in general is somewhat elastic. It is somewhat elastic in both directions: output can be increased or decreased, at least to a limited extent. However, beyond the given margins, increasing and decreasing production are very different processes, having very different timescales. Reacting to growth possibilities in

¹ In this study the word “employee” refers to all employees of an organization, including its management.

² In the words of Thomas Ittelson: «Profit is the difference between two large numbers: (1) sales less (2) costs & expenses. Small changes in either can result in large swings in profit (loss)». Thomas R. Ittelson, *Financial statements*, revised and expanded edition, Career Press, Pompton Plains (NJ), 2016, p. 150 (box).

general takes much more time than reacting to a need for output reduction. Finally, for both people and enterprises it is important that there is a big difference between the risks of spending more and spending less. In general the risk of spending too much is appreciably greater than the risk of spending too little.

There is a logical reason for growth after a period of restrained demand due to calamities or impairment of economic processes. This is what happens naturally after a crisis. There is however no logical reason for net growth over and above this making up arrears. There is no logical reason for a surplus of affordable and desirable new products and services over the reduction of needs and costs due to greater efficiency. (Efficiency increases can be seen as a form of innovation too, by the way). In other words: growth can not be expected to continue without end.

Taken together, the above means that in general a period of growth will be followed by a period of shrinkage, and a period of shrinkage by a period of growth. In this connection some people speak of a cycle. Since there is no reason for successive periods to have the same length even approximately, and since both growth and shrinkage may be larger or smaller, possibly making succeeding periods very dissimilar, this is misleading. There are ups and downs, but of possibly widely varying amplitudes and lengths.

Sensitivities and instability explain the crisis of 1929-1932.

The mechanisms sketched in the preceding subsection explain most of the phenomena which can be observed in periods of crisis. Including the crisis of 1929-1932. In the years before that crisis, share prices and price/earnings (P/E) ratios had increased very substantially. A priori it is clear that prices of specific products cannot rise indefinitely without causing some kind of neutralizing reaction. At a given moment things will happen which make some people suspect that a turnaround is around the corner or already taking place. Some of them start to sell, disturbing the previously existing equilibrium between the numbers of buyers and sellers. The growing number of sellers is real. The drop in prices will alert and convince more people of the wisdom to sell.^{3, 4} Especially if the drop was inspired by something real, visible for everybody. As a consequence, the drop in prices continues. Etcetera, depending of the perceived seriousness of the causational phenomenon. Capital is destroyed.

A market is an exchange for possibly marginal amounts of the products involved. All the same, a price decrease on the market affects the value of the whole stock of these products. All owners lose, not only those buying and selling. All owners begin to have doubts about their own financial situation; everybody loses confidence in the economic situation of their country. Everyone who fears having less to spend, will spend less. As a consequence, profits decrease, and may even turn into losses. Even at identical P/E ratios, share prices have to go down. Government income (tax proceeds) decreases as well.

It is clear that a downward development is hard to stop. Indeed, the bottom of the crisis beginning in 1929 was only reached in 1932. And according to the article “Great Depression” in the Britannica 2002, the economic slump caused by the crash «lasted until about 1939». There is a kind of a bottom, because people need food and roof, schools, doctors etcetera. But even basic needs are elastic. There may furthermore be a need for the restoration of confidence by replacing people who occupy the positions which are most important for the operation of the financial economic system. By people who cannot be held responsible for the crisis, and may be believed to be better.

The Britannica 2002 says that «[the reasons for the collapse of the stock market \[of 1929\] are many and complicated](#)». If this refers to the exact nature of the behavior of the relevant actors and the causes of precisely October 24, 1929 as “Black Thursday”, and other details of the crash/crisis, this may be true.⁵ But it is not true that the cause of a crisis is manifold and complex in every sense. The fundamental cause of crises is very simple: the financial economic system is unstable due to the simple

³ Otherwise they will not, and the price recovers. This is seen daily, weekly, monthly: at any time scale.

⁴ The explanation is simplified in several respects. There are always sellers, so what matters is the relative increase of their number. Prices do not need to decrease to be cause for alarm, less growth may be sufficient. Etcetera.

⁵ By definition an “actor” is a person who, or organization which, acts.

mechanisms described above. The details do not matter; in the end they make no difference.

Preliminary note on the role of government and supervision.

When a sector of the economy, or society as a whole, becomes aware of having underestimated uncertainty or risks, significant devaluation of its capital is the logical result. The devaluation will affect the economy and the welfare of many. The question is how such a loss of capital can be reversed, or how its effects can be prevented or reduced.⁶ Increasing the government budget and expenditure may reduce some unwanted consequences, but is not equivalent with recovery of valuations. It may even create new or additional problems, depending on people's spending possibilities and habits, and on the state of the government finances. Devaluation of economic capital in general will be accompanied by less government tax income, not by more. The government can borrow, but borrowing costs money. It entails risks, and reduces future freedom of action.

Security prices are determined by supply and demand on markets operating under conditions set by governments. But governments do not in general actively influence supply and demand. To a lesser extent this also applies to central banks. Central banks do influence interest rates and the amount of money in circulation. Their ability to influence market prices of securities in general is relatively small however.

Contrary to natural persons and enterprises, and as a consequence of their specific duties, governments (states) hardly own securities. One of their important activities is: to tax and spend tax income, supposedly for the general welfare. In the exceptional case that a government has a budget surplus, it might buy back its own bonds or invest in securities. In the last case it has an interest in stable or increasing prices, not in their fall.

The Chronicle shows that phenomena related to the crises have made very many innocent victims. The overwhelming majority were made during and shortly after the crash years 2007-2008, but also in earlier years.⁷ Reparation of the damage caused is very incomplete. The inadequacy of the reparation may be related to the roles of governments in the causation of the crisis. They played a decisive role by facilitating and encouraging various financial institutions, including supervisors, to take unprecedented risks. The same persons and institutions who for many years claimed that the financial economic system was healthy, actually caused the crises. By actions and omissions. According to most people they should legally be responsible for reparation of damage caused. The same persons and institutions are also responsible for prevention of repetition. The Chronicle and following sections show however, that the understanding of the relevant financial economic phenomena by governments and supervisors is fatally deficient.⁸ Governments and supervisors deny any serious avoidable wrongdoing. They deny responsibility for the crisis and the damage done. Given this turbid situation, it cannot come as a surprise that the measures which governments took will be seen to be inadequate. Reparation is limited at best.⁹ The root causes are not addressed.

The maxim "prevention is better than cure" is not really applicable. In the case of large financial crises "cure" is practically impossible.¹⁰ Prevention is the only feasible approach. Law, government and supervisors should ensure that unbearable risks are not taken. This is the *raison d'être* of the supervisors, and one of the main *raisons d'être* of governments. However, nothing in the reports of BIS, CPB, CDW, DNB, FCIC, Fed, IMF or anyone else in the period under consideration testifies to the understanding of the instability of the financial economic system. They show no knowledge or understanding of the mechanisms by which certain negative developments (disturbances) are amplified.¹¹ None admits grave errors.

⁶ Or how the overvaluation could have been prevented in the first place.

⁷ The "related phenomena" include the repressive political and supervisory climate. The victims include those who lost their job or career perspective due to well founded objections against reliance of self-regulation.

⁸ As always in this book, the word "fatally" is used, and only used, if something is bound to cause great harm.

⁹ Reparation should be distinguished from saving financial institutions.

¹⁰ Not in the last place as a consequence of inadequate and discriminatory liability law.

¹¹ BIS= Bank for International Settlements; CPB= Central Planning Bureau (of the Netherlands); CDW (parliamentary inquiry) Commission De Wit; DNB= De Nederlandsche Bank, the Dutch central bank & supervisor, in other words: the Dutch Fed; FCIC= Financial Crisis Inquiry Commission of the US Congress; Fed= Federal Reserve Bank of the USA; IMF= International Monetary Fund.

2. The concept of “cause” in relation to the crisis.

In this study, “a cause” means something- a circumstance, mechanism, act, inaction, omission, or whatever- which has a given consequence. A cause is by definition sufficient for a consequence to be realized. But a given cause need not be necessary. A consequence may have different causes. It may, but need not, require the simultaneous occurrence of a number of causes. A consequence may only occur if a number of independent conditions is fulfilled simultaneously. Conditions concerning circumstances, actions, omissions, etcetera.

There is ambiguity (multivalency, arbitrariness) in the use of the word “cause”. The reason being that in general causes have causes. That is to say: in general there is a chain of causes. The cause of a cause may be called cause just as well as any other cause in the chain. An ultimate cause- a cause without a cause- is never or almost never known.¹² This can be illustrated by an example. “Supervision dysfunctioned” can be called a cause (or contributing cause) of the subprime crisis. But then one can ask: what is the cause of this dysfunction?

(Partial) Causes need not be of the same kind. Some partial causes may only affect magnitude, others the time of occurrence. Causes need not have a binary (yes/no) character. There may be important qualitative dimensions. They may be important for prevention of repetition.

Because of the ambiguity of the concept “cause” it is impossible and useless to look for causes in the abstract.¹³ One always has to make a choice.

The analyses in this chapter can be seen as efforts to find causes of the crises. But they have another goal as well. Like the analyses in the other chapters the analyses in the present chapter are aimed at a better understanding of the operation of governments. They should help to understand and explain governments. But understanding and explanation are no more than intermediate goals. Understanding and explanation are means to find out what can or must be done to prevent disasters like crises. Prevention is the final goal of the study. And it is this final goal which is used as the criterion for the selection of the types of explanations and causes. The study looks for explanations and causes which offer starting points for finding solutions.

For the same reason we look for changeable causes. By definition, a phenomenon has changeable causes if the phenomenon is a consequence of causes made by people, or causes which were or can be changed by people. Examples are: avoidable acts and omissions, the ways in which things are regulated (or not) in society and state (including the law), and education. Someone who wants things to go differently in the future is interested in causes which offer opportunities for changes for the better. There are disasters lacking changeable causes, or insufficient changeable causes to explain and prevent the disaster. Such as natural disasters. But it will turn out that the financial crises are wholly man-made. All of its causes can be eliminated. Like the US Financial crisis inquiry commission (FCIC), this study concludes that the subprime (financial) crisis was avoidable. Of the second financial crisis, the debt crisis, this is obvious. In other words: both crises had only changeable and avoidable causes.

Both causes and conclusions can be formulated at different levels of abstraction. Where the causes in the chain of causes are assumed to correspond with levels. The desired abstraction level of causes and conclusions determines what has to be investigated, and how “deep” one has to go. At the chosen level of abstraction no important questions with respect to causes should remain unanswered. In this sense the choice of the level of abstraction determines the required completeness of an investigation.

The choice of a level of abstraction has consequences for the usefulness of the findings of an inquiry. Very deep or abstract causes may not be manageable or changeable. Such as “to err is human”, and the laws of physics. To be manageable and changeable, causes should be part of practical changeable reality. An important example is the call for better risk management. Someone who tries to answer the question how that is to be realized, discovers that the law sets no limits to risk taking. He

¹² This is something to think about, but outside the scope of this study.

¹³ Note that failure to understand the ambiguity of “cause” may give rise to wasteful discussions.

will understand that the risk management was inadequate because limits were fictional and competitors real, and because more risk may mean more profit and market share.

Inquiries like those of the CDW and FCIC should serve a practical purpose. In the case of the crisis: prevention of repetition. The choice of the level of abstraction can therefore best be made with this practical purpose in mind. This means that the set of causes to be discovered should explain the observed phenomena, and offer sufficient handles for changes that make repetition impossible (or at least implausible). With only the first criterion, the concept “cause” remains multivalent, and may yield very different reports.

So the present study tries to find sufficient changeable causes. Where the “sufficient” refers to “changeable causes”, not to “changeable”. The study looks for causes which can be removed. It must be plausible, or provable, that the phenomena under consideration will not occur if the designated causes have been removed. Or at least that the phenomena were unavoidable, and could not have been prevented. To make sure that removal of a certain set of potential causes is sufficient, it will be tried to find all potential causes. Because a chain is as strong as its weakest link, and a single overlooked cause may be sufficient.

False pretensions look like an important cause. But at this point in the study the possibility of an underlying more fundamental cause cannot be excluded. Why are false pretensions omnipresent? The false pretensions may be the consequence of a deeper (changeable) cause. This study anyway does not assume that people can change pretending. It assumes that the incidence of false pretensions is changeable only in so far as selection procedures and appointments are changeable. But these are part of a larger coherent system, which at this point in the study is not really understood. In a coherent system one may not be able to change one part without changing other parts. Before continuing the analysis of false pretensions however, it seems wise to review the phenomena and relations that may be relevant for understanding the developments that resulted in the crises.

3. How the analyses and evaluations in this chapter came to be made.

Rather queer and incredible testimony before the Commission De Wit (CDW) was the reason for looking better at the financial crisis. Initially the report of the FCIC majority was used as a guide. Somewhat later it was supplemented by the minority report of Wallison. Where useful or necessary, the sources of these reports were studied as well. In doing so, and by looking around, much useful literature was found and studied.

With increasing knowledge and understanding the present investigation became more and more independent from CDW and FCIC. Study of the annual reports of the Dutch central bank and the minority report of Wallison showed that the reports of the CDW and the majority of the FCIC could not be relied on. Study of the annual reports of supervisors and reports of the US General Accounting Office (GAO¹⁴) subsequently showed that governments and supervisors had failed very much more than transpired in the reports of the inquiry commissions (CDW and FCIC), let alone the media. Where “failed” is a misleading understatement. In an effort to better understand the commissions and supervisors, the later stages of the investigation were mainly devoted to studies of annual and other relevant reports of supervisors (in a wide sense, including BIS, IMF and OECD), and of hearings by CDW and FCIC.

After the initial phase, the work on this chapter 7 was mainly guided not by any of the documents mentioned, but by the wish to get a picture and explanation of the phenomena. To get a picture that is consistent¹⁵ and answers all important “thinkable” questions. And which provides starting points for the development of a sufficient set of measures for the prevention of similar phenomena. Given the picture and explanation, it should be plausible to assume that the measures are necessary and have the desired effect.

4. Explanation of the structure of this chapter.

¹⁴ In 2004 the name was changed into Government Accountability Office.

¹⁵ Internally, and with all available evidence.

The next section, 7B.2, Education and sciences, tries to answer the question: how could so many people fail if the education system is excellent and economic science is at a high level? The section tries to solve the apparent inconsistency.

Like the above subsection about instability, section 7B.3, Risk, rating, risk management, and liability, is a reaction to the observation that all or almost all of the principal actors and investigators lack even elementary, for their function essential, understanding of the basic concepts of probability theory, and of the necessity of boundary conditions for risk management. Their lack of understanding can be seen as part of the explanation of the crisis. This observation is also important when evaluating the competence of the principal actors, and the development of measures for prevention of repetition.

In analyses of the crises it is useful to make two types of distinctions. In the first place with respect to function. The different kinds of function are:

1. Political and governmental;
2. Supervision (including regulation to implement laws);
3. Rating;
4. Banking;
5. Investigation (the inquiry commissions).

These functions are fulfilled in the framework of hierarchical organizations. In that kind of organization one distinction is of decisive importance, not only in theory, but also in practice: that of the boss at the top, and his or her subordinates. The correctness and relevance of this distinction is confirmed by the empirical evidence.¹⁶ That's why a second distinction will be made, with two categories:

1. Heads (and top managers);
2. Subordinates.

The sections 7B.4-7B.8 correspond to these classifications. Section 7B.9 gives summaries and conclusions.

The empirical evidence, including that about selection processes, shows that most subordinates (and other citizens) differ from the heads of their organization with respect to norms, values and competences. From the point of view of prevention of crises, it is of great importance to find the answer to the question: how it is possible that subordinates have not been able to exert any correcting influence, in spite of their number and competences. This question is not asked or answered by the inquiry commissions, or by others. Only very little positive information has been found about the role of subordinates in organizations involved in the crisis. Though very numerous, they are nearly invisible. A little other information can be inferred from the absence of certain types of information. The findings will be discussed where fitting. There is however not enough empirical material to warrant a separate section on subordinates.

The analysis will show that the principal characters are neither honorable nor competent. Apart from their words in public, their conduct is very different from what their job requires, from what almost everybody expects of them, and from what they themselves assert may be expected of them. There is ample empirical evidence about them. In the inquiries of CDW and FCIC they played a dominant role. (There too their subordinates were hardly visible). Because they occupy key positions in society and in the explanation of the crises a separate section is devoted to them (7B.8).

The reports of CDW and FCIC are not discussed as such. There is no separate (sub)section about them. They will be evaluated in the course of the discussion of other subjects. It seemed to be inefficient to spend more words on them. Still, the reports and other products of the commissions have been studied thoroughly, even if not every part in every detail. They are very useful and highly recommended. But they have important deficiencies. Important reasons for not spending more words on them are the inadmissibly defective methodology, hearings, conclusions and recommendations of the commissions, and the availability of more than enough contemporary documents. Where "inadmissibly defective" also means: inconsistent with applicable norms. In general the defectiveness can already be inferred from internal analysis, and otherwise from inconsistency with contemporary

¹⁶ Both about the financial crises and most of the other cases mentioned in this book.

documents.

This analysis, part B of chapter 7 about the financial crises, is based on the Chronicle and numerous preliminary studies about specific persons and organizations. For several of these persons and organizations a document has been made with the most indicative or important evidence, summaries and conclusions. These documents are excerpted in the appendices or included in the dossier. The appendices may be unfinished. They may represent a stage in the study of the subject matter. They have been structured for easy use. Their function is to facilitate access to the information about their subject. Which may be voluminous, inaccessible and chaotic. Even more than the present analysis, the appendices may be seen as a guide to the sources. As intermediates between analysis and sources. Taken together, the reports of the preliminary studies were far too voluminous to insert in the Chronicle or analyses (if functional as regards contents). In the analyses only the largest common denominator of the conclusions has been integrated, and the most important or fitting specific findings.

5. Methodological note.

About the crisis and about other subjects, “experts” or high officials frequently make assertions which one does not seem to be allowed to question.¹⁷ Rarely if ever do such people admit that they don’t understand things. They rarely show uncertainty about their own statements or about the incorrectness of conflicting statements. The crisis has shown however that many of the important statements of the principal characters were inadequately founded and untrue. The suggestion of certainty was fully unjustified. The principal characters did not understand the system at all. Their self-confidence was based on quicksand, and their lack of doubt and prudence irresponsible. And these characteristics had terrible consequences.

For this reason, when listening to an interview or reading a report or whatever, the reader is advised to frequently ask himself what some assertion is based on, or could be based on.¹⁸ Even in important cases this question may only be answerable with: there cannot be an adequate basis. This applies for example to the assertion that «[the evidence to date suggests that dramatic growth in new instruments for risk transfer and the greater role of nonbank financial institutions have contributed to a more stable and more efficient financial system](#)», which was often heard in the prehistory of the subprime crisis.¹⁹ The crisis has shown that there was not and cannot have been sound evidence or proof. If the assertion had been true, there would not have been a crisis. The evidence mentioned in the assertion must have been an invention (or unfounded belief) of the speaker, and it follows that the speaker is unreliable and irresponsible. In principle the assertion could be a mistake. In this case it would have been a very consequential mistake. Whether or not an assertion can have been a mistake can sometimes be inferred from the internal evidence of the sentence, or from the context. These may or may not suggest openness or careful study and consideration. Sometimes it may be necessary to compare the probability of mistake with that of an intent to make believe. Anyway: experience shows that only few things are certain, and (for example!) that one can hardly ask too many questions.

7B.2. Education and sciences.

Table of contents of this section.

1. Introduction and conclusions.
2. Essential shortcomings of common education.
3. Economy education and economic science.
 1. The subculture of economists.
 2. The textbook *History of the American Economy*.

¹⁷ As regards the crises, the dossier is full of examples. See especially the annual reports and the hearings.

¹⁸ And please don’t forget that a reference or source doesn’t always give a proof.

¹⁹ Remarks by Mr Timothy F. Geithner, President and Chief Executive Officer of the Federal Reserve Bank of New York, at the Global Association of Risk Professionals (GARP) 7th Annual Risk Management Convention & Exhibition, New York City, 28 February 2006. BIS Review 14/2006.

3. The textbook *The heart of the economy*.
4. Two editions of the textbook *Economics* of Sloman c.s., separated by a crisis.
5. The textbook *Essentials of Strategic Management- The Quest for Competitive Advantage*.
4. The education and science of law.
5. Closing remark.

1. Introduction and conclusions.

Whether one evaluates the contents of education itself, or evaluates people's education on the basis of their functioning, in both cases one has to conclude that it is insufficient. Many of the phenomena described in this report, including the financial crises, are incompatible with the hypothesis of good education. And this applies to both general and specialized, disciplinary, education. In order to specify the deficiencies, this section will consider general education, economics education, economic "science", law studies, and the "science" of law.

Relatively much attention is paid to economics because as regards the financial crises it is the most relevant discipline, and because a majority of the people responsible for the financial system had studied economics at a (renowned) university. Without doubt, the same applies to a majority of employees of supervisors and organizations like BIS, IMF and OECD.²⁰

The law fixes the boundary conditions for human activities. If it were a science, law science should reflect critically and detachedly on these boundary conditions. The social importance of such a science is evident. But what nowadays passes for law science does not satisfy the definition of science.²¹ What passes for law science fails completely in its social function. In the subsection on this subject some of the deficiencies of law science as a science will be indicated.

It will be concluded that several subjects which are vitally important for functioning properly in modern day society are either only touched upon in education, or not treated at all. What are called economic science and law science do not satisfy the definition of science. What are called experts in economics are not experts at all, and experts at law probably know part of the law, but cannot be expected to evaluate the law as a scientist should. These and related findings greatly help understanding why crises and other man-made disasters (still) happen. One might even conjecture that they make them unavoidable.

The findings of this section are consistent with the findings of the other sections and chapters. In particular with the misconduct that can be observed in and around the crises (and other cases). None of the fatal events would be understandable if education was good, and if the "sciences" of economics and law were reliable.

The present section evaluates a small random sample of textbooks and articles. They give a similar picture. The selection is more or less accidental. In combination with the observations of 1) consistency with all empirical evidence, and 2) complete lack of any sign of non-representativity, this justifies the conclusion that the findings are representative.

2. Essential shortcomings of common education.

"Common education" refers to the part of the education program that almost everyone passes through. In other words: the concept refers to the basic knowledge and abilities which are acquired in the education system, and are shared by almost everyone. Irrespective of the form in which it is taught, or the specific type of school or didactical method. With minor adaptations many of the following remarks also apply to the other parts of the education system. Including higher education and the studies of economics and law.

One can be brief about this subject. In the light of this report, the evaluation of education is simple.

²⁰ See the appendices and the Wikipedia pages, both about specific persons. (The Wikipedia pages can be found in various directories, especially Encyclopedia/Persons and the directories of specific organizations. The name of the person always figures in the file name).

²¹ In this report, science is defined as the endeavor to find reliable explanatory knowledge about a coherent set of phenomena of given types. It is the reliability that requires openness, honesty, a critical attitude, consistency, and the testing of hypotheses. For elucidation and discussion one can consult encyclopedias.

It only requires replacement of a politically desired fiction by what your eyes show you. And comparison of the (purely logical) conclusions of this report with the thinking of the people around you, on radio and TV, in news items and “analyses” in newspapers, journals and books. And with the premises of this thinking. Someone who makes this comparison can only conclude that the “knowledge” of most people about social and political phenomena consists of little more than illusions and gaps. And that as far as their thinking is concerned, most people live in a fantasy world which has little to do with the real world. In other words: whatever the contents and organization of present day education, the result is utterly insufficient.

People do not know that government and parliaments primarily cooperate in performing a farce with the purpose of preventing replacement of illusions by a truthful picture. In particular the illusions that people are represented, and that government is supervised by parliament. People don’t know that this supervision is incidental and arbitrary at best, and in general absent. They don’t know that there is no supervision of the supervision. That supervision by parliament is not prescribed by law (or otherwise), and that inadequate supervision goes unpunished and unnoticed until something goes wrong badly. People know, but don’t realize, that nowhere else in society representatives are fully empowered for 4 years, without the least possibility of instruction or recall between times. That someone who calls himself representative does not for that reason represent anybody (beside himself).

The illusions about, and the gaps in, the knowledge and understanding of the operation of government can be attributed in the first place to education. In the second place it can be attributed to the systematic confirmation of misconceptions by publicists who don’t (but should) know better,²² and by politicians whose careers depend on these misconceptions. Education analyses neither theory nor reality. It does not teach to think critically and constructively about the phenomena described in this study. It teaches the theory of government, suggesting that theory equals reality, without showing crucial differences. Doubts arising in practical daily life are reasoned away with good intentions, the inevitability of mistakes, and the fiction that we are living in the best possible world, and that this is therefore best possible.²³

In other respects as well, education does not sufficiently prepare people for functioning in modern society. That is: as a citizen in the social context of a town, country and world. Neither does it prepare properly for working in a hierarchical organization. Irrespective of the nature of the work: management or something else. People cannot and do not know in what kind of environment they may land. (And as many cases in this report show: reality may be literally beyond imagination). They may know how it should be, but cannot have the slightest idea about reality. Those who believe that education gives a reliable picture of reality are taken by surprise, and helpless. Even those suspecting that practice is worse than theory will not have the means to cope with it. At least not if they wish to respect the norms and values which most people consider desirable or necessary.²⁴

Education does not teach how organizations operate. It does not tell that in practice, hierarchy often means dictatorship. In spite of efforts to conceal this; for example by suggesting that critical remarks and reasonable (alternative) proposals are always welcome.²⁵ Education does not tell that as a rule, codes of conduct, integrity codes, professional codes etcetera are mainly meant as propaganda. To give outsiders a positive picture of a company, profession or whatever.²⁶ It does not tell that these codes do not give rights to employees, and that breaches can be made with impunity. It does not explain why separation of powers is good for society at large, and bad for hierarchical organizations.²⁷ It does not explain how hierarchical organizations can deal properly with breaches of codes in spite of union of powers, if society cannot. Of course, previous cases have already shown that in important cases breaches of codes were not treated properly at all. Worse: most cases suggest that breaches are a

²² Or don’t want to know better, for social and career reasons.

²³ And that wars and crises are unavoidable.

²⁴ And which are the only defensible ones. See *Communication and norms* (available as pdf file on the internet), or www.lawoflogic.net.

²⁵ But there is not the least guarantee that they will not be thrown in the dustbin right away. There is no procedure which guarantees that remarks and proposals are treated reasonably.

²⁶ Integrity codes also regard other forms of misconduct than shown in this book. If the top is not involved, as in cases of theft or sexual harassment low in the hierarchy, a code may function properly. The top however can breach a code with impunity. And the top protects everyone doing what it asks of them, directly or indirectly.

²⁷ The “powers” are: law making, judiciary, and executive. The law includes what is often called “regulation”.

conditio sine qua non for a successful career. And that an appeal to a code marks an employee for ever. That it leads to isolation in the organization and immeasurable misery. But to nothing useful.²⁸

The education program is neither the only problem, nor the ultimate cause of the problem(s). The antiquated and theoretical character of the program, and the lack of interest in preparing pupils and students for the real world, can be partially explained by the closed character of the world of education. Almost all teachers (including university professors) lived their entire lives in the world of education. They never worked, as an insider, outside education. Even if they learned something about the outside world from practical experience, and were able to replace part of their illusions by more reliable pictures, it would be a miracle if they could transform these into an orderly explanatory description, usable in education; and if they could get the approval for actual use from the authorities. In every other case teachers have to comply with the prescribed programs, book selections, etcetera.

Finally, in general the formulation of education programs is managed by governments. If only by selecting the members of “independent” program commissions.²⁹ Compliance with an approved program may be a requisite for subsidy of either the education institution and/or students taking courses.

3. Economy education and economic science.

Note. This subsection also uses results of later sections of this chapter.

The subculture of economists.

The terminology “subculture” is used because there is an important common denominator in the thinking about economic questions by economists, and because the norms and values defining this denominator differ in important respects from those of society at large. Money is the dominant value of this subculture. Sometimes a publication begins by telling that non-financial values will be considered on an equal footing with financial values. For example by translating non-financial values in numbers of dollars. But as a rule the promise is entirely forgotten in the remainder of the publication.³⁰ The “science” of economics is not an empirical science. Often the relationship between quantities and assertions of economics and reality is undefined and unclear. Premises are almost never formulated unambiguously and exhaustively. For these and more reasons economic theories and assertions cannot be relied on.

The values necessary for the development of economics as a science are inconsistent with the positive picture of the accomplishments of economics which economists seem to think they need to proclaim for career purposes. If economics were a science, economists would show much more restraint with respect to their accomplishments. They would be much more careful in the use of economics in their work. As it is, the false pretensions are a recipe for (continued) corruption of economics as a discipline.

The existence of a distinct subculture of economists can be explained by the combination of the sorry state of economics, the shared self-interest of most economists, and the large influence of education institutions on economical thinking and thinking about economics in society. The education institutions are the place where almost all economists are educated. Outside the world of education, the institutions are influential through the economists they have trained, through their relatively large contribution to the production of new economic publications, and by providing advice and “experts”.

It should be noted that this section cannot and does not conclude that economics is worse than any other discipline. Law is just as bad or worse. The point is that economics is of far more importance for

²⁸ See in particular the whistleblower cases in the following chapter, and the reports of the projects in the Dutch ministry of education in the preceding ones.

²⁹ The inquiry commissions CDW and FCIC clearly show what this means.

³⁰ An example is Richard A Posner *Economic Analysis Of Law* 5th edition, 1998, Aspen Law and Business, a division of Aspen Publishers, Inc., a Wolters Kluwer Company (formerly published by Little, Brown and Company), ISBN 1-56706-562-7, hardcover, xxii+802 pp. The assumption that everything of value can be translated in a number of dollars is debatable. The assumption can be qualified as “1-dimensional” thinking.

the financial economic system and politics than most other disciplines, and failed disastrously. That is why it is studied more closely: to explain this failure. And to find out what can be done about it.

The book "History of the American Economy" of Walton & Rockoff.^{31, 32}

Chapter 23 of this book is entitled *The Great Depression*. After a discussion and analysis of the depression of 1929-1932 (or 1939) comes a section where the authors ask and answer the following question:

«CAN IT HAPPEN AGAIN?

No one, unfortunately, can say for certain that such a depression cannot happen again. But there are many reasons for thinking that a collapse on the scale of the Great Depression is a remote possibility under modern circumstances.

One reason is that we are not likely to repeat the same mistakes. The Federal Reserve, with better data at hand and with the experience of the Great Depression laid out in many books and articles, is unlikely to permit a complete collapse of the banking system. Moreover, because we are no longer on a gold standard, the Fed's ability to create dollars during a crisis is virtually unlimited.

The same is true of fiscal policy, although here we cannot be quite so confident. Faith in a balanced budget seems to be hard to shake, even under very dire circumstances. Nevertheless, it seems likely that conditions similar to those of the early 1930s would be met today with tax cuts and increased spending on a substantial scale. Many sorts of spending, such as unemployment benefits, would increase even without specific congressional actions — the so-called automatic stabilizers.

The private economy, too, is less vulnerable to economic collapse. The industrial sector, particularly producers of consumer durables, seems to be the most vulnerable to sudden shifts in demand that lead to massive layoffs. But this sector is now relatively much smaller compared with the service sector than it was in the 1930s. The rapid increase in two-earner households, moreover, has reduced the probability for many families that an economic downturn will completely deprive them of an income.

Finally, there exists a vast network of government programs that would alleviate suffering and, simply by being there, reduce the chance of a paralyzing fear. These include the Federal Deposit Insurance Corporation, the Pension Guarantee Corporation, and others. But however much we may be aware of these facts, it is nevertheless true that the nightmare of the Great Depression comes back to haunt us time and again when conditions in one sector or another take a turn for the worse.³³

This section is uncritical to such an extent as to be useless and misleading. What it says has more to do with belief than science. The authors don't seem to be aware of essential implicit and incorrect assumptions. For none of the important assertions do they give substantiation or sources.

- What is the basis for the assertion that “we are not likely to repeat the same mistakes”? “Not likely” is of course rather vague, unspecified. But modern economists seem to have forgotten, for example, that the French revolution was the consequence of government debt run out of control. A look at the Annex Tables of an OECD *Economic Outlook* would have shown the authors that the US gross government debt in 1997 was 72% of GDP,³⁴ and that for Belgium and Italy it was more than 100%. In 2010 the Greek government debt would almost result in a revolution (in Greece). So the assertion that “we” are not likely to repeat

³¹ *History Of The American Economy* 8th Edition, Gory M. Walton (University Of California, Davis) and Hugh Rockoff (Rutgers University), The Dryden Press, Harcourt Brace College Publishers, 1998, ISBN 0-03-024579-6 p. 536-7.

³² Already as a boy the author was interested in history. Later on he added economics. Witness the paper *R&D en economische structuur* (R&D and economic structure) in ESB (1988). He bought the book of Walton and Rockoff around 2000 because of interest in history and economics. Not for a special purpose.

³³ *History Of The American Economy* pp. 536-7.

³⁴ OECD Economic Outlook 2000-1 table 34.

the same mistakes not only lacks substantiation, but is incompatible with facts.

- “[The Federal Reserve, with better data at hand](#)”: are the data only better than those of 1920-1930, or better for the world of 2010 than those of 1920-1930 for the world of the Great Depression? After all, the financial world has changed. The answer is: only the first. In the GAO report of 1994 Walton & Rockoff could have read that supervision lacks important information. They could have drawn the same conclusion from their own analysis, if they had made it. As it is, their remark reflects no more than blind faith and wishful thinking. It shows that the authors are not aware of the fact that financial institutions only provide supervisors with information prescribed by regulation, and that regulation may be inadequate due to political interests, goals or stupidity. Neither do they seem to be aware of the possibility that supervision is inadequate.
- The “[Great Depression \[may be\] laid out in many books and articles](#)”. But that does not mean that it is understood, or that its essential features are understood. In the introduction of the chapter Walton & Rockoff themselves admit: “[scholars are still far from full agreement on all the issues](#)”. They do not even understand the most essential feature, the instability of the financial economic system. If they did, they would be much more careful in their assertions and forecasts.
- Which problems can be solved by printing dollars? Certainly not all! The question is: which specific problems can be solved that way? What are the side effects? Is it clear that printing dollars solves more problems than it creates? For example by increasing inflation and decreasing trust in money?
- “[Faith in a balanced budget seems to be hard to shake](#)” sounds rather comical after 2009. It sounds comical because of a euro crisis caused by unsupportable debts of governments, very large government debts in general, and because of the tough measures considered necessary to reduce deficits and debts. But already in 1998 it was a curious remark. As noted earlier, in that year US government debt was 72% of GDP. Such a debt is proof of a long history of substantial deficits and unbalanced budgets. In fact, the US government debt had been increasing since at least 1983. So if a political majority really believed in a balanced budget, it badly failed to live up to its belief. Walton & Rockoff don’t seem to realize that borrowing makes one dependent on lenders. Finally, they seem to have forgotten or misunderstood the French revolution. And finally”: is only the sky the limit for government debts?
- The solutions and emergency measures mentioned in the last three paragraphs may cost a lot of money. Once again Walton & Rockoff seem to presume that money grows on trees. The section would have been much more meaningful if the authors would have made the common sense remark that in normal times a balanced budget is recommendable in order to have room for maneuver in a case of emergency, and to reduce dependency on lenders as much as possible.³⁵
- The paragraph beginning with “[The private economy](#)” is an example of insufficient imagination and reflection. How is it possible that after having noted that the relative size of the industrial sector has decreased, Walton & Rockoff don’t ask themselves which sector(s) have increased, and what risks these sectors may cause? (Especially the financial sector has grown).³⁶ What is the basis for the assertion that the industrial sector “[seems to be the most vulnerable to sudden shifts in demand that lead to massive layoffs](#)”? On a comparative analysis? No source is mentioned. It will be hard to find, for the assertion is simply incorrect. Radical budget cuts by a government have the same effect (as in Greece 2010-2014). The subprime crisis was followed by massive layoffs in the financial sector, and by layoffs in other sectors somewhat later. Sudden shifts in demand may occur in every market, and are not the only relevant variable. Changes in interest rates may have disproportionate effects for example.
- The Federal Deposit Insurance Corporation and the Pension Guarantee Corporation may be

³⁵ And of course, because a balanced budget shows that politicians mean what they say and respect their own (budget) laws.

³⁶ See the FCIC report, or the US Statistical Abstract.

better than nothing, but their guarantees are limited. Walton & Rockoff could better have indicated what exactly is insured, and what part, or to what extent.

In short: the quoted section is unscientific because of the lack of substantiation and reflection, and because of the absence of systematic skepticism. It is unreliable because it is dominated by wishful thinking. This could already have been concluded in 2000. And the incorrectness of the argument is of course most clearly shown by the crises of 2007-2013.

The section demonstrates a complete incomprehension of the worlds of finance, politics, and government. It ignores available knowledge of the political and financial systems which is necessary to reason responsibly and reliably about the matters discussed. Note that Walton & Rockoff also ignore the financial scandals that gave rise to the GAO report of 1994, and the report itself (with warnings suggesting that it can happen again). The misleading nature of the section can be attributed to this broad neglect. A true scientist is permanently on the lookout for falsification.

In general, assertions that something is impossible are very tricky. Very often they turn out to be incorrect. They are very hard to prove rigorously. This has a reason. The point being that there is an essential methodological difference between proving that something is possible and proving that it is impossible.³⁷

The reasoning of Walton & Rockoff supports the assertion that (economics) education does not prepare properly for social functioning. Their book is part of the education of innumerable economists. Who therefore entered society with incorrect, risk promoting illusions. The quoted section causes underestimation of important risks. A sloppy and incorrect reasoning is presented to students as a valid argument of economic professionals.

The textbook "The heart of the economy" by Heertje & Van Sandwijk.³⁸

In Dutch secondary education, children have a number of compulsory disciplines, and have to choose an additional number from a given set of disciplines. The second set includes economics. *The heart of the economy* is the secondary education textbook for a large part of the children who have chosen economics. It is their first acquaintance with economics as a discipline. In so far as people in high functions in society had economics in their education, this book laid the foundation.

The quotes show the treatment of some subjects which are relevant in connection with the financial crises.

«13.6 Deregulation

Competition in markets is not only guaranteed by competition policy, but also by deregulation. Many government rules obstruct free competition between enterprises. We mention some examples.

The opening of shops has always been conditioned by rules. In the Law Opening Hours Shops of 1996 these rules have been relaxed. In the evening shops may remain open longer, and sometimes they may open Sundays. As a consequence shopkeepers can offer consumers more admission and service. In addition, completely new shop formulas have been developed. All this has benefited the consumer, and also improves performance of the shopping sector as regards the creation of new jobs.

The establishment of new enterprises is regulated as well. The rules are given by the Law Establishment Enterprises. Some years ago there were rules for professional skills, engineering, creditworthiness, etcetera. Since 1996 the rules have become less restrictive, making it easier to start an enterprise. Put differently, the thresholds for market entry have been lowered. So that new businesses can step into the market. This improves competition on the market.»

The section gives an incorrect and misleading picture of deregulation. It suggests that deregulation is meant to enable free competition³⁹, and that it is self-evident that deregulation is positive. But the

³⁷ In the last case, one may assume that it is possible, and try to derive a contradiction, showing that it cannot be possible. The problem is that the contradiction in general is very hard to construct.

³⁸ Kernboek 1 VWO. Second edition, 2003. Walvaboek, De Echte Kern BV, Naarden (Netherlands), ISBN 90 6675 169 x.

³⁹ Free competition, to be distinguished from honest or honorable competition.

Law Opening Hours Shops is not an example of rules which hamper free competition. Some people even think that compulsory closing times are necessary for honest competition. Because not everyone can use the new freedoms equally.

A textbook should explain that deregulation is a concept with many meanings. It should illustrate this with examples of rules and/or laws of different kinds. Both of necessary or desirable rules and unnecessary and undesirable rules. It should point out that there are rules which are formulated in general terms and applicable widely, and rules which are specific, and applicable only in special cases. It should explain why the rules are what they are. It should indicate their supposedly positive and negative effects. It should stimulate reflection, and show the harmful consequences of superficial argumentation and jumping to conclusions. Because of the wide variety of rules and laws, a simple and general judgment about deregulation is impossible.

The section *Deregulation* gives the students a bad example by authoritarian dogmatic instead of critical arguing, and by suggesting that general assertions can be proven with one or two examples. It pays no attention to the definitions of the concepts used. It seems not to be aware of the wide meaning of “deregulation”. The section gives the students two unsound lessons:

- Far reaching conclusions can be drawn on the basis of examples and tattle;
- Deregulation is good.

The prisoner's dilemma, supervision and government as seen by Heertje-Van Sandwijk. The treatment of games and the prisoner's dilemma (PD) “game” in section 5.5 is deficient as well, though less fundamentally than that of deregulation.⁴⁰ The technical concept of “game” is not defined or explained, and several sentences are unclear. But the most important is probably that the book neglects to show one of the most important reasons for instituting supervision and a government.

In the second half of the section the book analyses the following PD-game:

		Airline B	
		75,000 passengers	50,000 passengers
Airline A	75,000 passengers	(M\$ 4, M\$ 4)	(M\$ 6, M\$ 3)
	50,000 passengers	(M\$ 3, M\$ 6)	(M\$ 5, M\$ 5)

The section concludes:

«So the outcome of the game is that both airlines choose to transport many passengers. It follows that the profit of both airlines is the same, M\$ 4. [...] If the airlines A and B would agree that they both would transport a relatively small number of passengers, they make a greater profit. For this reason one often sees that enterprises which regularly play such games [...] make agreements among themselves [...]. These enterprises then form a cartel. As we saw in the preceding section, cartels are forbidden, because they obstruct competition.»

The book does not explain why competition is more important than profit maximization.⁴¹

It is clear that taken together, the airlines benefit from compliance with the agreement to transport only 50,000 passengers. However, they can profit from breaching the agreement one-sidedly, and try to get more passengers (without the other airline noticing).

Very generally it is a fundamental problem to ensure compliance with agreements. If both parties benefit from the agreement, without benefiting more by a breach, compliance is no problem. Otherwise it is. The PD game is a model for situations where compliance is beneficial for the parties taken together, and where the separate parties benefit from non-compliance. The game indicates how the problem of non-compliance can be solved. At least: under what condition there is an efficient solution. It can be solved profitably if the difference between the total profits in the different cases is sufficiently large to install and pay a supervisor/judge/enforcer. In the example M\$ 1. This is the most important lesson of the PD game. It is important because this type of situation is met very frequently. Namely in all those cases where compliance with rules of conduct is beneficial for, or desired by, a group of people (say the population, or mankind), but irritating or costly for individuals (and/or individual states).

⁴⁰ Section 5.5, Game theory, pp. 75-6.

⁴¹ And what about GDP growth?

In other words: the PD game shows for which type of problems judicial and police organizations and government can be a solution, and under what condition they can be a solution instead of an expenditure which does not pay itself back.

Heertje-Van Sandwijk neglect to note this. Both in section 5.5, section 8.10 *Supervision*, and section 9.1 *Government*. Worse, section 9.1 opens with the following assertion:

«In our open and mixed economy the central government has three functions:

1. the allocation function;
2. the redistribution function;
3. the stabilization function.»⁴²

Maybe the authors mean: “As far as the economic performance of a country is concerned, the central government has three functions”. But that is not what they say. And the assertion is not proven or substantiated. Which is not very surprising, for the enumeration is incomplete, and the assertion therefore incorrect. Namely because not only any society, but even optimal economic performance, requires regulation and compliance, and not only for the purpose of allocation, redistribution and/or stabilization. Failure to mention this fundamental role and to substantiate it with the PD game is a missed opportunity, to put it kindly. It also illustrates a lack of understanding by the authors.

The Chronicle and Analysis of the crises show that this lack of understanding of the role of government and supervision is general. With this kind of economics education, the failure of the regulation and supervision of the financial system, and the ensuing crises, should surprise nobody.

Two editions of the textbook “Economics” of Sloman c.s.⁴³

This is an undergraduate university textbook. It is introductory, and covers all of economics. Its selection was due to availability in the public library of The Hague, and the availability of both an edition from the year 2000, and an edition from 2009. The first from long before the crises, and the other from shortly after the crisis. It is an English textbook, with relatively many data and examples related to the UK. But the style is that of an American textbook, and the English context need not hinder use anywhere.

For the purpose of evaluation a list of questions was formulated. This was done before studying the books. The questions are relevant in the context of the crises. The next step was to study both editions of the book in order to see whether and how the questions were answered. The quality of the set of answers is assumed to be a reliable indication of the quality the textbook and of the economics education as preparation of people who played and play a role in and around the financial system in 1990-2010.⁴⁴ The following list gives the questions and the conclusion of the evaluation of the edition of the year 2000. The conclusion of the evaluation is expressed as a number with a value 0, 1,... 10, and a short explanation. A “0” means that the textbook is silent about the subject(s) of the question. A “10” means excellent treatment.

1. Are the concepts “economics” and/or “economic science” described clearly and defensibly, and does the book cover economics as described? - 4: *economics is defined in terms of some theoretical constituents. It lacks the distribution mentioned in the definition by the Merriam Webster.*⁴⁵ *The book does not define economics in terms of phenomena in practical reality. It covers only part of economics. In the part that is studied, essential aspects or topics are missing;*
2. Are opinions and value judgments distinguished properly from facts? Is the style of the book

⁴² Heertje & Van Sandwijk p. 128. According to p. 129 “stabilization” means stabilization of economic development.

⁴³ *Economics*, 4th edition, published 2000. John Sloman with the collaboration of Mark Sutcliffe. Prentice Hall & Financial Times, ISBN 0-13-085342-9. 772 pages + table of contents, appendices and index.

⁴⁴ The assumption being based on common sense. It should be obvious that the result of the evaluation depends only very weakly on the precise specification of the assumption. Dropping or changing a few questions would not affect the result, for example. (The evaluation is stable with respect to changes in the assumptions).

⁴⁵ Economics 1: a social science concerned chiefly with description and analysis of the production, distribution, and consumption of goods and services.

- reflective, or does it (implicitly) make important assumptions without noticing?- 4: sometimes, sometimes not (both questions);
3. Is attention paid to the choice of added value as basic measuring stick, instead of the change of the value of assets, and is the choice justified?- 3: no;
 4. Economic growth: what are the costs and benefits, why would it be necessary, what is it good for?- 7: the discussion considers a wide variety of aspects, it certainly isn't one sided, but in the end it implicitly concludes that growth is mandatory;
 5. The mixed economy: Is the book aware of the fact that only a part of the economy is a market economy? Does it discuss the types and sizes of the different industries⁴⁶? Does it describe the historical development of the relative sizes?- 4: the fact is known, but nothing is done with it. There is only marginal interest in the non-market part of the economy;
 6. Is attention given to differences in decision making in the market and non market parts of the economy (in the different "industries")?- 4, but this is a very kind valuation. There is very little or no attention for this subject;
 7. Is attention given to public choice?- 0: no;
 8. Is attention given to the role of law and government in economic activities?- 3: marginally;
 9. Is attention given to contents and influence of law and regulation?- 2: marginally;
 10. Is attention given to the influence of liability and criminal law on decision making and processes?- 0: no;
 11. Is attention given to the role of supervision?- 0: some things are said, but very insufficient. In this case, the "0" expresses the ratio between attention given and attention needed;
 12. Is attention given to risk and risk management, and the concepts bearable and unbearable⁴⁷?- 0: no;
 13. Is an explanation given of the dangers or risks of an unbalanced balance of payments (or the absence of risks)?- 5: something, but unsatisfactory;
 14. Is an explanation given of the dangers or risks of a large government debt (or the absence of risks)? 0: no.

The book may give a reliable picture of economic thinking. But it clearly has an insufficiently critical attitude towards that thinking, or accepts it blindly. Too many practically and theoretically important questions or subjects remain unmentioned. So much so that considered as a preparation for functioning in society, whether as an economist or otherwise, the textbook is not only deficient but insufficient and inadequate. If trusted and used as part of a basis for decision making on economy related matters, it will often lead to erroneous decisions and actions.

The second edition takes account of the subprime crisis. But crucial lessons have not been learnt. The information about the crisis and the analysis of the crisis are very superficial. Important facts are missing. No mention is made for example the government policy regarding affordable housing and deregulation, and the fatal dysfunctioning of the supervisors and governments (with respect to the financial system). The PD game is treated in the way of Heertje-Van Sandwijk. Not as an explanation of the raison d'être of judges, supervision and government. After the crisis the subject of supervision (regulatory bodies) is still treated only marginally.

In connection with the crisis moral hazard is mentioned: «The temptation to take more risks when you know that someone else will cover the risks if you get into difficulties. In the case of banks taking risks, the "someone else" may be another bank, the central bank, or the government»⁴⁸ But liability and criminal law remain unmentioned.

The answers to the list of questions are the same for both editions.

Adding up: the two editions of this textbook can be seen as part of the explanation of the crises. They show that nothing or hardly anything has been learnt from the crisis.

⁴⁶ In generalized sense, so as to cover all "economic" activities. That is: all activities involving money. For a specification see for example the Statistical Abstract USA 2012, table 670, p. 437.

⁴⁷ Or "financial responsibility".

⁴⁸ Sloman & Wride *Economics* 7th ed (2009) p. 512.

The textbook "Essentials of Strategic Management- The Quest for Competitive Advantage".⁴⁹

This is a textbook for undergraduate and graduate students in business studies.⁵⁰ Chapter 9 is entitled "Strategy, Ethics, and Corporate Social Responsibility". It has a section "What do we mean by business ethics".⁵¹ It begins with the following "definition":

«Business ethics involves the application of ethical principles and standards to the actions and decisions of business organizations and the conduct of their personnel.»

It doesn't say what these principles are. A little bit farther on one reads:

«Much of the crisis in residential real estate that emerged in the United States in 2007-2008 stemmed from consciously unethical strategies at certain banks and mortgage companies to boost the fees they earned on home mortgages by deliberately lowering lending standards to grant home loans to people whose incomes were insufficient to make their monthly mortgage payments. Once these banks and mortgage companies earned the fees on the so-called subprime loans they made to unqualified borrowers, they secured the assistance of investment banking firms to bundle these and other home mortgages into collateralized debt obligations and mortgage-backed securities, found means of having these high-risk securities assigned triple-A bond ratings, and auctioned them to unsuspecting investors, who later suffered huge losses when the borrowers began to default on their loan payments. The consequences of crafting strategies that cannot pass the test of moral scrutiny are manifested in sharp drops in stock price that cost shareholders billions of dollars, devastating public relations hits, sizable fines, and criminal indictments and convictions of company executives.»

This is all that is said about the crisis. If the ethical principles forbid selective and unfounded accusation, or exaggeration of misconduct, then this quote violates these principles. It is not clear whether it is true what this paragraph says, even if misconduct by banks may be considered as cause of the crisis. Substantiation is not given. As Chronicle and Analysis show, unethical behavior of banks explains only a part of the toxic mortgages and securitization. Moreover, as Wallison and Pinto show, it was HUD that began pressing for lowering lending standards.⁵² Which in practice requires unethical behavior. Furthermore, some supervisors, for example the Fed, have duties with respect to mortgages and lending which they (knowingly) neglected, with fatal consequences.⁵³ In the management and control of the financial system by supervisors, Congress and government, unethical behavior had a decisive influence. Their unethical behavior was of a different nature, and may have other causes than that of banks.

Very strictly speaking, accusing a specific group of organizations of unethical behavior, while remaining silent about similar behavior of other groups, need not mean that only the first group behaved unethically. But in practice it suggests that there is no reason for accusing the other groups, and therefore that nothing is wrong with them. It is a trick of politicians, which is unethical, and violates the norms and values of science. It is an important lack of openness. The textbook fails to let the students know that the management of the organizations concerned may require them to comply with unethical decisions and activities. Due to this omission the text fails to prepare students properly for working in organizations. Could it be that organizations sacrifice ethical principles in the "Quest for competitive advantage" of the book's title?

It can be concluded that the assertions in the quote are superficial and selective at best. On the one

⁴⁹ *Essentials of Strategic Management- The Quest for Competitive Advantage*. Third Edition. John E. Gamble (University of South Alabama), Arthur A. Thompson, Jr. (University of Alabama), Margaret A. Peteraf (Dartmouth College), McGraw-Hill- Irwin. 560 p., 2012, ISBN 978-0078029288. The author is grateful to dr. H. Zandvoort for drawing attention to this book. According to p. x of the preface «Our coverage of business ethics, core values, social responsibility, and environmental sustainability is unsurpassed by any other leading strategy text.» The names of the authors are printed at the end of the preface.

⁵⁰ According to the webpage of the publisher and the preface.

⁵¹ On pp. 188-9.

⁵² See the Chronicle. It could be added that HUD did so in order to realize the American Dream of one President after another.

⁵³ Responsibility b of the Fed: «supervising and regulating banking institutions, to ensure the safety and soundness of the nation's banking and financial system and to protect the credit rights of consumers.» Cited in the Chronicle.

hand the unethical behavior of banks is “obviously” caused by greed. On the other hand the need for finding the cause of the unethical behavior of supervisors and governments does not arise, since their conduct is simply ignored. The evidently frequent breaching of codes of conduct is ignored as well, once more making explanation unnecessary. Scientifically speaking the analysis is grossly inadequate. As part of a textbook its one-sidedness gives the students an incorrect and potentially fatally deficient picture of reality. In a more general practical sense, it is a guarantee for repetition.

4. The education and science of law.

In the discipline of law it is even worse. The following is the summary of my article *The science of law, an evaluation*.⁵⁴ In 2006 the article was submitted for publication in the Dutch Jurist Magazine (Nederlands Juristenblad), a widely circulated weekly for everyone with a law training or interest in Dutch law. It was meant as a contribution to the then current discussion about the scientific character of the (hypothetical) science of law. The editor requested shortening, but after shortening the article was not accepted either. No reasons were given. The article enumerates characteristics of “scientific” books and papers in law which are incompatible with the norms of science. The following is a summary.

«On the basis of quotes of key paragraphs [this paper shows] that as a rule, publications in the science of law do not satisfy elementary conditions of logic and science. [A skeptical, critical attitude is missing systematically]. The most important characteristics of the publications which detract from their scientific character can be summarized as follows:

[...]

What suggests unreliability:

1. Many important assertions have an authoritarian character;
2. Authorities disagree about many important subjects;
3. The reference frame is provincial;
4. Inconsistency is accepted, and sometimes defended explicitly;
5. The science of decision making is virtually unknown;
6. It is assumed that words have a meaning of themselves (need no definition);
7. Conclusions are not drawn, and summaries are not given;
8. The discussion takes place within small margins around the status quo, and the argumentation seems directed at keeping it there;
9. The status quo is defended with fake arguments;
10. In the argumentation errors are made which invalidate the argument.

What is missing:

11. Substantiation of assertions about facts;
12. Awareness of [unjustified] suffering caused by the law;
13. Analysis of the motivation and making of the law;
14. Awareness of the relation between law and politics;
15. Attention to the [practical and factual] development of law;
16. Attention to law in general education;
17. Efforts at ordering the set of norms and values;
18. Universalism, skepticism, criticism and disinterestedness.

[...]

These and other characteristics not only hinder progress in the field of law, but social progress as well.

[In the article] recommendations are made to improve the scientific character of the “science” of law. Such as:

- systematically distinguishing between law and politics;
- distinguishing between education programs for professions requiring a law study and programs for law scientists;

⁵⁴ In Dutch. The article can be found in the directory Miscellaneous, under 20110826.

- introduction of the subject law in all levels of education.»

Due to the lack of a scientific attitude in law education and literature, especially the science of law, but also the education of law, leave very much to be desired. And there are even more reasons than mentioned above. Quite often judges have shown not to have the slightest idea of probability calculus and statistics, and of physics, chemistry and biology, when acquaintance with these sciences is absolutely necessary to be able to judge a suit reliably and responsibly. Furthermore, the grounds of the claim that judges have a good knowledge of men, and can reliably find out for example whether the accused is simulating, are entirely unproven. In fact, there is empirical evidence showing that they do not have this knowledge, and let themselves be misled. In several cases concerning risky new materials and pollution judges swallowed the “wir haben es nicht gewußt” (we didn’t know) of experts from Philips Duphar to Chemie-pak.⁵⁵ This shows that they never had real contact with natural sciences and scientists,⁵⁶ and do not understand them. It is simply nonsense to think that an expert natural scientist doesn’t know that this or that is risky, and will consider safe what isn’t or is unknown. He understands probability and statistics, and knows that certainty is extremely rare. A judge could and should know that any expert is aware of that. Anyway, it follows that in the mouth of an expert, “we didn’t know” is either downright nonsense or intentional deceit. “Know” is indeed too strong a word if there is a probability of less than 100% of danger, and if consequences may depend on circumstances.

Like teachers, the vast majority of judges spent their lives in education institutions and law courts. They lack practical experience in other social environments. As a consequence, many of their ideas are not based on reality but on untested hypothetical theories or illusions.

5. Closing remark- Supportive evidence from *Inside Job*.

The documentary film *Inside job* gives very relevant and rather unique information about university economics. It shows that even economics departments of the most prominent universities do not require staff to disclose the names of parties which subsidize research or researchers in the publications reporting on subsidized research. The film includes an interview with John Campbell, chairman of the Harvard economics department, explicitly saying this. Campbell denies similarity with a doctor prescribing medication produced by a company he invested in. Campbell pretends to see no conflict of interest.⁵⁷ Whatever he says, the policy means that possible conflicts of interest remain invisible, and that disinterestedness is suggested where specific interests are served. The film also gives an example of a “scientific” article which gave a positive evaluation of the financial situation of Iceland:

«The [Icelandic] economy has already adjusted to financial liberalization, which was already completed a long time ago, while prudential regulation and supervision is generally quite strong.»⁵⁸

The evaluation was unfounded. It was based on no more than hearsay, and paid for by the Icelandic Chamber of Commerce.

7B.3. Risk, rating, risk management and liability.

Table of contents of this section.

1. Introduction and some conclusions.

⁵⁵ Well known major Dutch cases. Other examples are given in chapter 8.

⁵⁶ Which for convenience is assumed to include mathematics and mathematicians. Mathematics being an essential instrument for the exercise of these sciences, and of course, a very valuable discipline in itself.

⁵⁷ Which is possible only by denying the dictionary definitions of words. I.e.: it is possible only by lying.

⁵⁸ The photo of a reference to this paper, with the “stability” in the title replaced by “instability”, also shows that the paper is from 2006. The text of the paper above the quote shows complete lack of understanding of “instability”: «There are three traditional routes to financial instability that have manifested themselves in recent financial crises: 1) financial liberalization with weak prudential regulation and supervision, 2) severe fiscal imbalances, and 3) imprudent monetary policy. None of these routes describe the current situation in Iceland.»

2. The concept of risk: probability and consequences.
3. Classifications of risks in financial institutions.
4. Decision making, liability and criminal law, and risk management.
5. The lack of understanding of the fundamental position of supervisors as regards information about (systemic) risk.
6. The undiscussed hypothesis of the social benefits of unlimited freedom of risk taking.
7. The inquiry commissions don't show understanding of fundamental difficulties in rating and dealing with risks.
8. Another example of a dangerous lack of understanding: of "mathematical models".
9. More explanations of failing risk management and reckless behavior.
10. To conclude: the wider implications of the observed phenomena.

1. Introduction and some conclusions.

The Chronicle of the crises shows that for many years, all principal persons in supervision and government have taken unbearable risks. They did not fulfill their (legal) duties, and behaved irresponsibly.⁵⁹ But they have not been held accountable and have not been criminally prosecuted. Often their careers have progressed as if they had functioned excellently and no crisis had ever occurred. The immense costs of the crises are borne for almost 100% by innocent people.

Analysis of the history and legal background of the decade before the crises shows that the principal persons had insufficient reasons to do what their duties required. Government officials had no reason to supervise supervision properly, and no reason to create a safety net for the case that their assumptions would turn out to be erroneous. All mechanisms intended for control failed completely. One of the most important conclusions of this study is, that the supposed mechanisms for self correction in the political systems of the present world simply do not work at all. The existing political systems completely fail to correct themselves.⁶⁰ It is hard to believe that this will not lead to even greater disasters.

The present section shows that risks and risk management were handled irresponsibly and incompetently. There is no evidence that shows that the principal persons had an adequate understanding of risk and risk management. On the other hand there is ample evidence which unambiguously shows a lack of understanding.

Meaningful risk management is only possible if the consequences of realization of risks are known, at least approximately. Where "the consequences" means: all relevant consequences. But due to deficiencies in criminal and liability law, and the conduct of supervisors, the consequences of misconduct of financial institutions and supervisors for the people who were responsible for that misconduct, are obscure, and to a large extent arbitrary ("discretionary").⁶¹ Most misconduct in and around the financial system goes unpunished. The people responsible for the suffering of millions are not held liable. Instead, they are allowed to keep on living excessively well off the profits of building castles in the air. The problem is mentioned by the inquiry commissions, but analyzed superficially at best, and not in such a way as to help finding solutions or useful recommendations.

The inquiry commissions conclude that the supervisors and principal persons acted irresponsibly and failed to do their duty. But the commissions do not try to find the causes of the misconduct. They don't ask themselves what can be done to make supervisors and principal persons act responsibly and do their duty. The answer is nevertheless simple. At least if it is not accepted that innocent people are victimized by avoidable behavior of other people. (Present reality being, that only the personal

⁵⁹ In the hearings of the inquiry commissions they did not account for actively misleading the public and for omitting to take necessary action.

⁶⁰ The political systems were very successful in blaming the financial system, and diverting attention from their own responsibilities, actions (deregulation, affordable housing) and omissions (supervision of supervision, thinking before doing). See for example the explanations of the subprime crisis in the textbooks *Economics* and *Essentials of Strategic Management* discussed above.

⁶¹ Most events are the result of more than a single preceding event, or a single phenomenon. It may be difficult to establish the (quantitative!) contributions of the relevant causes to a given loss. Although it may be rather easy if a single party could and should have prevented the loss. In other words: sometimes an easily solvable problem may be presented in an unsolvable way.

interests of authorities are inviolable). The logical consequence of this norm is, that those who caused harm are responsible for reparation or compensation, and are punished if they cannot repair or compensate. This is a solution for both the problem of irresponsible behavior and that of shifting costs to innocent people. In addition the solution provides a safety net and realizes equality of adjudication with respect to liability and criminal law. Which can be considered as a sufficient reason on its own.

A relatively large part of the blame for the subprime crisis has gone to the rating agencies. But whatever errors they may have made, it seems they did not violate the law. In other words: if they are to blame, so is the lawmaker. Another problem with blaming the rating agencies is, that neither before, during or after the crisis anyone explained what a good rating looks like, and formulated norms or a guidance for ratings. Rating is related to forecasting, and has fundamental and practical difficulties and limitations. No document in the dossier shows any understanding of these difficulties or limitations. The problem is not even noted. It is easy to say that certain ratings are no good, but something quite different to even define a feasible, good and useful rating, let alone produce it. If the assumptions which were made for a specific rating are listed as completely and explicitly as possible, then nobody will find the rating useful. Furthermore, even the best possible rating will change with at least some kinds of changes in the environment. Because of the instability of the financial economic system large uncertainties are inevitable. Changes in laws and lack of supervision may add to the uncertainties. In the present circumstances it is impossible to expect much of ratings.

It has been said, without adequate substantiation, that better ratings would have prevented the crisis. This assumes that “better rating” is well-defined, and that warnings about risks are heeded. Some people undoubtedly do, but the question is: would that have been sufficient to prevent a crisis? Were irresponsible actors not sufficient to cause a crisis? The GSEs felt forced to increase their risks in order to realize the AH-goals, and warned about the possible consequences for profitability, but HUD didn’t mind.

Clearly without liability or limits on acceptable risks better ratings cannot be expected to have a sufficiently large positive effect.

Finally it is noted that in none of their annual reports did the supervisors describe how they defined and supervised the risk management by the financial institutions.

2. The concept of risk: probability and consequences.

In this study the concept of risk is defined as the probability that a specified harmful event takes place, or that the event takes place in a given period. The risk may be time dependent. It may for example increase in time, as a consequence of increasing uncertainties.⁶² In both cases it is unknown if and at what date and time the risk will be realized (= the event takes place). The event may never take place at all. In practice furthermore many things can go wrong more or less independently. Then the resulting risk is the “sum” or the aggregate of the relevant risks. “Sum” between quotation marks because the summation in general is not as simple as adding 1 plus 1.

A living being may die any future year. For every age it has a probability (risk) of dying. The probabilities per year may differ. It is certain (only) that it will die within 200 years.

Bridges are built in such a way that the probability of collapse within say 30 years is extremely small. There is a probability per year, but that probability is very much smaller than the probability that I will not be able to pay the interest on my loan next year.

It is important to distinguish between knowledge or understanding of a risk and knowledge of the date of its realization. These are two different things. The risks may be known and understood, but the time of realization a mystery. Financial economic bubbles are a very important example. In hindsight it may be funny to speak of an internet or housing bubble and the bursting of the bubble. But it is something very different to forecast the week, month or even year of the maximum of the S&P 500, or the bursting of a bubble. It is one thing to know what risks the financial system is running, and something else to be able to predict when exactly it will run out of control, and to what extent.

⁶² The definition is in agreement with the Merriam-Webster of 2002. Except that Merriam-Webster (significantly) says nothing about the dimension time. It speaks of risk in the abstract, not about risk “per unit time”, and apparently time independent.

The use of the concept “risk” in (“professional”) financial and economic practice is dangerously sloppy. In general the dimension time is neglected. One speaks of changing risks, but not in terms of time dependent risks. In financial and economic practice, taking account of risks seems to mean: taking account of the present risks in the present circumstances. That is: taking account of what can happen in the present world. Not in the possible circumstances of a few years hence. It seems to be assumed that the world will remain the same.

The level of thinking can be illustrated with a quote from the hearing of Van Wijnbergen by the Dutch inquiry commission De Wit. In the quote, Van Wijnbergen asserts that all central bankers, with the exception of Trichet, act on the basis of a deficient risk-concept. He warns of the danger of this deficiency:

«What is the use of a buffer? When the weather is bad, you use it, when the weather is good you fill it. The system of capital requirements works quite the other way around. The way it works gives banks more room for taking risks if they perform very well. That is exactly when you would like to rein them in. We heard mister Wellink say: the buffers should be filled. So when the weather is bad you are supposed to supplement them. That is destabilizing. Trichet is the only central banker who seems to understand. Around that time he said: to me this seems a bad time for bigger capital buffers, now you should use them. We call that [requirement to supplement in bad times] procyclical, instead of anticyclical. The system is procyclical. Which means that it amplifies the [hypothetical!] economic cycle, and that is a real design error. The emphasis laid by DNB on supplementation of capital buffers is actually wrong.»⁶³

In this study, risk management is defined as management aimed at the reduction of risks and/or their potential consequences in such a way that they remain or become reparable and/or bearable. This may mean declining to do things which cause the risk of irreparable harm and/or unbearable costs. Since risks change in time, one should not only take account of the risks of today- as nearly all central bankers are supposed to think⁶⁴ but of all possible risks in the foreseeable future.⁶⁵ And at a time when it is possible to take them into account. In bad times it may be too late.

For this reason Basel III proposes a counter-cyclical buffer, of at most 2.5%:

«The amount of the counter-cyclical buffer will range from 0%-2.5% of risk-weighted assets. The exact amount of the counter-cyclical buffer will be decided by national regulatory authorities and will generally be determined by the amount of credit in an economy, with more credit leading to a higher buffer.»⁶⁶

As noted, risk is defined as the probability of a specific event. But what really counts in practice are the consequences of this event, and especially the harm it causes or represents. The reason for the definition is the clarity it offers, especially regarding the distinction between different aspects. The risk may be clear and unambiguous, while the consequences may be endless in space and time, and difficult to trace and describe. It may be unclear whether certain consequences can be ascribed to the event under consideration, or- partly- to unrelated other causes. Distinguishing between risk and consequences will not however prevent the incidental adoption of the terminology “large risk” of common parlance not for a large probability, but for large potential damage. Even if the probability is small.

In practice risks are always estimates. The true risk can be larger or smaller. In general it is larger. The reason being that there is no reliable method for finding all the risks. One never can be sure of having found them all. Experience shows that there are always risks which have been overlooked. Sometimes risks that could have been known, sometimes new risks. In the course of time the risks people are exposed to have changed. Many health risks have decreased. But many other risks have increased due to the growth of the world population, economic and technological development; in

⁶³ Hearing reports CDW1 p. 25.

⁶⁴ Please remember that together they have tens of thousands “expert” employees (advisors...).

⁶⁵ This regards both the qualitative and quantitative dimensions of risks. New risks may arise, and old ones may become smaller or larger.

⁶⁶ Joe Larson, *The Basel Capital Accords*, April 2011, pp. 25-6. The 2.5% lacks any objective basis.

combination with laws which permit risk taking with impunity. Practically if not theoretically. Both in an absolute and a relative sense many more people than a century ago are confronted with consequences of human error and misconduct, and risks created by people.

The estimation (ideally measurement) of risks, that is: of the size of the probability per year (or some other unit of time) for a specified event to happen, is difficult. It is a kind of forecasting. Much more is possible than is acknowledged by governments and by dependent people and organizations. But forecasting remains very imperfect, especially as regards social and economic developments. It is nevertheless evident that there are many risks whose realization will cause unprecedented numbers of victims. In the chapters 21 and 22 of its report, the FCIC paints a dramatic picture of the consequences of the subprime crisis.⁶⁷ But the FCIC does not try to find out what prevention of this misery would require of risk management and the law. This will be elucidated in following subsections.

In an unstable system even a small risk per unit time can be sufficient to destabilize the system. If fluctuations occur, and the risk refers to the probability of a fluctuation being sufficiently large to destabilize the system, the risk can be interpreted as inversely proportional to the time at which destabilization will occur. Those asserting that the financial crisis was caused by small risks, which “everybody thought” would never be realized, thereby show that they do not understand the concept of risk, and never seriously studied the financial economic system.

3. Classifications of risks in financial institutions.

Summary and conclusions.

1. Financial institutions distinguish the following (“technical”) risks:
 - a. credit risk (exposure to loss resulting from a counterparty’s failure to meet its financial obligations. Say to pay interest or pay back a loan);
 - b. market risk (adverse movements in the price of a financial asset or commodity, including changes in interest rates);
 - c. legal risk (an action by a court or by a regulatory or legislative body that could invalidate a financial contract);
 - d. operations risk (inadequate controls, deficient procedures, human error, system failure, or fraud).
2. Lobbying and relation management can be seen as a part of risk management, aimed at reducing the risks caused by supervision and changes in regulation, in particular of liability and criminal law.

With the exception of its last paragraph, this subsection is somewhat technical. It is meant to give an impression of the way in which people in financial institutions thought (and think) about risks.

In financial institutions, risks are distinguished according to nature and/or origin:

«The risks posed by derivatives use include

- (1) credit risk (as defined earlier: derivatives credit risk is the exposure to the possibility of loss resulting from a counterparty’s failure to meet its financial obligations);
- (2) market risk (adverse movements in the price of a financial asset or commodity);
- (3) legal risk (an action by a court or by a regulatory or legislative body that could invalidate a financial contract); and
- (4) operations risk (inadequate controls, deficient procedures, human error, system failure, or fraud).

These general types of risk exist for many financial activities, but the specific risks in derivatives activities are relatively difficult to manage, in part, because of the complexity of some of these products and the difficulties in measuring these risks. For example, because derivatives might be used

⁶⁷ See also *Inside Job*. Don’t forget Iceland.

in conjunction with other assets and liabilities, measuring the extent of market risks of derivative products alone is not sufficient to understand firms' total market risk.»^{68, 69}

The same distinction is also made in annual reports. In that of Freddie⁷⁰ about 2006 one reads for example:

«Risk Management

Our portfolio investment and credit guarantee activities expose us to three broad categories of risk:

- (a) operational risks,
- (b) interest-rate and other market risks, and
- (c) credit risks.

Risk management is a critical aspect of our business. Effectively managing risk enables us to accomplish our mission and generate revenue and long-term value.»⁷¹

Freddie distinguishes two types of credit risk:

«Mortgage credit risk is the risk that a borrower will fail to make timely payments on a mortgage or security we own or guarantee. Institutional credit risk is the risk that a counterparty that has entered into a business contract or arrangement with us will fail to meet its obligations.»⁷²

Freddie describes its risk management on pp. 56-80/68-92. It looks impressive, but weak points are easily found. Two examples from p. 78/90:

«*Credit Risk Sensitivity.* Our credit risk sensitivity analysis assesses the assumed increase in the present value of expected single-family mortgage portfolio credit losses over ten years as the result of an estimated immediate 5 percent decline in home prices nationwide, followed by a return to more normal growth in home prices based on historical experience. [...]»

Mortgage Loan Insurers. We have institutional credit risk relating to the potential insolvency or non-performance of mortgage insurers that insure mortgages we purchase or guarantee. We manage this risk by establishing eligibility standards for mortgage insurers and by regularly monitoring our exposure to individual mortgage insurers. We also monitor the mortgage insurers' credit ratings, as provided by nationally recognized statistical rating organizations, and we periodically review the methods used by the nationally recognized statistical rating organizations.»

The results of the credit risk sensitivity analysis can be found on p. 93/105 of the annual report. There is no indication that more than direct consequences have been taken into account. While it is evident that a 5% decline must have many more effects, for both Freddie and its business partners. And such a decline has causes too.

It is not clear what is assumed about “normal growth”, and “historical experience”. In both cases, the assumptions may be no more than wishful thinking.⁷³ It is doubtful whether a reliable risk analysis may assume that in the end (=?) everything will remain as it was. In historical perspective, crises (and revolutions) are normal. And major crises are never solved quickly.

It is unclear whether the “manage” in the paragraph “Mortgage loan insurers” represents something effective. It doesn’t seem so. Especially questionable is the assumption that the insurers will not have problems when Freddie has. Namely because Freddie is very large. Therefore it seems highly implausible that nobody else has problems when Freddie has. Correlation of problems seems much more plausible. The only question is: how large is this correlation? It may depend on the cause of

⁶⁸ GAO 1994 pp. 9/11 and 4/6 (definition credit risk). The AR 2006 of Freddie calls this “derivative counterparty credit risk”, see p. 64/76 of that AR. A useful overview is also given by: 19940731_Risk management guidelines for derivatives_BIS-bcbsc-211.pdf. Although questions may be asked about the feasibility of the norms proposed by this report. Is possible what this report considers proper, or what it requires? Can the proposed models be developed at all? If so, can their reliability be guaranteed? Can this be done for costs less than the total benefits?

⁶⁹ Note that this may make rating a separate product difficult or impossible.

⁷⁰ The choice of AR 2006 of Freddie is arbitrary, and is not intended to suggest that Freddie did better or worse than others. Except that the year was chosen for two reasons: 1. well before the crisis (to maximize independence of the crisis); 2. close to the crisis (to maximize relevance).

⁷¹ Freddie Mac Annual report 2006 p. 26/38.

⁷² Freddie Mac Annual report 2006 p. 66/78.

⁷³ In other words: this obscurity is a major risk for a shareholder.

Freddie's problem.

Another paragraph raising questions is the following:

«To date, we have not incurred any credit losses on OTC derivative counterparties or set aside specific reserves for institutional credit risk exposure. We do not believe such reserves are necessary, given our counterparty credit risk management policies and collateral requirements.»⁷⁴

The text shows that Freddie relies for 100% on its preventive policy. It assumes that this policy is 100% effective. It is not clear however what will happen if its assumptions prove to be too optimistic. Since the assumptions seem to exclude circumstances found in many historical situations, and ignore the GAO, CGFS and OFHEO mechanisms and scenario's, a contemporary reader had plenty reason for skepsis.

A connection with available capital (very little!) and/or available reserves is not laid. It is not explained what risks the available capital allows Freddie to take, and/or what events it can cope with without outside help.

The obligation to make an annual report presents an integrity problem to a management. On the one hand annual reports should give a truthful account. On the other hand the management wants to give a good impression of its performance. It wants to inspire trust. In the present day management culture, the management knows, and doubts not. It is always right, and therefore defensive. (As if in permanent fear of its position). This situation creates uncertainty for outsiders. They cannot be sure of what lies behind the façade. Whether the self-confidence of the management is justified, or overly pretentious. In the present example, the critical outsider cannot escape the conclusion that Freddie's risk management is inadequate. Mainly because its assumptions are unrealistically optimistic: they ignore both historical experience (such as crises), and fully ignore scenario's as sketched by the GAO in 1994-1999 and OFHEO's systemic risk report of 2003.⁷⁵

Finally it should be noted that the risk perception of financial institutions may be erroneous, and that the financial institutions are not open about all of their risks. They may see as a threat what may turn out to be a blessing, and vice versa. Important risks are caused by supervisors and governments. For the financial institutions, much depends on the quality of supervision. Changes in regulation may cause significant costs. Especially changes in liability law which would increase the liability of corporations and the personal liability of their principal managers. For these and similar reasons, lobbying and other forms of relation management can be seen as part of the risk management of financial institutions. If one does, and if one adds up the consequences of the subprime crisis for the financial system, one can only conclude that in general the risk management of the financial institutions, and even more that of their managers, was very effective.

4. Decision making, liability and criminal law, and risk management.

Summary and conclusions.

1. Because of shortcomings in liability and criminal law, and because of skewed remuneration systems, employees of financial institutions had no compelling reason to take risks seriously. They had good financial reasons to choose the most profitable opportunity, irrespective of external costs and risks.
2. There wasn't even good reason to find and analyze risks.
3. Strict liability and criminal law are crucial boundary conditions for effective risk management. Strict and personal liability and criminal law will cause avoidance of unbearable risk, while allowing for risks of which the consequences can and will be repaired or compensated.
4. Capital requirements, including those of the Basel accords, seem to be intended to preclude liability and crimination. But it is evident a priori that they can only do so to a minor extent.

⁷⁴ Freddie Mac Annual report 2006 p. 66/78. The counterparty credit risk management policies are outlined on pp. 64-5/76-7. Note that the value of collateral may depend on market pricing.

⁷⁵ OFHEO= Office of Federal Housing Enterprise Oversight.

- Which is confirmed by the crisis.⁷⁶ The capital requirements are fundamentally inadequate.
5. If good or effective risk management is defined as management effective in reducing risks and their potential consequences to such an extent that they are bearable, then the risk management of the financial institutions that went bankrupt, and only theirs, was not effective. But supervisors or governments never defined specified norms for “good risk management”, and set no limits on risk taking. They did not try to ensure that liability and criminal law had a preventive effect. They effectively gave financial institutions a free rein, and allowed the bill for disasters to be passed on the innocent general public.
 6. The financial institutions had and have no good reason to be substantially more careful in their risk taking. But because of the competitive environment and the possibility of large profits, they did and do have reasons for taking large risks.
 7. The inquiry commissions blame financial institutions for inadequate risk management. But they do not point out that regulatory limits on risk taking are missing, and that a competitive environment stimulates risk taking. They do not mention any binding norms, and seem to base their reproaches on vague moral considerations. They fail to note that financial institutions (and other people and organizations) can take “too much” risk with impunity, and often are not effectively liable.
 8. The CDW and FCIC do not try to find the causes of the supposedly inadequate risk management, and do not analyze the influence of liability and criminal law. Even though they were asked to find the causes of what went wrong.
-

One could say that the subprime crisis was caused by taking too much risk. For if something goes entirely wrong in a sequence of events which lies within the bounds of what is theoretically possible, and which is similar to a sequence that unrolled before, then by definition too much risk was taken. In other words: the risk management was insufficient. Risks were taken directly by people buying a mortgage⁷⁷ and by financial institutions. Other kinds of risk were taken (indirectly) by supervisors and governments. Where it should be noted that only a minority of the mortgage buyers, many of the mortgage sellers, and all supervisors and governments took too much risk.

Mortgage sellers in the US reduced mortgage requirements to such an extent as to increase the risks to an unprecedented level. It was evident that an increase in the interest rate and/or fall in home prices would inevitably lead to problems. Unbearable risks were also taken in the trade with mortgage backed securities and securities related to them. On such a scale that systemic risk was caused. Inevitable developments or fluctuations would start processes which could bring the financial system to a complete standstill. Supervisors and governments systematically ignored information and recommendations about systemic risk. Nothing was allowed to block deregulation and affordable housing policies. Supervisors and regulators simply failed to do their duty.⁷⁸ Their reassuring bragging was unfounded nonsense.

After the crisis had become a fact, the risk management of financial institutions was severely criticized. The FCIC has shown that some institutions didn't take risk management seriously. Obviously this is only possible if supervision fails as well.⁷⁹ Sometimes a risk manager was only appointed because it was required by regulation. It is clear that financial institutions took risks they couldn't bear. Their risk taking was lawful however. It was in accordance with regulation, and tacitly permitted by the relevant supervisors.

The reports of the inquiry commissions do not say what risk management should look like, and

⁷⁶ And of course, the authors and supporters can always say that the last version solves all remaining problems. They have nothing to fear when this turns out to be untrue.

⁷⁷ In 1990-2005 the percentage of bad mortgages grew “exponentially”: much faster than linearly. See for example the histogram on p. 45 of the report *Housing at the tipping point* of Zandi et al. of Moody's economy.com (in the dossier), and the histogram on p. 9 of the FCIC staff-study *The mortgage crisis*, also in the dossier.

⁷⁸ The concept of regulators comprises both supervisors and government.

⁷⁹ Warnings had been given. On p. 9/11 of the GAO report of 1994 one reads: «Regulatory examinations of the major bank dealers that were done from 1990 through 1992 identified some serious weaknesses in these dealers' risk-management systems, such as failure to set or follow risk limits.»

why. They don't say what risks are prohibited and for what reason. On the other hand they do suggest that 100% safety is undesirable because it would hinder "real economic activity". But if no limits are set for risk taking, if liability of institutions and employees is absent or minimal, and if there is competition, then it is only logical, if not necessary for survival, that unbearable risks are taken. In such an ("self regulatory") environment there is no coupling of the external consequences of actions of employees with their own well-being. In particular no coupling that necessitates careful consideration of risks, and rejection of unbearable risks. This is explained in the following.

"Taking too much risk" means: taking too much risk in decision making, or when making a choice between different alternatives. By definition in the framework of risk management.

For an important part, risk taking can be discussed in the context of decision making. This has a great advantage, since decision making is a very general process. Every conscious action or omission is preceded by decision making. Analysis of decision making often yields results which are also applicable to decision making in other fields. For this reason we take a closer look at decision making.

Decision making is a process for making a choice between a number of alternatives.⁸⁰ Where an "alternative" can be an activity, a product, a proposal, or something else one can choose. Each alternative has consequences. Partially known, partially unknown. In general there are possibilities and risks.

Suppose that each alternative may have a limited number of potential consequences, that these potential consequences are known, and that the consequences can be appraised with money. Then a specific consequence has a monetary value. The value can be positive or negative. In the last case one can speak of costs or damage. Suppose furthermore that it is possible to estimate the probabilities of the realization of the different potential consequences. Because of the meaning of the concept probability, the expected yield of an alternative is the sum of the products of the probabilities and values of the consequences.

If all costs of all potential consequences of each given alternative are bearable and payable by the actor/decision maker, then the actor can optimize his results by choosing the alternative with the greatest expected yield. In that case the choice is easy because he can do this without running the risk of going bankrupt or something equivalent.⁸¹ The choice is difficult however if the alternative with the greatest expected yield is coupled to risks with unbearable consequences.⁸² What to do then, and why? Can the choice be accounted for, and if so, how?

In the years before the crisis risks with unbearable costs have been systematically underestimated or ignored. Many people and organizations acted as if only the best possible consequences would come true.⁸³ Only more or less direct risks were taken into account, and not necessarily in an adequate way.⁸⁴ They were underestimated by assuming that circumstances would not change more than what was considered probable, reasonable or whatever. Systemic effects, that is: cumulative indirect effects, and worst case scenario's assuming evaporation of trust in types of securities, were ignored. The GAO reports of 1994-1999 and OFHEO's systemic risk report were ignored. The principal persons "forgot"

⁸⁰ The decision making procedure presented here can be called optimal decision making. It is optimal as measured by the (subjective) norms and values of the decision maker. In the literature it is sometimes called rational decision making. But in the opinion of the present author the only meaningful definition of "rational" is: consistent. That is: consistent with experience and reliable knowledge. For this reason, the word "rational" is superfluous, and is not used in this study.

⁸¹ This is the case when you invest your own money, as long as you don't strictly need it for your livelihood. If your investments lose all of their value, you lose everything, but don't harm anyone. And you do not even indebt yourself. Banks nevertheless advise investing in a mix. Which doesn't give the maximal yield. At least not for the investor.

⁸² Note that the situation is not symmetric: profits can always be cashed by the actor, irrespective of their size. But an actor can only bear limited losses, the remainder is automatically rolled off. And there is also the possibility of irreparable damage, such as people being killed or handicapped.

⁸³ Or that the government/taxpayer would help out in the case of realization of an unbearable risk. One speaks of "moral hazard" if politicians or government officials suggest that the government will act as a safety net for certain calamities.

⁸⁴ As we saw in the case of Freddie.

⁸⁵ moreover that not only the probability matters, but in the first place the product of probability and consequences.⁸⁶

Additional difficulties for making estimates of consequences and risks are the instability of the system, and the fact that major negative consequences inevitably cause many different effects, and not only in the financial system. Social and economic effects seem hard to predict.⁸⁷ Furthermore there is no generally accepted method for measuring the misery inflicted on innocent victims.

Decision makers may have thought that they could afford to pay little more than lip service to risks and risk management because they thought that there was no reason to fear liability and/or punishment. The facts have shown that this notion was correct. Perhaps they also thought they could rely on the quality of regulation and supervision, and in case they would be held accountable, on the excuse that they thought they might rely on that.

The above seems to be a sufficient explanation of the conduct of the principal persons. If there is no obligation to repair or compensate damage caused, then the corresponding risks do not need to be addressed (or only partially). One is free to take risks at the potential cost of outsiders. Especially in the case of an alternative combining large potential profits with the risk of unbearable consequences.

If however contrary to the present law, innocent outsiders have to be safeguarded from undesired effects of the activities of other people, then all potential costs of a chosen alternative should be payable with the available capital.⁸⁸ Including the costs of “improbable” consequences. And this applies not only to separate decisions and activities, but also to the sum total of the activities of an institution. Not only the potential costs of any given activity should be bearable, but also the sum of the potential costs of all activities taken together.

From the above it follows that the limitations of liability and criminal law, in combination with insufficient supervision and other norms, can fully explain the taking of unbearable (“irresponsible”) risks. Adequate liability and criminal law are crucial conditions for effective risk management. Strict and personal liability and criminal law will cause avoidance of unbearable risk, while allowing for risks which can and will be repaired or compensated.

The effect of deficient liability and/or punishability is amplified by a corresponding skew remuneration method. Namely a remuneration method which gives a decision maker/ risk taker a bonus or gratuity in case of positive results, without similar deduction or fine in case of negative results (including those for outsiders). Under such conditions there is no need to weigh costs and benefits without bias. On the contrary: it is advantageous to chose the alternative with the largest potential profit, and to disregard costs and risks for outsiders. The consequences for the decision maker(s) are effectively decoupled from those for outsiders.

The inquiry commissions mention compensation systems and bonuses as a contributing cause of the crisis.⁸⁹ This means that they acknowledge the influence of financial incentives. Nevertheless neither the commissions nor others note that the observed (inadequate) risk management would have been extremely improbable if liability and criminal law had been much more strict and personal. They don't note that liability and criminal law (may) have a decisive influence on risk taking. And that the given law does not give reasons to take less risk, or manage risks differently, than in the decade before the crisis. In the preceding paragraphs this was argued theoretically. The events of 2007-2013 support the theory.

With its conclusion and other remarks the FCIC suggests that the risk management should have been more strict. But it does not explain why an organization would take less risk under unchanged liability and criminal law. There is no indication at all that the detested risk management was

⁸⁵ It is unclear what would be the correct or best word. That depends on the integrity and competence of the principal persons. “Forget” assumes sufficient knowledge. What evidence is there for that assumption?

⁸⁶ For example in the discussion about “tail risks”. See the hearing of Wellink in CDW1 and the speech of Geithner in NYC 28 February 2006.

⁸⁷ Seem: historical experience shows that the prediction: “ultimately nothing will change” is very reliable.

⁸⁸ The fundamental norm implies that causing irreparable damage is strictly forbidden. It can only be allowed after explicit approval of everyone concerned, after full and correct information. See for example *The law of logic*.

⁸⁹ FCIC report p. xviii/18 and CDW1 section 5.4 on pp. 76/73 and following.

incompatible with any law or regulation. It therefore follows that the FCIC implicitly concludes that liability and criminal law were (are!) too lax, and should be more strict. But it doesn't state this explicitly.

Notwithstanding the fundamental importance of risks and risk management, the inquiry commissions gave them only superficial attention. Nothing is said about the meaning of "good risk management". As if it is evident what "good risk management" requires.⁹⁰ But perhaps also because serious discussion would reveal that economists and (other) politicians prefer a fundamentally unsafe system, and don't really mind about the risks for the overwhelming majority of the population. For example because they assume that risk taking is necessary to keep the economy going or growing. In combination with an inability or unwillingness to explain or defend such an assumption, and an inability to understand that strict liability does not preclude risk taking. After having read the Chronicle and the section on education, the reader will understand that their assumption is based on quicksand and/or fantasy. Of course, in a democracy it is unacceptable that such crucial assumptions are not accounted for in public.

The FCIC majority concludes that "[risk management at many systemically important financial institutions were a key cause of this crisis](#)".⁹¹ The CDW recommends "supplementation and sharpening" of, if you please, the "Banking code". Not a law, but a noncommittal code. The recommendations of CDW are very vague and elastic.⁹² If repetition of a crisis like that of 2008 is to be prevented, or if innocent people are to be safeguarded from damage caused by such an event, then risk management should not only become better but sufficient. "Supplementation and sharpening" need not mean that limits will be set on risks. It should anyway be discussed and decided openly which risks and damage are to be permitted. Without answers to these questions, systems of risk management cannot be evaluated objectively. It should be clear how much risk may be caused for each citizen (not on the average), and to what extent innocent citizens may be duped, for example by loss of job or loss of a retirement pension. And of course why. Why stealing is forbidden, and causing risks like these is permitted. And why a citizen would accept a person or organization to create such risks for him or her.

The inquiry commissions do not describe the consequences of the freedom to take unlimited risk. They are silent about the acceptability of this freedom. Which actually is the freedom to harm innocent people. They do not discuss the problems this freedom causes for individual institutions if there is no effective supervision.

The commissions do not try to find out which set of measures would be sufficient to prevent similar crises. Although it is evident a priori that the effect of vague and elastic recommendations can be nil. In short: as regards risk and risk management they fall so far short of the mark that in this field no improvement is to be expected.

Both commissions conclude that the subprime crisis was caused by avoidable human activities, and that it caused immeasurable suffering and damage. Both commissions fulminate against bonuses and payouts at retirement. The FCIC was established to [«examine the causes, domestic and global, of the current financial and economic crisis in the United States»](#), and the CDW was asked:

[«What are the causes of the recent turbulent developments in the financial system, and what recommendations can be made on the basis of the findings of the inquiry for a more adequate operation of the financial system?»](#). How then is one to explain their complete silence about the problem or impossibility of using liability law to recover damages, and criminal law to punish the guilty, and how is one to explain that they don't mention weaknesses in liability and criminal law as contributing cause of irresponsible behavior?

The inquiry commissions suggest, but don't show, that the crisis would not have taken place, or

⁹⁰ As often, it is possible that some or all of the writers and speakers (in hearings) are simulating.

⁹¹ FCIC report p. xviii/18.

⁹² A recommendation is called elastic if it can mean anything between nothing and very much, depending on interpretation and implementation.

have been far less devastating, if the risk management had satisfied the norms of the time. The problem of the financial institutions may have been that such norms didn't (and don't) exist.⁹³ Already for this reason alone the critical remarks of the commissions about the risk management of the financial institutions are misleading. If it is unclear what good risk management requires, if good risk management means suicide (in the absence of effective supervision), or if there are no credible alternatives for the actual risk management, then the complaints of the inquiry commissions about this management are misleading half truths. The more so if they actually don't want fundamental change, but don't want to say so.

In the chapter on education and sciences the reader has already seen that textbooks in economics and law pay no attention to the influence of (liability and criminal) law on (economic) decision making. The hypothesis that the general welfare is served by limited liability is neither mentioned nor discussed. One may compare this with the attention given to the Iliad and Odyssey.

For a discussion of more general aspects of liability and criminal law the reader is referred to the next section, 7B.4, especially subsection 7B4.3.

5. The lack of understanding of the fundamental position of supervisors as regards information about (systemic) risk.

Summary and conclusions.

1. To ensure compliance with rules which possibly hinder individual institutions but are beneficial for the group, one always needs an independent person or organization with effective supervision as specific duty. Therefore self regulation is a contradiction in terms. A group which wants to regulate itself will install an independent person or organization to ensure compliance.
2. This fact was ignored before the crisis by all supervisors and governments. If they had the competencies necessary for their jobs, they would have known and understood, and not have talked nonsense about self regulation and deregulation.
3. These facts are not mentioned by the inquiry commissions.

The inquiry commissions do not (explicitly) note that the law⁹⁴ does not prescribe "good risk management", and (therefore) does not sanction inadequate risk management. As mentioned earlier, "good risk management" isn't even defined, let alone in a verifiable way. The commissions do not note that risk management is dictated at least in part by liability and criminal law. The law allows enterprises to go bankrupt, and saddle society with their debts. Only in exceptional cases does bankruptcy have negative consequences for responsible employees.

The relevant laws have been decreed on the basis of theoretical assumptions and/or political dogmas. They have never been evaluated in the light of practical experience, including crises. Indeed, the crises can be considered as falsification of the assumptions of the relevant laws. The discussion of this subject will be resumed in connection with liability and punishability.

Probably as a consequence of the superficial discussion of risk and risk management, the inquiry commissions give no attention to the fundamentally different roles of institutions and supervision with respect to risk and risk management. This is an important subject because the total risk for society-including "systemic risk"- may be very much larger than the simple sum of the risks for individual institutions. In the USA, the Fed was responsible for systemic risk. Both the facts and its annual reports show that the Fed did simply nothing about this part of its duties.⁹⁵ Its annual reports should

⁹³ Neither the inquiry commissions nor any document in the dossier says anything about this.

⁹⁴ When only law is mentioned, this concept is supposed to include implied regulation.

⁹⁵ Its head, Alan Greenspan, assumed that this was not necessary. He supposed that self regulation was sufficient. And of course the Fed is a hierarchical organization. With Greenspan as boss, for too many years.

tell what the Fed did about it in the given year. But they are completely silent.⁹⁶ The duties of the Dutch DNB are formulated only vaguely. Because of the national distribution of duties it is nevertheless clear that the treasury secretary is responsible for the system as a whole, either directly or via DNB. Parliament is supposed to be responsible for supervision of both the secretary and DNB.

Because financial institutions have only little information about the finances of other institutions and about the supervisors, individual institutions are handicapped in the calculation of their risks. Much is (very) uncertain. As for the ordinary citizen, who cannot know the financial situation of his bank, and has to rely on the supervisors too. Because of deficiencies in regulation and practical difficulties, the same holds for supervisors, though to a far lesser extent, and in a somewhat different way.

Still, to know the different types of risks, to know what they depend on, and to know their potential consequences one only has to know how the financial system works: with what instruments (products) and how. One doesn't need thousands of numbers per month from each of the financial institutions.

At least the people who are responsible for the conduct of a group of competitors have to know and understand the prisoners' dilemma (see above, in the section on education and science). They should know and understand that competitors may have an interest not only in regulation, but also in compliance with regulation. In other words: if they have an interest in rules, then they have an interest in (effective) supervision. It is simply untrue that rules cause costs and hinder by definition. The question is not: rules or not, but: which rules? Everybody who is responsible for the conduct of a group of competitors must know and understand that self regulation is a contradiction in terms. In a single more simple word: nonsense. The reason being that a group that wants to regulate itself (and is sufficiently competent) will install an independent person or organization to ensure compliance. To ensure compliance with rules which hinder individual institutions but are beneficial for the group, one always needs an independent person or organization with this specific duty.

In spite of this, in the years 2000-2008 many of the principal persons (or their spokespeople) have systematically and explicitly argued for self regulation, deregulation, and less supervision. They abused their power by ignoring critics and trying to silence them. And by refusing to learn.⁹⁷

6. The undiscussed hypothesis of the social benefits of unlimited freedom of risk taking.

Summary and conclusions.

1. In relatively inconspicuous remarks in the reports of the inquiry commissions the chairmen of the Fed and DNB claim that unsafe capital requirements, and therefore the transfer of the larger risks to the general public, is necessary to keep the economy going.
2. No substantiation is given.
3. The assumption is of great practical importance, but discussed by neither commissions nor politics in general.⁹⁸
4. Although only few activities are subject to strict liability, regulation of economic activities in other sectors of the economy allows much less transfer of risks to the general public. This evidently does not hamper their economic prosperity.
5. No other sector of the economy has avoidably caused disasters of the size of the crises caused by the financial sector.⁹⁹

■

In the reports of the inquiry commissions one may find one or two incidental remarks which reveal

⁹⁶ See the Fed appendix.

⁹⁷ See the textbooks in economics and law.

⁹⁸ Neither is it found in the economy textbooks mentioned earlier. Because of its general interest and importance, it should have been discussed.

⁹⁹ Excepting wars, which might be attributed to "the political sector".

a reason why no limits are set on risk taking. The remarks are not discussed by the FCIC, or even noticed explicitly. Neither in any other document in the dossier by the way. In the FCIC report one reads:

«Greenspan [...] said in a 1999 speech that the successful resolution of the 1998 crisis showed that “diversity within the financial sector provides insurance against a financial problem turning into economy-wide distress.” The President’s Working Group on Financial Markets came to a less definite conclusion. In a 1999 report, the group noted that LTCM and its counterparties had “underestimated the likelihood liquidity, credit, and volatility spreads would move in a similar fashion in markets across the world at the same time.” [...] However:] “Policy initiatives that are aimed at simply reducing default likelihoods to extremely low levels might be counterproductive if they unnecessarily disrupt trading activity and intermediation of risks that support the financing of real economic activity.”»¹⁰⁰

But what are “extremely low levels”, and what is “unnecessarily”? How does the PWG know all risks and their consequences, and all benefits? How does or did it measure the costs and benefits? Who gave it permission to weigh these costs and benefits? Why does the FCIC not discuss these crucial questions thoroughly?

Note that Greenspan implicitly asserts that an example can prove a general proposition. This is simply untrue: examples cannot prove general propositions. By definition (of “general”) a hypothesis which is asserted to be generally true can be falsified by a single example. Greenspan didn’t know what he had to know, and mankind does not learn what it can learn and needs to learn to avoid disaster.¹⁰¹

President Wellink of DNB, the Dutch counterpart of Greenspan, told the CDW on 2/12/11:

«You only have to require a capital of 100% and a few other things, and you get a safe system. At the same time however you get an economy that doesn’t work. Therefore you have to find a balance.»¹⁰²

This is an incorrect description of the problem: the balance is not to be found, but chosen. And Wellink does not explain why it has to be chosen in a particular manner, and by bankers. Nobody does. It is furthermore not a fact that one has to find a balance, but an opinion. Moreover, the tacit governmental permission for balancing, and the acceptance of an intrinsically unsafe system are far from self-evident. Traditionally, nobody is allowed to hinder, or cause damage, for others.

PWG and Wellink are misleading in another respect as well. They wrongly suggest that risk taking is impossible in a safe system, and that safety is incompatible with a healthy economy. This is untrue. Under strict liability, risks can still be taken, but not at the cost of other people. Only the possibility of “privatizing profit and socializing losses” is cut off.¹⁰³ Comparison with other types of economic activity shows that the economy will not come to a standstill if enterprises are made liable. And last but not least: does Wellink really want to say that the system works?

As an outsider one would like to be able to trust responsible people to deal seriously with risks and their consequences. One would like them to cause no more damage for outsiders than they can and will repair or compensate. The secret policy of supervisors like PWG and DNB and their governments means that risks for outsiders will remain large and at most partially repairable, and that costs will remain to be “socialized”.

7. The inquiry commissions don’t show understanding of fundamental difficulties in rating and dealing with risks.

Summary and conclusions.

1. The rating agencies made important unnecessary errors. They did not operate in accordance with

¹⁰⁰ FCIC report p. 58/86.

¹⁰¹ Of course, Greenspan may have said things he does not believe.

¹⁰² Report of the hearings of CDW2 (TK 2011-2012, 31980 nr. 62), 2/12/11, p. 1304.

¹⁰³ The summary “privatizing profit and socializing losses” can be found for example in the transcript of the hearing of Greenspan by the FCIC on 7/4/10.

- generally accepted ethical norms.¹⁰⁴ But if their ratings were relative, they cannot be blamed for much of the crisis.
2. “Safest” does not mean “safe”. Even AAA could and should not have been considered safe.
 3. There is no indication that there was a (regulatory) reference frame with norms for ratings.
 4. There was no system for independent quality control.
 5. The ratings are misunderstood or misinterpreted by the inquiry commissions. The misunderstanding may be related to lack of understanding of risk.
 6. The inquiry commissions do not ask themselves what good ratings would look like. They don’t formulate realistic¹⁰⁵ quality requirements, and say nothing about quality control.
-

One of the simplistic misunderstandings about risks is that very small risks will not be realized because they are very small.¹⁰⁶ This idea is completely erroneous. On the average it may take longer for a smaller risk to be realized than a larger risk. But only for some kinds of risks, and on the average. Both a small and a large risk can be realized already tomorrow, or even today. The crucial empirical fact is that risks are realized, if not sooner than later. No significance can be attached to the fact that nothing happened for many years.¹⁰⁷ Think of Russian roulette.

Knowledge about the existence and size of a risk does not imply knowledge of the time it will be realized. This is why it is called a risk: it may, but need not, take place in a specific period. With hindsight one can speak of a bubble, and say that everyone should have seen the implosion coming. But before the turnabout of the prices- for example- one can only guess when exactly the prices reach their maximum and will start falling.

For these reasons it is not fair to accuse a rating agency of bad ratings if a small risk is nonetheless realized, assuming of course that it has been mentioned:

«While BSAM¹⁰⁸ was wrestling with its two ailing flagship hedge funds, the major credit rating agencies finally admitted that subprime mortgage-backed securities would not perform as advertised.»¹⁰⁹

It is incorrect to suggest that rating agencies make predictions about the performance of securities, enterprises or whatever. Even less when circumstances change unpredictably. As when it turns out that supervisors kept ears and eyes closed instead of doing what is necessary to ensure the safe operation of the financial system. Reproaches would be justified if the rating agencies had ignored certain risks, or if estimated risks would be realized significantly more often than their size indicated, and this systematically. In other words: with a statistically highly improbable frequency. But this is not what the FCIC asserts. The FCIC knows that:

«The ratings were intended to provide a means of comparing risks across asset classes and time. In other words, the risk of a triple-A rated mortgage security was supposed to be similar to the risk of a triple-A rated corporate bond.»¹¹⁰

I.e. that the rating agencies estimated the relative risks of one kind of product with respect to the risks of another. The FCIC nevertheless writes about ratings as if the risk estimates were absolute. It does not analyze the rating methods in order to find out whether they were adequate for making comparative estimates.¹¹¹

Consider furthermore that it is generally accepted that all kinds of predictions are adjusted in the

¹⁰⁴ None of the organizations in and around the financial system did, possibly excepting organizations which this study does not mention by name.

¹⁰⁵ Realistic meaning that the requirements can be met at least theoretically. Not everything can be predicted reliably for example.

¹⁰⁶ In general the “very small” is no more than an estimate or even assumption. Often there is no reliable method for the calculation of risks, the events that will follow realization, and the size of these consequences.

¹⁰⁷ One of the mistakes of the supervisors and governments.

¹⁰⁸ BSAM= Bear Stearns Asset Management.

¹⁰⁹ FCIC report p. 242/270.

¹¹⁰ FCIC p. 120/148.

¹¹¹ The assertion that the ratings were relative is consistent with the graph of the ABX-indices in the Chronicle at the turn of the year 2006-2007. The graph contradicts the assertion that the ratings AAA-BBB⁻ are meaningless. It may even indicate that the corresponding ratings were quite good.

course of time. From weather forecasts to predictions of economic growth. The FCIC nevertheless seems to expect or require little less than perfect predictions. But it didn't ask itself what such predictions could or should look like. It ignores the problem that a responsible rating should be heavily conditional. That is: provided with innumerable ifs and buts. It therefore does not note that such a rating would be almost useless. That it can be used for little more than comparison of very similar products. Of which the value depends on almost the same variables. It would certainly not be useful for the comparison of investing in gold vs. MBS.

The hearings of employees of rating agencies by the FCIC on 2/6/10 show that the quality of the ratings was subordinate to the preservation or growth of market share. Human resources management was aimed at eliminating assertive, quality minded employees, and keeping and attracting tractable people.

The assumption that the price developments of constituent parts of composite securities are uncorrelated or weakly correlated (independent) is an unforgivable error with very grave consequences.¹¹² If the risks were independent, then a number of inferior BBB may indeed add up to high quality AAA. But only under that condition. If there is correlation, then BBB adds up to BBB, in agreement with common sense. Even with the most elementary understanding of economics the assumption of independence cannot be understood or defended. And in any case it should have been explicitly mentioned.¹¹³

The justification of reproaches at the address of the rating agencies depends at least in part on the legal norms for the format and contents of ratings. Supposing that legal norms were given.¹¹⁴ The "AAA" etcetera is no more than a convenient summary. It is nonsense to assume that a rating will hold for all eternity, and that AAA guarantees 100% safety. The commissions nevertheless seem to assume or require this. Perhaps this lack of understanding explains why they paid no attention to the way in which the risks of securities are actually described by the rating agencies, and to the way they should be described ideally. This may explain why they judge so easily.

But however described, risks remain risks. It is generally accepted that in a casino one should not wager more than one can pay. Institutions in the financial system may risk more than 10 times what they can pay. Nothing like this is noted by the commissions.

In connection with the evaluation of competencies the following is remarkable. In session 3 of the hearings of 2/6/10 "expert" Witt of Moody's is hardly or not able to explain how AAA can be made on the basis of BBB.¹¹⁵ He makes much more ado than necessary. And the FCIC clearly needs more than half a word.

Like everyone else, the rating agencies could have known that the financial economic system is unstable. Since this is very important for risk management, they should have noted this systematically in the elucidation (and/or appendices) of their ratings. The instability does not affect all securities equally, and is therefore even important for relative ratings.

The rating agencies play no role in Basel I. They do in Basel II. The text of Basel II mentions "internationally recognized rating agencies". About the definition of "rating" Balthazar remarks:

«Rating systems must have two dimensions: one for estimating the PDs [= probability of default] of counterparties (we treat this in this chapter) and one to estimate the LGD [= loss given default]

¹¹² If the witnesses don't lie, this error also demonstrates insufficient quality of education. The error is unforgivable anyway, because the condition of independence is part of the same elementary probability theory used to show that the combination of risks yields a lower total risk. This theory is taught in the first year of university physics and mathematics.

¹¹³ It may have been, but the author doesn't know: nobody in the dossier has said anything about this. It is a great pity that FCIC or CDW have not described ratings, or the rating of one specific product, in some detail.

¹¹⁴ If not, the question arises as to the legal basis for, and the meaning of, the reproaches. And the legal norms should be complemented with a system for sanctioning non compliance.

¹¹⁵ See the file with the transcript of this session in the directory FCIC/Hearings. The explanation is elementary probability theory.

related to specific transactions.»¹¹⁶

It is not clear how systemic risk is to be dealt with. Nothing is said about norms for rating agencies or rating methods, or a system of independent periodic evaluation of ratings. In point 15 on p. 4/12 the revised version of Basel III mentions a IOSCO *Code of conduct fundamentals for credit rating agencies.*¹¹⁷ Point 120 on p. 52/60 and following discuss the integration of the code in the Basel agreement.

8. Another example of dangerous lack of understanding: of “mathematical models”.

Summary and conclusions.

1. Its discussion of quants and models shows that the FCIC doesn't know what mathematics is.
2. As a consequence, it misrepresents the cause of some errors of financial institutions. Not mathematics and computers caused problems, but quants who built incorrect models on the basis of incorrect assumptions.
3. As another consequence, the problems of models in organizations, and the inability of management to evaluate supposed experts, remain unmentioned.

■ That the understanding of the FCIC of even slightly mathematical aspects leaves much to be desired can also be seen in the discussion of the role of “quants”: quantitative analysts. The FCIC seems to think that these people can do what they are supposed to do, and that it is clear how that is to be done.¹¹⁸ And that this is mathematics.

«As early as the 1970s, Wall Street executives had hired quants- analysts adept in advanced mathematical theory and computers- to develop models to predict how markets or securities might change. Securitization increased the importance of this expertise. Scott Patterson, author of *The Quants*, told the FCIC that using models dramatically changed finance. “Wall Street is essentially floating on a sea of mathematics and computer power,” Patterson said.

The increasing dependence on mathematics let the quants create more complex products and let their managers say, and maybe even believe, that they could better manage those products' risk. JP Morgan developed the first “Value at Risk” model (VaR), and the industry soon adopted different versions. These models purported to predict with at least 95% certainty how much a firm could lose if market prices changed.»¹¹⁹

The ideas and assumptions of the FCIC (and Patterson) are without foundation, and incorrect. It is nonsense that “Wall Street is essentially floating on a sea of mathematics and computer power”. Wall Street was not dependent or floating on a sea of mathematics, but on debatable and incorrect assumptions. Not computers and mathematics were the problem, but quasi scientific assumptions. If they only depended on mathematics there would not have been a crisis.

The models referred to in the quote were no more than hypothetical and esoteric theories, which were unambiguously falsified by the crisis. The quants couldn't what they pretended, or what their superiors thought or said they did.

In general the use of models by organizations is a great risk:

- Their inscrutability is no measure for quality;
- They are understood by very few people at most;
- Those who work with them often cannot describe and communicate about them understandably;
- They are not discussed freely, openly and critically.

¹¹⁶ Balthazar, *From Basel I to Basel 3*, p. 115. In the dossier.

¹¹⁷ IOSCO= International Organization of Securities Commissions. The first version of Basel III, of September 2010, says nothing about this. The revised version is of June 2011. Both versions can be found in the dossier. They have dates 20101216 and 20110601 respectively.

¹¹⁸ Probably like their managers.

¹¹⁹ FCIC report p. 44/72.

As a rule, quants cannot be evaluated by their superiors. They may be believed on the basis of past results, but as experience- including the subprime crisis- shows, these are no guarantee for the future. So they must have been believed blindly, and against reason. With respect to the quants and models, managements demonstrate irresponsible wishful thinking. It doesn't seem far-fetched to assume that the simplistic and incorrect notions of the FCIC about mathematics and models are representative of those of managements in general.

9. More explanations of failing risk management and reckless behavior.

Summary and conclusions.

The following are some of the explanations of failing risk management and reckless behavior:

1. Especially in management, daring to take risks for many years was considered positive if not necessary. Fearless with respect to risks was seen as the character trait distinguishing the entrepreneur or manager from the common people.
2. A general failure to understand that self regulation is a contradiction in terms, and that adequate supervision and regulation are beneficial for the sector as a whole. This failure can be explained by the appointment of dishonorable, incompetent persons by similar persons, and by defective education.
3. The fiction that (strict) liability can be safely replaced by capital requirements of less than 100%, as in the Basel accords.
4. There were good reasons for taking risks, and no compelling reasons for being careful about risks, least of all about risks for outsiders.
5. Unprofessional and irresponsible affordable housing policy by successive US governments and presidents.
6. Pressure from the US government on supervisors and financial institutions to support its affordable housing policy by tolerating greater risks.
7. Deregulation policy by many governments: itself reckless, and facilitating recklessness.
8. Failing supervision, including that by parliaments.
9. Failure especially by those responsible to understand or openly discuss “risk” and “risk management”.

■

How could so many people take (much) more risk than they could bear?

In the case of mortgage buyers it can be explained by wishful thinking and badly founded optimism about the development of their income and home prices. In general it can be partially explained by lack of understanding of the concept of risk, inability to estimate (total) risks, and the absence of authoritative norms for (un)acceptable risks. All this in a situation of competing institutions, and an enterprise and executive culture which highly values “the courage to take risks”, and looks down on risk avoidance. An executive culture in which risk avoidance is equated with failure to use opportunities. And indeed, there is indeed a risk that the competition uses opportunities better than you do, and will marginalize your organization by success. As long as things go well, one seems to be able to continue taking (more) risks.

The inquiry commissions did not explain that, and why, a group of competitors endeavoring to increase market shares at each other's expense needs effective supervision. They did not explain why in such a situation self regulation is nonsense and a contradiction in terms, and why effective supervision isn't harmful but beneficial, at least for the group. They did not point out that this is a general phenomenon. That it is not only relevant for financial institutions in the narrow sense, but also for the rating agencies.¹²⁰ In their hearings and reports nothing contradicts the hypothesis that the commissions and other principal persons did not or not sufficiently understand this. Nothing contradicts the hypothesis that they terribly underestimated the importance of insufficient supervision in allowing developments which would sooner or later inevitably precipitate a crisis. The lack of

¹²⁰ For the last see the FCIC hearings of 2/6/10, in the directory FCIC/Hearings.

understanding can next be explained by the appointment of dishonorable, incompetent persons by similar persons, and by failings in education.¹²¹ Although failings in education are not an excuse: somebody with the necessary talents can correct them rather easily. And anyway: somebody accepting a responsible job should have the know how necessary for that job. Neither doing one's best, nor being just as good or even better than similarly dishonorable, incompetent persons, is enough.

There are no (binding) norms for risks. Instead, there are capital requirements. Capital requirements are relatively easy to understand and verify. In the hearings of the inquiry commissions lots of principal persons have declared that they have always tried to increase the capital requirements, that their efforts met with strong resistance, that they nevertheless made important progress, that things can always be improved, etcetera. As if capital requirements ensure safety, and make risks bearable. They don't. More capital may reduce risk and harmful consequences. But it is unclear under what conditions they will be sufficient. Capital requirements, as they are understood up to now, may be useful. But they are certainly not sufficient for adequate risk management. Compliance with capital requirements guarantees nothing. Basel I didn't, and Basel II, III and IV don't or won't either. The percentages of the required capital, and the definition of "capital", are a political compromise, not based on any reliable argument or theory. They are not calculated to reduce the remaining risk to less than a certain, generally accepted, maximum. The facts prove that the requirements valid at the time were very insufficient, even though each agreement had been presented with just as much fanfare as the former. But the most important fact is that capital requirements do not offer any guarantee for safeguarding outsiders.¹²²

All this could and should have been known by those concerned. In the first place by the supervisors. They should have analyzed the situation and its implications at least in their annual reports.

The idea of replacing liability and punishability by capital requirements is incompatible with the equal rights principle. A citizen buying a mortgage has to satisfy much stronger requirements. And the crisis (and for example *Inside Job*) shows that there is every reason to distrust financial institutions and their supervisors and regulators.

As noted earlier, in spite of Basel it is entirely unclear how financial institutions can or must deal with risks. Basel sets no limits to risk taking. Notwithstanding Basel, employees will profit from upside chances, while having little or nothing to fear from (more distant) downside risks. Capital requirements do not change the situation in decision making. Or maybe they do, but in a far too obscure, indirect, complicated, and variable¹²³- that is: meaningless- way. The essence is that benefits and costs (including those for outsiders) need not be taken into account as being equally important.

The many and excessive payouts to CEO's, CFOs etcetera as soon as financial institutions began to turn in losses in the beginning of the crisis are just as many examples of this systematic bias. The compensation systems of the US and the Netherlands differ quite a lot. But the extremely high salaries of Balkenende, Bos, Kok, Ruding and Zalm show that in the Netherlands too politicians have nothing to fear from responsibility for deficient laws, failing supervision and high government debt.¹²⁴ The preventive effect of existing law is clearly non existent. The crises, and the reactions to the crises, show that the principal persons had no reason to do their job properly.

Please don't forget that in many other fields of human activity liability and criminal law are used to influence and/or punish behavior, and to recover damage. In other words: the law (politicians) is inconsequential: there are fundamentally different rules for similar (mis)behavior.¹²⁵ As a consequence it is possible to "privatize profits and socialize losses".¹²⁶ In this sense there is no equality before the law.

¹²¹ And more, to be discussed in more detail later.

¹²² And indeed, nobody asserts as much...

¹²³ Because the capital requirements change with the value of the (leveraged) "products", such as loans or (other) securities.

¹²⁴ This refers to their jobs and salaries after they left politics.

¹²⁵ In this study, "inconsequential" is supposed to mean: differently in similar cases.

¹²⁶ As noted before, the summary "privatizing profit and socializing losses" can be found for example in the transcript of the hearing of Greenspan by the FCIC on 7/4/10.

For example the annual reports of the GSEs show that institutions were well aware of the affordable housing policy of the federal government, and actively contributed to its implementation. The FCIC minority report of Wallison shows that the government, especially HUD, exerted pressure on mortgage sellers to ease mortgage requirements.¹²⁷ Modern governments are all-powerful. Institutions meet governments in 1001 ways, and have a great interest in being seen as cooperative by governments (and politicians). By refusing to actively support government policy, institutions not only forgo great potential profits, but are sure to meet problems in other areas. Of course the easing of mortgage requirements increases the risks. But who can ignore the President of the USA?

The inquiry commissions did not or hardly look into the communication between governments and supervisors. Nothing shows that they studied the minutes of their meetings. But even if supervisors are not expressly required (by law, as the Fed) to actively support government policies, it is no more than plausible that they tried to cooperate as well as possible. (Their heads were appointed without exception by governments). Not only with housing policy but also with deregulation. Although this is not sufficient to explain the bragging in the annual reports, and the misleading reassuring picture painted of their part of the financial system. These can only be explained by a combination of incompetence and lack of integrity.

Remains the explanation of the affordable housing policy of the federal government. Or rather: the irresponsible implementation of that policy. For of course, affordable housing is a very nice goal. Nothing wrong with that. What was very wrong was the dogmatic interpretation of the given situation, and the authoritarian way in which the government wanted to change it, without due care, without thinking about the consequences, and without periodic critical evaluations. No risk analysis, no risk management. No due regard for warnings, such as by OFHEO. Nothing had been learned from the soviet experience with five-year plans. Housing was to be affordable, and the quantitative goals had to be realized. The (hypothetical!) control of government by parliament didn't work at all. The representatives of the people supported their irresponsible leaders, and showed no fear for people's control by non-re-election.¹²⁸ Here too we see a combination of incompetence and lack of integrity. All vital positions are occupied by unsuitable persons.

Both the actual risk management and various remarks of the FCIC seem to reflect deficient understanding of risk management, and absence of awareness of this deficiency. The problem is wider however. As shown by the Wikipedia page "risk management":

«Risk management is the identification, assessment, and prioritization of risks (defined in ISO 31000 as the effect of uncertainty on objectives, whether positive or negative) followed by coordinated and economical application of resources to minimize, monitor, and control the probability and/or impact of unfortunate events or to maximize the realization of opportunities. Risks can come from uncertainty in financial markets, project failures (at any phase in design, development, production, or sustainment life-cycles), legal liabilities, credit risk, accidents, natural causes and disasters as well as deliberate attack from an adversary, or events of uncertain or unpredictable root-cause. Several risk management standards have been developed including the Project Management Institute, the National Institute of Science and Technology, actuarial societies, and ISO standards. Methods, definitions and goals vary widely according to whether the risk management method is in the context of project management, security, engineering, industrial processes, financial portfolios, actuarial assessments, or public health and safety.

The strategies to manage risk typically include transferring the risk to another party, avoiding the risk, reducing the negative effect or probability of the risk, or even accepting some or all of the potential or actual consequences of a particular risk.

¹²⁷ The Chronicle shows that in the period considered, the mortgage requirements were gradually weakened.

¹²⁸ Which can be explained by the unlimited possibilities of (concerted) manipulation by politicians, also of the "free" but dependent press.

Certain aspects of many of the risk management standards have come under criticism for having no measurable improvement on risk, whether the confidence in estimates and decisions seem to increase.»¹²⁹

The first sentence looks like a definition of the concept “risk management”. It is multivalent, and therefore inadequate. In addition it makes risk management dependent on subjective valuations. The “or to maximize the realization of opportunities” not only creates ambiguity, but possibly even a contradiction.¹³⁰ For as explained earlier, the alternative with the largest expected yield (for a given institution) may be attended by the largest risk. In general, the alternative with the smallest risks is not the alternative with the largest expected yield.

The second paragraph only concerns risk in the sense of possibilities for events with negative consequences, not about opportunities for profit. The text does not address the potential conflict between the “positive or negative” in the definition.

For outsiders risk management in the Wiki sense is useless. Due to the ambiguities created by “economic” and “or to maximize”, risk management in the Wiki sense ensures neither reduction of harmful consequences nor avoidance of unbearable costs. It offers no guarantee at all.

The ambiguities of the Wiki page relativize the critical attitude of the inquiry commissions. The Wiki page shows that their critical attitude is incompatible with mainstream thinking about risk management, and needs much more explanation. The commissions should have told what they mean by (good) risk management, and why. They should have shown under what (legal) conditions good risk management is to be expected, and why.

10. To conclude and to be kept in mind: the wider implications of the observed phenomena.

When trying to learn lessons from the crises it is very important to realize that there were and are not only risks of a financial or economic nature, but that there are probably much larger risks in areas such as armaments, conflicts within and between states, the environment, and nano and genetic engineering. In these areas too:

1. There are well founded doubts and questions about safety;
2. There is reason to assume that the probability of personal profit of decision makers is given a much higher priority than the risks for outsiders;
3. There are empirical and theoretical reasons to assume that supervision does not do what it has to;
4. It is assumed that sufficiently small risks will not be realized, or have no consequences;
5. People behave as if non realization of a risk means that it does not exist.

7B.4. Failures of governments and parliaments.

Table of contents of this section.

1. Summary and conclusions.
2. Introduction and overview.
3. Insufficient liability as a cause of reckless risk taking and the transfer of consequences of risk realization to innocent outsiders.
4. Hierarchical organization.
5. No supervision of supervision. Supervision and government policy: a risky combination.

¹²⁹ Wikipedia “Risk management” 16/2/12. The text was reformatted by the present author. For sources see the Wiki-page. Some sources can be consulted only at cost. This applies for example to the ISO-documents. If the Wiki-page gives a reliable picture of the ISO-directive, then the directive has important deficiencies. It would seem that compliance with the directive offers little more than a semblance of safety. Not all deficiencies have been noted here. To avoid misunderstanding: according to the present author the text is useless due to essential lack of clarity and other deficiencies.

¹³⁰ Note that the text has “opportunities”, not “expected results”.

6. Inadequate appointments.
7. Deregulation.
8. Housing policy: affordable housing, community reinvestment act, and tax relief.
9. Moral obligations.
10. Government and supervision were unprepared for a crisis. Practical circumstances as explanation of inconsequent and arbitrary conduct.
11. Lobbying.

1. Summary and conclusions.

1. At least in the following areas governments and parliaments have failed to do what legitimate governments and parliaments are required to do, and to such an extent that they can be considered as the principal cause of the subprime crisis:
 - Regulation (including the law);
 - Supervision of supervisors;
 - Hierarchical organization;
 - Appointments;
 - Deregulation;
 - Housing/mortgage policy;
 - Permitting lobbying.
- It is plausible that appropriate action in any single one of these areas would have prevented the crisis.
2. Liability and criminal law are hardly or not relevant for, or administered to, employees of organizations and political functionaries. The law is inconsequent, and there is no equality of adjudication. The law is incompatible with respect for (other) people.¹³¹ As a consequence the persons indicated have insufficient reasons to think before they act (or decide to do nothing). The law admits of recklessness towards outsiders, and maintains dishonorable and incompetent functionaries. Harmful consequences of their activities and omissions can be transferred to outsiders with impunity and without costs.
3. The law is incompatible with the traditional right to be safeguarded. The breakdown of this traditional right dates from the 19th century. It was said to promote the general welfare. This was never proven. No effort at evaluation has ever been made. In the light of the crises (and other phenomena) the assertion cannot be maintained.
4. To a certain extent, reduction of incentives for proper conduct can be compensated by other rules and supervision. There is however no safety net if the rules and/or supervision are ineffective. In the decades before the crises, both rules and supervision failed.
5. The supervision of supervisors by governments and/or parliaments was insufficient. Governments and/or parliaments adjusted law and/or regulation insufficiently to developments in the financial services sector, or made the discrepancy and risks even worse.
6. In the decades before the crises governments and/or parliaments acted (and failed to act) as if risks don't exist, or can be taken with impunity.
7. No member of government or parliament has shown any understanding of the operation of the financial system as a whole, of the processes, of vital parts, and the conditions for safe and adequate operation.
8. Nothing shows awareness of the instability of the financial system.
9. The regulation of hierarchical organizations facilitates their degeneration into dictatorship. The operation of all organizations in the financial system, and all organizations responsible for its proper operation, show that integrity, corporate and other codes, and whistleblower regulations, are inadequate. Self correction of these organizations is almost impossible and has not taken place.¹³²

¹³¹ In the strict sense: respect is violable. In general with impunity, and without obligation to repair damage caused.

¹³² This is most easily and clearly seen by comparing annual reports of supervisors of a series of years around the crisis, say 2006-2010.

10. That all¹³³ principal persons have failed can be explained as follows. The combination of present-day election systems and the absence of liability and punishability causes dishonorable and incompetent governments and parliaments. Honorable people without false pretensions don't stand a chance. Governments and parliaments appoint all heads of all essential (semi) public organizations. Such as supervisors.
11. The combination of present-day election systems and the absence of liability and punishability for principal persons and organizations is the Achilles' heel of the democratic constitutional state. The system does not imply a need for integrity or competence.
12. The illusion that deregulation, more freedom without liability and punishability, promotes the general welfare is incompatible with common sense, experience, and the theory of the PD game. The PD game shows that regulation (limitation of freedom) and supervision can be in the best interest of an industrial sector such as the financial system.
13. The ministry of HUD of the US dictated the GSEs 4-year plans for affordable housing goals,¹³⁴ and exerted pressure on mortgage sellers to cooperate. The goals were systematically increased. As a consequence, mortgage requirements were reduced and risks increased. The HUD policy was purely dogmatic. Professional know how about policy making was systematically ignored.
14. Many people blame banks for immoral behavior. But if moral behavior is important, why doesn't the law require (specified) moral behavior?¹³⁵ The more so since it is generally acknowledged that one is free within the bounds of the law. If there are competitors, it is obvious that competitors will use their freedom to the limit.
15. Blaming governments and supervision for unethical behavior is well founded. But their behavior is not only unethical: they simply didn't do their legal duties.
16. Supervisors and governments had no policy or plans for eventualities. The absence of preparation, the speed of the developments, the pressure of the circumstances, the incompetence of the principal persons,¹³⁶ and the fact that their organizations were adapted to the normal situation- not to a crisis- can explain that during the crisis relatively many errors were made. The bankruptcy of Lehman may be one of them.
17. The fact that the supervisory system was not adjusted to changes in the financial system, or worse, that supervision was weakened when safety required strengthening, can be partially explained by the influence of the banking lobby. Assertions claiming that lobbies have a positive influence by providing information and expertise, and that politicians know how to handle lobbies, have been convincingly falsified by the subprime crisis. For the purpose of information the world wide web offers a transparent alternative. Lobbying in its present forms, and cooperation with lobbying, should be prohibited and criminalized. Apart from this, lobbyists, just like everybody else, should be liable and punishable for the consequences of their activities.
18. Less money and less people for supervision (for example due to budget cuts) normally reduces the chance of finding infringements of applicable norms. If that should not result in an increase of misconduct, then the product of the amount of the fine and the chance of getting caught should remain the same. In other words: reduction of the chance of getting caught should always be accompanied by a proportional increase in fines. Experience shows that governments and parliaments don't do this. They don't seem to understand, or there is malicious intent. So once more: lack of integrity or competence, or both.

2. Introduction and overview.

Governments and parliaments, and only they, determine the framework in which persons and corporations in a given country live and work. In so far as the operation of a financial economic system can be influenced by laws and regulation, governments and parliaments are responsible in the

¹³³ With the partial exception of Born of the CFTC. Partial because she gave up. See the Chronicle, under 1998 and 1999. She let herself be eliminated. She furthermore participated in the FCIC. And did not dissent.

¹³⁴ See for example Pinto, *Government housing policies etcetera*, p. 149, paragraph c.

¹³⁵ The first norm of moral behavior seems to be: do not harm another. But who proposed to introduce strict liability, or to extend existing liability?

¹³⁶ Both as regards management and the operation of the system and the economy.

last resort for what happens in that system. They determine the boundary conditions. Where “boundary conditions” are to be understood in a wide sense. Laws determine what is permitted and forbidden, and the obligations of people and corporations. They determine the kinds and amounts of taxes, and the redistribution of the taxes paid. Laws establish innumerable organizations, give them tasks, powers and budgets. Last but not least they prescribe the appointment procedure for the heads of these organizations. Both the regulatory and financial possibilities of modern governments and parliaments to exert influence are unimaginable. It may be true that they cannot do everything they want, even supposing they know what they want, and don't want things which cancel each other out. They cannot prevent people from ignoring red traffic lights. But they could have prevented the crises of 2007-2013 with the powers, instruments and information they had at the time. Neither quantitative nor qualitative changes were necessary.

At least in the following areas governments and parliaments have failed to act properly, and to such an extent that they can be considered as the principal cause of the subprime crisis:

- Liability and criminal law.¹³⁷ Deficiencies in these laws effectively promote risk taking. They safeguard persons behaving irresponsibly, and force innocent outsiders to pay the price of the misconduct of such persons;
- The supervision of supervisors;
- The regulation of the hierarchical organization;
- Appointments;
- Deregulation;
- Housing/mortgage policy (CRA and AH);
- Lobbying.

The failures in these areas will be described below. If governments and parliaments had done what they could and should have done,¹³⁸ then there would not have been a crisis. But they are not only responsible because they failed to do what they should have done. They are also responsible for the appointment of insufficiently honorable and competent people in all key positions. Many governments and parliaments moreover are responsible for thoughtless deregulation policy, and the corresponding weakening of supervision.

The US government, including Congress, was furthermore responsible for the subprime crisis because of its affordable housing policy.

The second crisis, the debt crisis, was caused by government debts which seemed to become irredeemable, and by inadequate international (EU) regulation. All western governments and parliaments are responsible for this situation. In this field too they took unbearable risks.

Methodological remark.

Because governments and parliaments, and only they, are responsible for the law and its enforcement, in an evaluation like the present one, an assertion about a person or corporation having failed should always be accompanied by the question whether or not his/its actions or omissions were in accordance with the existing legal framework. If not, the follow up question is what possibilities the law offers for obtaining redress and for sanctioning the transgressor. Possibilities both in a formal and practical sense. A formal possibility may be practically useless for example by impossible requirements regarding proof. If possibilities do not (practically) exist, the law may be ignored at no cost and with impunity. (Probably at the cost of other people). In such a case there is no reason to expect that people and corporations comply with the law. Can such a law be called adequate? If not, governments and parliaments failed in their duty as lawgivers.

A politician cannot call a norm or value important if he does not try to get it translated into regulation. If he does not try, he shows that his words are empty window dressing, and that he is unreliable.

¹³⁷ And the corresponding procedural laws, for example where they require proof of risk of causation of harm instead of proof of safety. This principle is a risk in itself.

¹³⁸ Should have done: if only because of the constitution, which they swore to abide by.

3. Insufficient liability as a cause of reckless risk taking and of the transfer of consequences of risk to innocent outsiders.

In the present report liability always refers to:

- Harm caused by avoidable behavior of people. Harm could have been avoided if these people had made another choice. The “avoidable behavior” may be activities or omissions. The latter when there is a duty to act;
- Respect for, and safeguarding, people who did not approve of the harm causing activities or omissions.

Liability means that harm has to be repaired or compensated. Avoidably causing harm obviously violates the respect principle. Avoidably causing irreparable harm is the worst one can do. It should be discouraged as much as possible. When people cannot repair or compensate the harm they caused, adequate punishment may ensure the best possible preventive effect. In other words: punishment can serve as a complement to liability.

This section discusses those aspects of liability and punishability which are more or less directly relevant for the behavior of the principal persons and organization in connection with the financial crises. More fundamental and general aspects will be treated in section 13 of chapter 9. Of course, the boundary is not sharp, and all aspects could have been integrated in a single chapter. The problem is that liability and punishability are relevant for all cases studied, and cannot be missed in an analysis of the financial crisis. The author kindly asks the readers’ understanding for the choice made.

Summary and conclusions.

1. According to traditional law everybody is personally liable for the consequences of his doings (and omissions), and punishable if he cannot repair or compensate the damage he caused. There are logical and practical reasons for this rule.
2. Governments, parliaments, and corporations and their employees have limited liability. They asserted and assert that on balance this is beneficial for society. This is no more than a hypothesis. Theoretically (logically) it is clear that repairable damage can be compensated if the sum of benefits and costs is positive. However, in many historical cases one can only get a positive sum if human rights and irreparable damage to people’s lives are counted for nothing.
3. To a certain extent a limitation of liability can be compensated by the combination of suitable norms and supervision. But only if the supervisor of the supervisor is strictly liable. If the ultimate supervisor can dysfunction with impunity, disaster is only a matter of time. Because of incomplete knowledge and understanding, norms and supervision may not prevent damage. They don’t provide compensation. By replacing traditional liability with norms and supervision governments and parliaments bound themselves to ensure effective supervision. With respect to the financial supervisors, all western governments fatally neglected this duty.¹³⁹
4. The ultimate problem is the lack of effective corrective sanctions for the dysfunctioning of members of parliaments.¹⁴⁰ The “representatives” don’t defend the interests of the people, and do not work honorably and competently.
5. There is a close relationship between liability and criminal law on the one hand, and risk management on the other. Nearly all forms of dysfunctioning shown in the Chronicle of the subprime crisis can be attributed to insensitivity for the consequences of one’s actions and omissions. The insensitivity can be explained by the (effective) limitation or absence of liability and punishability. Everyone in responsible positions could afford to take risks which cannot be

¹³⁹ The “all Western governments” can be concluded from the IMF and BIS reports. The statement does not mean that other governments are better, only that other governments may not have been involved, or that the available information does not allow reliable evaluation.

¹⁴⁰ Note the amazing fact, that there are no noticeable exceptions. Nobody admits that in the period 1994-2006 they should have been much more critical of deregulation in the financial system, the financial supervisors and AH policy (with arguments such as presented on this report). To mention just three simple examples.

afforded under traditional law. Almost all negative consequences had to be borne by innocent outsiders. Those who caused the crisis by dysfunctioning have hardly suffered at all. Many of them continued their career as if nothing had happened. Sometimes with a salary which is a multiple of their former salary.¹⁴¹

6. A long time ago, limitation of liability could in theory be motivated by the hypothesis that it serves the general welfare, that its net effects are positive. In the light of the crises the hypothesis should either be abandoned or evaluated.¹⁴² It should be abandoned if violation of human rights and causation of avoidable irreparable damage are strictly forbidden.¹⁴³ But nobody mentions evaluation or abandonment. Including the inquiry commissions. Which suggests a general lack of analytical abilities, and/or awareness of the incorrectness of the hypothesis, in combination with the idea that raising doubts may harm one's personal interests.
7. In the 19th century, supposedly on the basis of the hypothesis that it serves the general welfare, governments and parliaments departed from traditional law, and abolished the general (strict) obligation to repair or compensate damage caused by avoidable activities. This makes governments and parliaments much more responsible for the consequences of the crises than they would have been if they had left traditional law intact.¹⁴⁴
8. Without liability people have no compelling reason to take account of costs for outsiders. Therefore liability law can best be defined in such a way that actors are forced to consider all costs, and treat all costs equally. Punishment replaces the part of the externally caused costs which actors cannot pay.
9. One should become liable upon voluntarily assuming a job or embarking upon an activity.
10. Liability and the complementary punishability are logically necessary, and improve decision making and reparation of damage caused. Reduction of bonuses has no similar effect. In other words: making liability and punishability more consequent is an effective measure, restriction of bonuses is useless.
11. Members of governments and parliaments have effectively placed themselves and the organizations which they finance with tax receipts above the (normal) law.
12. Restoration of strict liability, supplemented by punishability where needed, solves several connected problems:
 - It necessitates taking account of all costs and benefits, opportunities and risks;
 - It greatly reduces the dependency on supervision and supervision of supervision;
 - It makes the law more just and consequent;
 - It makes liability law compatible with respect for people (present limited liability is not).

Introduction. Logical principles of law, and reactions to infringements of these principles.

From the definitions of subjective and objective it follows that norms and values are subjective.¹⁴⁵ But if people want to communicate meaningfully with one another on a voluntary basis, then they must accept the following rules:

1. It is not permitted to harm another person, "harm" being defined by the other person. As a consequence, activities causing risks need prior permission of everyone running a risk;
2. Avoidable harm is repaired as well as possible by the actor, and if reparation is not

¹⁴¹ This applies for example to Dutch former ministers Balkenende, Bos and Zalm.

¹⁴² Or rather: In the light of the crisis and other disasters. For it is not difficult to argue that both world wars of the 20th century could and should have been prevented by France, the UK, the USA and many smaller countries, even independently or in small combinations. See for example W. Shirer, *The Collapse of the Third Republic*.

¹⁴³ The "strictly" meaning: not allowed at all. In other words: it is not permitted to harm a single person even if it would benefit 1000 other people. At least without prior permission (after full and correct information).

¹⁴⁴ Supposing the last two crisis to have happened under traditional law, which seems improbable. Even though crises may be possible under full liability and even harsh criminal law. Such laws do not eliminate the fundamental instabilities indicated early in this analysis. But they do make people think- twice- about the consequences for others.

¹⁴⁵ See the paper *Communications and norms* by J.F.C. van Velsen, as pdf-file on the internet, www.lawoflogic.net.

- possible, compensated;¹⁴⁶
3. If avoidable harm or hinder was and/or is caused, and the actor is unwilling and/or unable to pay compensation or reparation, then the victim can appeal to an independent judge;
 4. Who is to decide about subjective aspects;
 5. If full reparation or compensation is impossible, the actor is punished in a way that is proportional and discourages actors from repeating the behavior that caused the harm.¹⁴⁷

The five fundamental norms are logical and objective in this sense, that they are premised by, or follow from, the agreement which must (implicitly) be made in order to be able to communicate. For further substantiation the reader is referred to the literature.¹⁴⁸

Without agreement about these rules there can be no communication deserving to be called communication.¹⁴⁹ Nobody can be assumed to communicate voluntarily if these rules are not accepted. They can therefore be considered as the most fundamental principles of law.

Taken together the norms constitute a basic law. As far as known, this basic law has been accepted as law by all nations of all times, even though systematically violated by governments. Everyone considered it reasonable or natural, even if unaware of the reason.

Liability versus norms+supervision.

Modern law is not self-evident.¹⁵⁰ Only a small part of the law is logical, and the logical part only concerns what can be called traditional activities. Such as concluding contracts, buying and selling, and theft by natural persons. This part of the law was developed from what Roman lawyers called the law of the nations, and from the common law. The differences are relatively small. However, as from the 19th century, governments have modified parts of the law in a fundamental way. The changes mean a break with traditional principles of law. They concern especially the law regarding public and private organizations, and their employees. The changes facilitate risk taking. Organizations need no longer fully compensate damage caused: their liability is limited. In important cases liability is replaced by norms. As long as regulatory norms are complied with, there is no liability. Often the norms are debatable however. They may reduce damage or risks, but need not eliminate them. It may be too easy to claim compliance. Failure to comply may be hard to prove. In any case the costs of damage due to activities within the framework of the norms are shifted to outsiders.¹⁵¹ Norms moreover don't cover all the risks. Working with norms assumes that the norm-setter has complete knowledge and understanding. This assumption is almost never correct. Even serious damage cannot be ruled out. An important example is the bankruptcy law. This is the pre-eminent example of shifting costs of failure to the rest of society.

Important are furthermore the procedural aspects of the law. Here not the safeguarding of obviously innocent outsiders has priority, but all kinds of questionable procedural requirements.^{152, 153}

¹⁴⁶ Avoidable harm, not (only) intentional harm. "Accidental" harm is not excluded either.

¹⁴⁷ Discouragement/ preventive influence is necessary because of the irreparable (irreversible) nature of the damage caused.

¹⁴⁸ For example *Het recht van de logica* (Eburon, Delft, 2003, in Dutch) or *Communication and norms*.

¹⁴⁹ In the terminology of John Locke: then only meaningless sounds or scrawls are made.

¹⁵⁰ Nor consistent. At least if rules of law are called inconsistent if they assume inconsistent premises. For example for liability and punishability.

¹⁵¹ "Damage" is and should always be assumed to include risks, since in general and in the long run risks always mean damage.

¹⁵² Limitation of liability and punishability for organizations is not so conspicuous because organizations are not people. One therefore expects differences. It seems logical that the law for organizations differs from the law for natural persons. Specific corporate law seems necessary. And once differences are accepted, one will more easily accept differences where equality would have been possible and even logical. Once differences are accepted, one will not so easily notice that corporate law favors corporations as compared to the corresponding law for natural persons. And of course the interested people will do nothing to undeceive you.

Below some examples of differences will be given. For another and more comprehensive discussion see chapter 9 of *The law of logic*.

As regards his work, an employee is in general considered as a representative of his or her organization. Formally he or she acts in the name of the organization. Concerning the actions and omissions of the employee

As a rule compliance with norms is supervised by organizations set up for that purpose. The system works if these organizations do what they have to do, and if the fines¹⁵⁴ for infringement of the norms are sufficiently large to make compliance cost effective. The history of the financial system and many other cases show that neither is the case: supervisors often do not do their duty, and the fines are far too small.¹⁵⁵

From the above it can be concluded that modern law encourages risky and reckless behavior of corporations and their bosses, and that in a sense this is intentional.¹⁵⁶ It is correct to speak of encouragement because limitation of liability means that corporations have no financial reason to take all costs into account. What is profitable for a corporation may be harmful for society (including the corporation). Modern law implicitly allows transfer of costs of harmful consequences of activities and omissions of corporations to people who have nothing to do with these activities or the decision making about them. It allows responsible bosses to hide behind their corporations. In general, actors need not pay damages in full, and are not punished proportionally. Because of the technological possibilities and the scale of many activities in the modern world this is asking for disasters. And they came.

Liability and optimization of behavior.

Strict liability is necessary to optimize behavior from the point of view of society as a whole.¹⁵⁷ If one wants people to act in such a way as to realize the greatest progress or improvement for society as a whole, then one should oblige them to take all costs and benefits of intended actions into account. Not only costs for themselves. Without strict liability people have no compelling reason to take account of costs for others. Therefore liability law can best be defined in such a way that people are forced to consider all costs, and treat all costs equally. Conversely it is only too understandable that regression (including accidents and disasters) may result from excluding important categories of activities or people from liability.¹⁵⁸

Optimization of behavior in this sense also optimizes prevention. It stimulates actors to think and be more careful, and not to take unbearable risks. It requires them to ask prior permission of everyone potentially affected.¹⁵⁹

not the employee him/ herself is addressed, but the organization. Since organizations almost always have a hierarchical structure, (only) the highest boss is formally responsible. Which means that only the highest boss can speak for the organization, or somebody designated by him for that purpose.

If a corporation has caused harm, questions may arise which rarely arise if harm is caused by a natural person. For example the questions whether the harm was predictable, who were responsible formally and materially, and who knew what. In spite of the (unambiguous) hierarchical structure line managers are only rarely imprisoned because of an offence of one or more of their employees.

Politicians and jurists suggest that it is very difficult to implement the concept of punishment for corporations. Organizations are supposed to be important for employment and economic growth. (An argument that also applies to natural persons, and is only a matter of proportionality). Often corporations can hire lawyers of a much better quality than that of the judges and prosecutors. Interests and policy have priority over equal rights and adjudication.

As a consequence of these and other differences organizations almost never fully compensate damage caused.

¹⁵³ And which are rarely if ever discussed publicly. In general under the pretence of being too technical.

¹⁵⁴ As opposed to theoretical fines. What is essential are the total costs of the offender. If a judge halves a formally sufficient fine, the effect may be the same as no fine at all, because such a fine does not change the cost effectiveness of ignoring the norm in question. From what can be seen of the study of law and its textbooks, it seems probable that most jurists simply don't know and understand this.

¹⁵⁵ And adjudication and the relevant procedural law may be inadequate. This has not been studied any further for reasons of time.

¹⁵⁶ Here, "corporations" include all organizations which are not fully liable in the common sense, as an ordinary citizen.

¹⁵⁷ According to the Merriam Webster 2002: strict liability (1896)= liability imposed without regard to fault.

¹⁵⁸ As demonstrated by all the cases, including the financial crises.

¹⁵⁹ Not just a majority.

For the same reasons actors should be punished if they cannot completely repair or compensate the damage they have caused. For example when people are wounded, mutilated or killed. Punishment replaces the part of the costs that the actors cannot pay. Note that this punishment is primarily meant to ensure that people think before they act, and that they take all possible costs into account. When making a decision or choice, punishment should be seen as a risk, as a possible cost. Punishment should prevent harmful decisions.

The distribution of the relative contributions of the various participants in damage causing activities can be left to the participants themselves. If they cannot agree on the distribution, they can ask a mediator or judge to fix it, at their own cost. It may be useful to have general rules for the determination of the distribution, so that people know what to expect.

The respect principle¹⁶⁰ means that it is forbidden to transfer costs to people who did not give prior approval to the harm causing activities. Approval is only approval when given explicitly and personally.¹⁶¹ Implicit agreement inferred from an assumed agreement with the given political system is sheer fantasy and indefensible. To be defensible, approval has to be given after full, correct and understandable information. If one cannot know what one approves, approval is meaningless and invalid. Ditto when information was withheld or incorrect.

Risk management depends on boundary conditions. It is undefined, and practically impossible, as long as the boundary conditions are undefined or ambiguous. This is especially important in a competitive environment. The absence of clarity on this point is one of the reasons for the failure of the risk management of financial institutions in the run up to the subprime crisis, and up to now. Strict liability and (personal) punishability when recovery is impossible, provides the required clarity. They mean that damage must always be repaired or compensated, at ones personal risk.

Liability and punishability are much more important than bonuses. Or the reduction thereof. The purpose of liability is to compensate innocent people when other people have caused avoidable harm. Reduction of bonuses does not contribute the least to this kind of compensation. There isn't even reason to assume that it will reduce risk taking. If liability and personal punishability are accepted, there is no reason to meddle with bonuses.

Liability due to a blamable prior choice.

When considering questions of liability it may be relevant to know and understand the assumptions which are (tacitly) made about an actor, and about the conditions for liability and culpability. Suppose that an action or omission has led to harm. The action or omission may be unavoidable, or the best possible, in the given circumstances. But the circumstances may have been predictable, and the actor may have voluntarily and avoidably chosen to accept the risk created by the circumstances, or (wrongly) assumed that he or she could manage without causing harm. If it is assumed that causing harm or the risk of harm creates liability, then the last choice creates liability, even if the action or omission considered in isolation does not. This is why driving drunk may be fined, even when no accident was caused.

Another important example is the acceptance of an impossible job. The job being impossible in the sense that even doing one's utmost best is sure to be insufficient. As a rule the media and the courts ignore that members of governments and parliaments, and heads of large organizations, accept jobs, or participate in activities, which mean that they regularly take or approve decisions which they understand at most partially and cannot reverse, and of which they don't understand and can bear the risks etcetera. They ignore that acceptance of impossible jobs or circumstances is avoidable, and therefore cannot serve as an excuse. Many failures are the inevitable consequence of the indefensible acceptance of an impossible job or activity. Acceptance of an impossible top management position creates top risks. Such as the risk of having to approve decisions one understands at most by half, and

¹⁶⁰ Also called the safeguarding principle. It is the right to be safeguarded from the effects of avoidable activities of others. It can be called the respect principle because it means that an actor truly respects the opinions of the people potentially affected by his activities.

¹⁶¹ Not by a "representative".

the risks implied by the necessity to believe people one does not know and cannot reliably assess.¹⁶² Doing one's best after having made an indefensible choice, need not be sufficient to avoid disastrous errors. Timely reversal of the misstep by resignation is the only way to escape causing irreparable harm.

It is not making errors in an impossible job that is avoidable and blamable, but the acceptance of an impossible job.

Liability, risk management, and bonuses.

Risk management depends on boundary conditions, especially conditions regarding potential costs. Risk management is undefined, and practically impossible, if the boundary conditions are undefined or ambiguous. This is especially important in a competitive environment. The absence of clarity about boundary conditions is one of the reasons for the failure of the risk management of financial institutions in the run up to the subprime crisis, and up to now. Strict liability, and (personal) punishability when recovery is impossible, provides the necessary clarity. They mean that potential damage must always be repaired or compensated, at ones' personal risk.

Liability and punishability are much more important than bonuses. The purpose of liability is to compensate innocent people when other people have caused avoidable damage. Reduction of bonuses does not contribute the least to this kind of compensation. There isn't even reason to assume that it will reduce risk taking. If liability and personal punishability are accepted, there is no reason to meddle with bonuses.

Liability and criminal law as remedy against dysfunctioning supervision and politics.

Theoretically speaking the bias in decision making processes indicated in the section about risk management can be obviated by suitable regulation and supervision. Something similar applies to every system where liability is restricted to at most the damages caused by exceeding norms. Such a system only works as it is supposed to work if politics and supervision function properly. As regards the financial system they failed systematically, and during many consecutive years (from at least 1995). There was no supervision of supervision.¹⁶³ The top of the hierarchical pyramids did little more than live in style at the public expense. Politicians can only be trusted to protect themselves. As shown clearly for example in the cover up by inquiry commissions. In this respect there is no difference between political parties, or between the parties in the government, and those in opposition. All politicians neglected their duties, acted irresponsibly. None broke the veil of complacency.

Therefore the question is how to reduce the dependency from politics and supervision. The above analyses suggest: by making sure that the decision makers know that they will share in the consequences of their decisions. In a way that is proportional to the consequences for the victims. Independent of whether the decision maker is politician, entrepreneur, manager, or somebody else. In other words: by ensuring an effective coupling between consequences for the decision maker(s) and those for other people. It is unclear how this can be realized without (effective) expansion of liability and punishability. Liability and punishability should be expanded in such a way as to give decision makers and actors good reasons for safeguarding outsiders, and in such a way that damages can always be recovered from the responsible decision maker(s) and/or actor(s). Whether or not there are norms and supervision. Politicians and supervisors should not be excluded from liability and punishability.

The "effective" in "effective coupling" also refers to the procedural law.¹⁶⁴ In combination with the

¹⁶² Not to speak of the perceived requirement of always defending past decisions and activities, however indefensible and however harmful. The perception of this requirement can be seen as part of the culture of the top of both industry and politics. Of course, it violates the integrity principles of chapter 4.

¹⁶³ Not in the USA, not in the Netherlands. In this respect there is no difference between these states whatsoever.

¹⁶⁴ Procedural law regulates the administration of justice. Especially but not only the functioning of the courts. Substantive law describes all other rights, obligations, and other stipulations with the status of law. Examples of substantive law are: civil law, criminal law, budget law(s), laws instituting all kinds of agencies, the appointment of their heads, their duties, etcetera. Procedural law provides the means to enforce substantive law if and as indicated by substantive law. Without procedural law, substantive law may be misleading. With different bodies

substantive law, procedural law should be improved in such a way as to safeguard innocent outsiders as fully as possible, and make the responsible decision makers and actors repair or compensate damage caused as completely as possible, and if they can't, punish them. Procedural law should be subordinated to the safeguarding principle. Line managers for example should always share in the liability for activities or omissions of their unit.¹⁶⁵ Their share should only be reduced if they can prove for example that the damage is due to activities or omissions which are contrary to their directives, as proven by the absence of proof of their agreement¹⁶⁶ and by the other activities and omissions of their unit.

Essential aspect of the “effective” is the transfer from politics to the judge. The evidence presented in this report shows that politicians share too many interests which are contrary to the interests of the people they are supposed to represent. They cannot be trusted.

Governmental organizations are only evaluated by themselves or interested parties.

This subsection presents more supporting reasons for the measures indicated in the preceding subsection. In addition, it points out a deficiency of democratic constitutional states which affects all or almost all cases mentioned in this report.

Governmental organizations, including organizations called into being by laws, have distinctive characteristics. An essential characteristic is that their budget is provided by a ministry. Every year there are discussions between the ministry and the organization about the budget for next year. At least as regards their budget, these organizations are dependent on the ministry. They are responsible towards the ministry for the way they spend their budget. This is important because it may engender a conflict of interest between their formal duties and financial interests. Reality is that a minister or secretary wants every outsider to think that his organizations are perfect, and that he is in full control of them. For this reason these organizations in general are shielded by their ministry. At the same time a ministry should evaluate the operation of its organizations critically. It should evaluate them from a neutral, independent point of view. They never do however.¹⁶⁷ Ministries never evaluate their organizations critically, as a truly independent outsider would do. Critical evaluation creates a risk for the reputation of the minister, and for the budget of the ministry. Many of the cases studied here involve dysfunctional government organizations. None of the cases shows a critical attitude of a parent ministry. Instead, parent ministries show a shielding and defensive attitude.

As regards their work, civil servants are responsible towards their superiors. The same applies to the superiors; the highest in the hierarchy being responsible towards the minister. Who always is a politician. In the given constitutional framework, politicians are evaluated only by their peers. For a civil servant inside an organization, the law only exists in so far as his management respects it. The management knows that not all legal precepts or instructions mean what they appear to mean. They know too that many stipulations are not accompanied by rules sanctioning infringement. Which means that such stipulations can be ignored with impunity. And they are ignored in fact, even in important cases. Where “important cases” means: cases with large and extensive consequences. The rules

of substantive law may correspond different procedural laws. Such as “criminal procedure”. Not all stipulations of substantive laws are enforceable. For more information the reader may be referred to an encyclopedia or textbook on law.

¹⁶⁵ A line manager is a manager who is a constituting part of the hierarchical pyramid. An employee at the base of the pyramid is connected with the officer at the top (CEO, minister, what have you) by a series of line managers. Of different levels. A series in a ministry could be: employee, head of section, head of department, director-general, secretary-general, minister. As a general rule, formal communication, and communication about anything substantial, between any levels and between parts of the organization, is forwarded through the line managers concerned.

¹⁶⁶ For example by a signature for approval of the proposal for an action or omission.

¹⁶⁷ Outsiders might think that the positive picture is only painted for the outside world, and that behind the scenes one knows better and has a neutral and critical attitude. But 1. there is no evidence supporting this view (while there is ample evidence for the contrary view); and 2. the experience of about 25 years of the author at the ministry of education of the Netherlands is that the subsidized organizations are never seriously evaluated or criticized. Note that this is consistent with the observation of always increasing government budgets, and increasing inefficiency of services provided by government-paid organizations.

concerning integrity, duty and whistleblowing are examples. All cases show that these rules have no practical significance. Even though it is clear for example that openness of the organizations of the supervisors would almost certainly have given rise to much more and well founded discussions of the risks of the financial system. Open discussions would have made a crisis much less likely. It could easily have prevented them. Other examples are the complete neglect of the systemic risk duty by the Fed, the almost complete neglect of this duty by DNB, the absence of control of the supervisors by governments and parliaments,¹⁶⁸ and the dishonorable and unprofessional evaluations of government organizations by the Dutch General Accounting Office (DGAO).¹⁶⁹

A fundamental and important difference between politicians and government organizations on the one hand, and private citizens and organizations on the other, is that much damage due to mismanagement and misconduct of public administration is not justiciable, and that it is not judged by independent judges but by the peers of those responsible, often including those responsible themselves. The inquiry commissions are an example of this “regulation”. They fit perfectly in the system: the law is made by politicians; private citizens and organizations are judged by judges, and politicians and government organizations are judged by politicians. None of the actions or omissions of governments, parliaments and supervisors that have caused or should have prevented the crises, is justiciable.¹⁷⁰ As a consequence everyone who contributed actively to the creation and extent of the crises, or could and should have taken action to prevent them, can enjoy the fruits of his parasitism in perfect freedom. These people were and are remunerated as if they always did their job properly.

Public administrators have effectively placed themselves above the (normal) law.

4. Hierarchical organization.

How faulty regulation of hierarchical organization, dishonorable and incompetent heads, and lack of control, supported a long and undisturbed growth of the explosive power of the crisis.

Preliminary notes.

The most important elements of the empirical basis of this subsection are:

- The Chronicle of the crises;
- The annual reports of the supervisors (including BIS, IMF and OECD);
- The preceding chapters;
- The next chapter, especially the sections about whistleblower cases.

As elsewhere in this study (and reality!), omissions may be just as important evidence as actions.

The subsection may use conclusions of other (sub)sections of this Analysis, including later (sub)sections.

Summary and conclusions.

1. For all practical purposes hierarchical organizations are dictatorships. The three powers, legislative, executive, and judicial, are united, instead of separated as in society at large. Hierarchical organizations are allowed to be opaque: nobody can see and know what goes on inside, and only the head or his spokesperson is allowed to tell the rest of the world what the head wants the world to believe about the organization.

¹⁶⁸ Strictly speaking, supervision of the supervisors by governments and parliaments is not explicitly prescribed by law. However, supervision is regulated by law, the heads are appointed by the government, and at least in the Netherlands supervision is generally paid with taxes. The law also describes the purpose of the organization. Governments and parliaments receive their annual reports. At least implicitly they have to either approve the operation of the supervisors, or give their comments. Finally, it is evident that if governments and parliaments are responsible for the safe operation of something, say the financial system, they have to actively monitor this operation, and act where and when necessary. In the case of the financial system they obviously didn't.

¹⁶⁹ In Dutch: Algemene Rekenkamer. The DGAO evaluates ministries and many other government organizations. This is therefore clearly a major problem.

¹⁷⁰ Some banks and some of their employees have been brought to court. See the FCIC report, and annual reports of the SEC and possibly other supervisors for the years following the subprime crisis. Analysis and outcomes of the cases show the weakness and ineffectiveness of the law for corporations, in agreement with earlier remarks.

2. The political system appointed dishonorable and incompetent secretaries of the Treasury and heads of supervisory and other organizations. These people did not understand risks, denied and/or underestimated them, and so on. They ignored or did not understand signals from their employees. They rejected them without sound arguments, and could not or did not discuss them properly. The principal persons were not listening and tolerant, but repressive.
3. Governments and parliaments, and only they, are responsible for a regulation of hierarchical organizations that enables dishonorable and incompetent heads to remain in power notwithstanding dysfunctioning of themselves and their organization.
4. The inadequate regulation of hierarchical organizations, together with a lack of supervision, must be held responsible for the stability of a disastrous complacency of these organizations and their heads, and of their insensitivity to, and repression of, other points of view.
5. The inadequate regulation of hierarchical organizations, together with a lack of supervision, must be held responsible for the insensitivity of the top management of the supervisors for warnings and proposals from their own employees. The supervisors had more than 10,000 employees, many of whom were highly educated. It is unthinkable that none of them accepted the conclusions of the GAO of 1994-1999 and OFHEO's systemic risk report of 2003, and that none of them tried to bring the management to its senses. The fact that the management didn't listen and respond constructively proves its incompetence, if not its lack of integrity.
6. Employees had insufficient possibilities to get a hearing for sound arguments, and to ensure responsible operation of their organizations. Apparently, integrity codes and whistleblower regulations had insufficient practical significance.
7. The concept of "organization culture" suggests an equivalence of employees which in hierarchical organizations does not exist. Employees have to comply with norms and values set by the management. The concept "organization culture" can only have been invented to (wrongly) suggest that the top management cannot be held responsible for everything the organization does and does not. That it has to cope with an organization culture it does not approve of.
8. Discussions in governments and parliaments about matters pertaining to the financial system were characterized by a lack of common sense and sound reasoning. Governments and parliaments seemed unable to distinguish sense and nonsense, or refused to make this distinction. Maybe because it would threaten interests and/or unfounded but inviolable dogma's. They allowed or actively supported repression, and stifled critical discussion. They maintained regulation which permitted principal persons to manage their organizations as dictators, and which excludes self-correction.
9. Together with the absence of effective correcting forces, the repressive attitude of the politically appointed heads explains the stability of the supervisory and deregulation policy 1995-2007.
10. Present regulation of hierarchical organizations precludes early warning of society about activities or omissions of hierarchical organizations which create (great or even extremely great) social risks.
11. Even though the inquiry commissions were requested to discover the causes of the subprime crisis, they gave no attention whatsoever to the operation of organizations as organization, or to any of the preceding conclusions. They give no explanation for the fact that government and supervision have failed notwithstanding thousands of highly qualified experts.

Measures which seem necessary to prevent the observed dysfunctioning are listed at the end of this subsection.

Introduction.

The crises were caused by dysfunctioning hierarchical organizations. This subsection analyses the empirical evidence about the operation of hierarchical organizations as organizations that may shed light on the causes of the dysfunctioning. Organizations operate in accordance with, and within the bounds set by, applicable regulation. Therefore special attention is given to the relation between the dysfunctioning and regulation of hierarchical organizations. The subsection also explains how large organizations can dysfunction seriously notwithstanding thousands of highly qualified employees.

Much of the dysfunctioning can be attributed to dangerously inadequate regulation. The respons-

ability for the regulation lies with governments and parliaments. Only they make laws. Still, part of the blame for the fact that nothing is changed goes to the inquiry commissions. They were silent about all subjects mentioned in this subsection.

As usual in this study, the analysis tries to discover causes which are changeable. The analysis of this subsection makes quite clear what must be done to ensure that hierarchical organizations fulfill their duties, and to avoid that they endanger society. The result is the list of measures which concludes the subsection.

Most of the following concerns hierarchical organizations in general. But some specific discussions may concern only supervisors, or organizations with a public mission. This is not a serious restriction: with minor changes the text applies to organizations with other missions.

Hierarchy and dictatorship.

Someone who observes reality as revealed by the subprime crisis and other cases without prejudice will conclude that “hierarchical organization” is hardly more than an euphemism for dictatorship. Sometimes perhaps an enlightened dictatorship, but at other times certainly just as oppressive.^{171, 172}

Those who think that the word “dictator” is too strong should study some whistleblower cases, and realize that a dictator does not dictate everything for everybody. Dictating every detail is impossible. It is not in agreement with the facts of dictatorships which are generally acknowledged to be a dictatorship. A dictator is the head of a hierarchy. It is true that proportions and the consequences of contradiction are important and may (but need not) differ a lot.¹⁷³ But contradiction can easily be limited or prevented (or promoted!) by selection and seemingly subtle means.¹⁷⁴ And several whistleblower cases show that in hierarchical organizations in democratic constitutional states dissenters can be terrorized as if laws don’t exist. The difference between a dictatorship and a hierarchical organization is not fundamental but gradual. It is not hard to imagine a dictatorship which is mild as compared to some of the hierarchical organizations operating in and around the financial system.

That only few people see the heads of hierarchical organizations as dictators can be explained by:

- the use of the terminology “(hierarchical) organization” and the restriction of the terminology “dictatorship” to states which are far away from ours in space and time;
- the general acceptance of the idea that everybody has a boss;
- the general acceptance of reality as the norm;
- the success of the efforts of the management to give their employees the illusion that they have influence, and
- the selection of employees who perceive hierarchy as normal, good and/or necessary.

Another factor is the control of information by the management: employees do not know what is happening in other parts of their organization. They may not even know what orders have been given (“requests have been made”) to their own managers.

For many employees their job is their life, or a very important part of it. In general they want to keep it, and some of them are ambitious. This affects the way they look at their organization and its management. It is a matter of self-interest for many employees to try and interpret events which they observe in their organization positively.

Union of powers. Unity of opinion. The irrelevance of codes.

In hierarchical organizations there is no separation of powers. Execution, regulation and evaluation are in the hands of one and the same management; the same individuals. Which is of course a

¹⁷¹ Regrettably, the author knows of no reliable studies of this subject.

¹⁷² Of course, one will not notice repression if one always says yes and amen and believes in Leaders.

¹⁷³ Contradiction of the dictator: opposition.

¹⁷⁴ The experience of the author in more than one (hierarchical) organization shows that very little pressure is sufficient to silence most people completely.

fundamental characteristic of a dictatorship.¹⁷⁵ And completely contrary to what is considered desirable and normal in democratic constitutional states.

The absence of separation of powers is essential for the practical significance of codes of conduct, integrity codes, and similar sets of norms. The codes are made by the people who supervise compliance, including compliance by themselves. This presupposes integrity of the top management. However, in all cases considered we saw that the assumption of integrity of the top management is incorrect.

The run-up to the crises, the crises themselves, and the hearings, demonstrate the practical irrelevance of the codes. The Chronicle and appendices teem with examples. The following example is exceptional (and slightly comical) in its clarity:

«Integrity. To ensure trust in Fannie Mae, Fannie Mae must be trustworthy.

Every individual at Fannie Mae- from our Board of Directors to the Chairman and CEO to senior management to every employee- is held to the highest standards of honesty and integrity.

Integrity is woven into the Fannie Mae culture. As CEO, I strive to establish the highest standards of integrity by policy and by example. Our highly independent Board of Directors holds me, as CEO, as well as senior management and the entire company, accountable for our high standards of integrity. The Board of Directors and each employee sign explicit Codes of Conduct, which are available on our corporate Web site, fanniemae.com. Fannie Mae's corporate justice system and a range of checks and balances provide three-dimensional protection of our integrity.»¹⁷⁶

This is written by Franklin D. Raines, Chairman and Chief Executive Officer of Fannie, in his letter to the shareholders, in the first pages of Fannie's annual report 2002. He was lying:

«In September 2004, [Fannie's supervisor] OFHEO discovered violations of accounting rules that called into question previous filings. In 2006, OFHEO reported that Fannie had overstated earnings from 1998 through 2002 by \$11 billion and that it, too, had manipulated accounting in ways influenced by compensation plans.»¹⁷⁷

In Fannie several if not many people must have known about the fraud. Is it credible that everybody approved? In spite of having signed a Code of Conduct?!¹⁷⁸

For a simple employee, the union of powers may make use of the freedom of speech quite risky (supposing it applies). Everybody knows that free use of this freedom may affect one's career negatively, if not destructively. All cases in this study, and the report of the FCIC, show repression. None shows promotion because of justified criticism. In fact, the author doesn't know a single example of such a promotion.

Although the documents contain very little empirical information about it, in the organizations concerned with the financial system there must have been as many opinions as people. There must have been differences of opinion about the consequences to be attached to the risks pointed out by the GAO and to its recommendations. However, neither in their operation nor their annual reports can anything be discerned about internal reflection or discussion about these questions. Differences of opinion are never acknowledged.

The hierarchical structure of organizations, and the legal framework in which they operate, facilitate suppression of opinions differing from those of the top management. Everything in the organization depends on the openness, integrity and competence of the top. If these are seriously deficient, employees have no other choice than submission or departure.¹⁷⁹ The phenomenon is

¹⁷⁵ At least in practice, for in many dictatorships the three powers are formally separated. Of course, to mislead the population and help clients to defend the system.

¹⁷⁶ Fannie AR 2002 p. 5/7.

¹⁷⁷ FCIC report p. 122/150.

¹⁷⁸ Why has this not been noted by the FCIC?

¹⁷⁹ In this report, departure is seen as "passive selection", active selection being the procedure which the management applies when it wants to get rid of an employee and replace him or her by an other one.

remarkable, because it would be very easy for the top management to do it very differently. After all there is no real need for the unrealistic suggestion that the organization has only one opinion. On the contrary: logically speaking it is in general plain nonsense to suggest that there cannot be any doubt about the correctness of conclusions, decisions and policies of the organization (= its top management). In general the suggestion that there can be no doubt is simply stupid and misleading.

Quite apart from theoretical considerations, the Chronicle, annual reports, and hearings show very clearly that the internal checks and balances of organizations, if present, failed completely. This also applies to possible whistleblower regulation and codes of conduct. Nothing in the sequence of events betrays a positive influence of their existence.¹⁸⁰

The fiction of an organization culture.

The concept “organization culture” is misleading nonsense. The concept suggests an equivalence of employees which in hierarchical organizations is merely imaginary. Employees have to comply with norms and values set by the management. Not by what the management says, but by what it gives and does not give its signature; by who is and who is not promoted; and by who is given and never given a gratuity. In the end, all this is determined by the top, and by nobody else.

Experience shows that employees consider codes of little consequence, and ignore them. Instead, they closely watch the decisions taken by the management. Especially the decisions about promotions to and within the management. That is what (operationally) defines (embodies) the norms and values of an organization (the “organization culture”). Many employees never adopt these norms and values. They try to avoid dilemmas or try to find compromises between how they think things should be done and how they think the management wants them to be done. Thereby losing their chances for promotion. In other words: suggesting that the employees of an organization share an “organization culture” is misleading, and an insult to many employees. An organization doesn’t have a single culture. And the culture of an organization certainly is not defined by a published code. One should at least distinguish between the culture of the top management and the culture of most of the employees in the basis of the hierarchy.

The top of hierarchical organizations has an interest in making believe in the fiction of (a single) “organization culture”. If an “organization culture”

- would really exist,
 - would exist independent of the top management, and
 - would have characteristics hampering the proper operation of the organization,
- then it could also hamper the proper functioning of the top management. Belief in a single culture, voluntarily and collectively adopted by all employees of an organization, implies belief in a shared responsibility for everything that is happening in an organization, and for what it does in society. Someone who forgets the hierarchical nature of the organization and believes in a kind of autonomous organization culture may conclude that the top is the victim of this culture. Because changing a culture is difficult, or is at least said to be difficult, the fiction of an autonomous organization culture furthermore supports the claim that it is difficult to change an organization. But actually it is only a fiction. In reality the top defines and dictates the culture. The only thing needed to change the culture is to change the top.

The inquiry commissions treat organizations as single persons, ignore thousands of employees, and pay no attention to the internal operation of organizations.

The reports and hearings of the inquiry commissions show that their mental picture of hierarchical organizations is anthropomorphic.¹⁸¹ The commissions see an organization as a single person. None of

¹⁸⁰ A negative influence of the codes is its misleading or defrauding effect on prospective employees and outsiders. The codes suggest a guarantee. They are meant to suggest that the organization can be trusted. People did trust them, but the trust was not justified at all.

¹⁸¹ Anthropomorphic means: having human form, is like a human. In the present context: organizations are considered as, and thought and reasoned about as if they were people. They aren’t. Sometimes “doing as if” may be harmless. But often it is misleading, unjust, etcetera: simply unfounded and wrong. An assumption which

them questions the present day legal framework of hierarchical organizations. As a rule,¹⁸² the inquiry commissions see only the top of organizations, and seem to think that it is representative. However, there is no logical reason for believing that the formal representative of an organization represents the organization in any other sense. A hierarchical organization is not a democracy. The head of a hierarchical organization need not do or say what everyone or a majority of his employees thinks or advocates. The inquiry commissions do as if no distinction needs to be made between formal appearances and reality. They show no interest in the internal operation of these organizations. Even though they knew or concluded that in the years preceding its culmination none of the organizations involved in the crisis operated appropriately. They do not explain how this tallies with their assignment: finding the causes etcetera.

There is little in the reports of the CDW and FCIC, and in the reports of their hearings, that shows that the principal persons in supervision and government were heads of (very) large organizations. There is even less that shows that together they had more than 10,000 (ten thousand) employees.¹⁸³ If the principal persons show that they are aware of being member of an organization, it is hardly more than a formal recognition or lip service.¹⁸⁴ They never explain how it is possible that none of their brilliant, hard working employees¹⁸⁵ saw the systemic risk of mortgage backed securities, repo markets, etcetera, and why internal reports and warnings were shoved aside. The inquiry commissions didn't ask for an explanation. Nowhere do the principal persons report internal differences of opinion, doubts, discussions, proposals for policy changes and so on. Even though their absence is inconceivable. The principal persons don't behave themselves as representatives of the organization. They behave as if they are the organization; as if nobody else matters.

That the inquiry commissions pay no attention to the fact that organizations not only have a head but also a body consisting of thousands of employees is especially remarkable because the commissions were asked to find the causes of the subprime crisis. Of course one can conclude that by doing as they did, they implicitly confirm the egocentrism of the principal persons and the dictatorial nature of hierarchical organizations. Still, the commissions fail to point out that abuse of power by dictatorial managements may be part of the cause of the crises. They don't seem to see a need for explaining that government and supervision have failed notwithstanding thousands of highly qualified (educated) experts.

Repression in hierarchical organizations, and its dangers for society.

It is at any rate unbelievable that all employees were convinced that everything was under control, and that all of them were blind to the risks. Even if the education is inadequate, there were GAO reports too. The attempt of Born of the CFTC to make the OTC market more transparent was widely publicized. It is probable that Born acted on the initiative of employees, for that is how hierarchical organizations work. Just like Born, the heads of other supervisory organizations, and the Treasury (under)secretary, must have received this kind of signals and proposals.¹⁸⁶ There is no evidence of any adequate reaction. The managers must have thought they knew better, thought wishfully, or found political desirability and/or conformism more important than the requirements of their duty. And they had the power to ignore any signal or proposal, and to silence the messenger(s).

The reactions to the GAO reports and the initiative of the CFTC of those in power in the financial-

leads to erroneous conclusions. An *anthropomorphism* is an assertion or argument in which a non-human object is treated as if it were a human being. Always beware!

¹⁸² A minor exception is Moody's, in the FCIC hearings on 20100602. See the hearing reports under that date.

¹⁸³ The numbers of employees of the most relevant supervisors are given in the corresponding appendices.

¹⁸⁴ Wellink for example asserts that he means "we" when he says "I". While his material assertions are incompatible with the annual reports and OFS publications of his DNB.

¹⁸⁵ As they assert explicitly in their annual reports.

¹⁸⁶ The FCIC report gives several examples of signals which were ignored, but only or mainly in financial institutions in the restricted sense. Of course, the reports of the GAO of 1994-1999 are the most important example, but of external origin.

political world were no more than dogmatic wishful thinking arguments.¹⁸⁷ Nobody using his brains could and would rely on self regulation, and everyone using his brains and knowing the main facts would come to the same conclusions as the GAO and CFTC.¹⁸⁸

After Born had been shoved aside, every well-informed and thinking observer could conclude that the establishment didn't want to acknowledge the risks indicated by GAO and CFTC, and didn't want to do anything about them. He could conclude that the establishment would silence everyone pleading for more transparency or regulation. That Rubin and Summers (both of the Treasury), Greenspan (Fed), and Levitt (SEC) form a closed front, endeavoring to eliminate all opposition. This explains why since 1999 nothing is heard anymore in the vein of the GAO reports, or of the CFTC proposals. The situation must have been felt to be hopeless. Everyone had been terrorized.^{189, 190}

The BIS-CGFS reports of 2003 and 2005 can be presented as evidence showing that at least part of the employees of the supervisors knew better. The reports leave very much to be desired. They suggest a lot of compromising, suppression and repression. Which implies that quite a few of the employees must have taken the risks much more seriously than the establishment. It is remarkable that DNB and Fed, and probably most others, did little or nothing with these reports.¹⁹¹ However, in the context of this subsection the most important observation is that there were signals, not only in 1994-1999 but also in 2003-2005, and that the managements kept ignoring them.¹⁹²

If we take into consideration everything we know about hierarchical organizations, then it seems almost certain that there have been employees in all ministries and supervisory organizations who spoke up, but were not listened to by their management. And in case they didn't give up: there is unambiguous proof of repression.¹⁹³ Namely in the hearings of employees of Moody's and the case Born. The hearings speak for themselves. As regards the case Born: isn't it extremely improbable that persons like Rubin, Summers, etcetera, are more tolerant and open towards their employees than towards colleague Born? The case Born very clearly shows how these people handled common sense warnings.¹⁹⁴ In short: it has to be assumed that the principal persons got signals not only from outside, but also from their own employees. They ignored and repressed them all. As is clear from the quasi-arguments, facts and hearings, they did so for no good reason. The fact that warnings were not heeded can only be due to the concerted use of power by dishonorable and incompetent people.

Of course the inquiry commissions should have looked for the relevant facts and explanations. As it is, they say almost nothing about the internal operation of any of the organizations involved in the subprime crisis. They give it no analytical attention whatsoever.

Here it is concluded that from the large group of employees signals must have been sent up to the principal persons, accompanied by proposals for solutions. But only in too few exceptional cases did principal persons take them for what they were worth. In general top managements preferred stupid dogma's over common sense, and abused their power to silence dissenters in and outside their organizations.

¹⁸⁷ The Wiki-page about Brooksley Born calls the arguments "neoliberal" or "neoconservative". See the dossier or the Wikipedia. The page speaks of a "war of ideologies". This seems unnecessarily mystifying and politicizing. There is no need for difficult words or references to schools or ideologies. The supposed convictions of Greenspan et al were based on nothing more complicated than blind faith and/or wishful thinking. As Greenspan later admitted. If the metaphor "war" is applicable at all, then it refers to a war not of ideologies, but of sense against nonsense.

¹⁸⁸ Of course, the use of ideologies (= hypothetical or even falsified theories), is equivalent to not using one's brains.

¹⁸⁹ See also the episode about Born and Summers beginning after about 24 minutes in *Inside Job*.

¹⁹⁰ Merriam Webster 2002: terrorize= to fill with terror or anxiety.

¹⁹¹ A fact that isn't noted by CDW and FCIC.

¹⁹² Note that the GAO did note the OFHEO systemic risk report.

¹⁹³ At the same time nothing betrays any tolerance, openness or similar virtues on the side of the principal persons with respect to people having different opinions. Why don't the principal persons say anything about internal discussions? Have no such discussions been held? Of course there were. It is all very strange. Because minutes are made of almost all serious meetings in organizations this could be checked easily. At least if you really want to find causes, and really want to explain.

¹⁹⁴ In *Inside job* Gnaiza says that he personally warned Bernanke. Bernanke showed no sign of relevant thinking.

From this it follows that:

- The political system appointed dishonorable incompetent principal persons who did not understand risks, denied and/or underestimated them, and so on; did not understand or ignored signals from their employees, or rejected them without sound arguments; and could not or did not discuss them properly. The principal persons were not open but repressive.
- Employees had insufficient possibilities to get a hearing for common sense. Apparently, integrity codes and whistleblower regulation had insufficient practical significance. The hierarchy operated as a repressive dictatorship.
- Governments and parliaments may not have realized the dangers of the combination of hierarchical organization and inadequate heads.¹⁹⁵ They did not supervise properly. They weren't able to distinguish sense and nonsense, or refused to make this distinction because it would threaten unfounded but inviolable dogma's, interests or whatever. They supported or participated in repression, and stifled critical discussion. They maintained regulation which permitted principal persons to manage their organizations as dictators, and precludes self-correction.

Conclusions.

The above shows and explains the possibility of long term dysfunctioning of hierarchical organizations. Prime causes are the (political) appointment of unsuitable heads in combination with de facto nearly absolute powers, and the absence of adequate checks and balances. Heads of hierarchical organizations, especially (semi) governmental organizations, have the possibilities to stay in power regardless. Their formal accounting obligations are limited, and their practical accounting obligations almost nil. The chapters about the Dutch ministry of education, the whistleblower cases, and the hearings of the employees of Moody's by the FCIC show without exception that asking attention for dysfunctioning have only one result: repression of the employee-messenger. The law facilitates this. The conduct of ministers in and around the cases suggests that this is intentional. In the given circumstances there is no incentive for self correction.

The observations of this subsection furthermore explain why the quality of an organization need not be proportional to the number and quality of its employees. Neither is it proportional to the relative number of highly educated employees. It is the quality of the top, and especially its integrity and openness, which determines the quality of an hierarchical organization. The subprime crisis and other cases show that as a rule this quality is very insufficient.

The insufficient integrity and competence of the top can be blamed on

- the unsound way of appointment of these people;
- the implicit selection of people who imagine being able to do the impossible;
- the lack of incentives for proper fulfillment of duties, or the lack of sanctions for non-fulfillment.

In other words: the lack of liability and punishability. Notwithstanding the kind and reasonable impressions heads make in public interviews, when cameras and microphones are absent they may behave as repressive dictators with impunity, using their power to create a glorious image of themselves and their organization, and keeping information about dysfunctioning indoors. For employees there is almost no protection against retaliation for voicing criticism. They can do nothing if the top ignores its own code of conduct or similar codes.

It should not be forgotten that the situation means great injustice with respect to everybody who stood up for society and was silenced explicitly or implicitly, and was consequently limited in his or her personal development and career. Most of all towards people who were "selected away" because they didn't want to work in organizations with two faces.

In a theoretical analysis, the hierarchical character of an organization can be distinguished from the appointment and quality of the top. From a superficial theoretical point of view a hierarchical organization could have an adequate top: honorable and competent. But upon reflection there are seen

¹⁹⁵ If they wanted to abolish the safety net of liability they should have understood. Governments and parliaments should know what they are doing, and otherwise not meddle.

to be at least three problems:

- If the duties of the top are too extensive and/or difficult, and/or require more than any human being can provide, then nobody is truly competent. Somebody who nevertheless claims so is by definition dishonorable;
- Dishonorable and incompetent top managers have plenty possibilities to keep themselves in power;
- It is in their interest to help and shield each other. It is also in their interest that there are no honorable and competent people in their neighborhood. Such people could expose them, and might feel obliged to.

The phenomena indicated in the last two points can be seen in all the cases studied. Possibly the best in the history of the subprime crisis (including its official inquiries).

Finally it should be noted that repression of criticism in hierarchical organizations increases the risks for society. The risks for society are increased already by coloring the concepts critical and criticism negatively. It is harmful to suggest that a critical attitude means a pessimistic and negative attitude. It causes systematic underestimation of risks. In the selection of employees it may be understandable that preference is given to people who make no or less “difficulties”, but is risky as well. Especially when this is done systematically, and all managers are “optimists” disliking (thinking) “pessimists”.¹⁹⁶ In general the selection bias results in a population of employees who are (relatively) docile, and either do not reflect, or only tell their managers what they think if they expect a positive reaction. Often the top is intolerant with respect to other opinions than its own, and does not want to hear other opinions more than once, if at all. As clearly demonstrated by Greenspan, Summers and others in the case of the financial crisis, and in the cases in the Dutch education ministry.

By this mechanism hierarchical organizations make themselves blind to misconduct, errors and risks. Including risks for their environment.

The following measures seem to be necessary to prevent the observed dysfunctioning:

1. All jobs, duties, etcetera should be executable properly, given formal responsibilities. Including or especially the jobs of the top managers and heads of organizations. Sometimes this will require reorganization, for example by redistribution of formal responsibilities, splitting up of organizations, and sometimes discontinuation of certain activities;
2. The dictatorial form of the hierarchical organization, without separation of powers, should be abolished. Organizations should have believable mechanisms for the maintenance of codes and for (self) correction;
3. Selection and evaluation procedures should ensure that people are evaluated as regards honorable and competent fulfillment of duties. (This presumes point 1, and excludes political appointments);
4. Suppose that in an organization with a public purpose such as supervision there are different well founded opinions about the fulfillment of the duties of the organization. Then these should be made public, together with their substantiation, at least in the annual reports of the organization. Difference of opinion is normal and should be tolerated and functional. The pretension of certainty about any single opinion is misleading and dangerous;
5. Liability and criminal law should be aimed at preventing causation of damage, and at reparation or compensation if damage has been caused. It should prevent dysfunctioning that can cause unbearable risks. It should therefore also prevent appointment of dishonorable and incompetent employees;¹⁹⁷
6. If the management does not adequately respond when an employee reports dysfunctioning, then the employee may appeal to an independent outside judge. (In accordance with separation of powers). If the judge declares that the report is well founded, then the employee should be rewarded, and the dysfunctioning employees compensate all costs they have caused to be made. Including the costs of the correction of the effects of their dysfunctioning. In addition they should

¹⁹⁶ Note that this goes a far way towards explaining the systematic character of (project) budget overshoots.

¹⁹⁷ Again: 1. “Incompetent” means: not sufficiently competent for the given function; 2. Everyone on the paylist of an organization is called “employee” in this study. Including the CEO and other top managers.

be punished. They should be evaluated (by people independent of the organization) to see whether they are fit for their functions. In general this will entail a change of function or dishonorable discharge (for proven unsuitability). The employee who rightly reported keeps his function. Obstruction of this employee will be punished with dishonorable discharge.

Most of these measures will return in this or another form in chapter 9.

5. No supervision of supervision. Supervision and government policy: a risky combination.

The Chronicle, the annual reports and other reports of the supervisors, and the reports of the CDW and FCIC show clearly that governments and parliaments have failed utterly in their supervision of the supervisors. This may even be a misleading understatement. It may be more correct to assert that they did not supervise the supervisors at all, except to make sure that supervision did not interfere with their reckless policies.

Both in the USA and the Netherlands attentive reading of the annual reports of the supervisors was enough to see that the supervision was inadequate. Already at the time of their publication. For substantiation the reader is referred to the appendices, and of course to the easily accessible annual reports themselves. The reports are not adequate as reports. They do not report properly about the activities. Of some important activities nothing is reported.

Not only the responsible ministers and parliament could and should have known this, but the media too.¹⁹⁸ It could and should have been known to everyone concerned with the financial system that the supervision was inadequate, and that this greatly increased the risks inherent in the financial system. Everyone could have noted that none of the supervisors, governments and parliaments reacted adequately to the analyses and recommendations of the GAO of 1994-1999, and those of OFHEO and GAO of 2003-2004. Even though these reports explicitly concerned systemic risk. Everyone should have understood that the relevance of these analyses and recommendations grew even faster than the financial system itself.

The annual reports (and other reports) could and should have given rise to questions for the supervisors. Material questions too. But questions were not asked. In the years 2000-2010 no improvement of the annual reports is noticeable.

The crisis is a confirmation of the failure of the supervision of the supervisors. The crisis is the empirical proof of what is shown by analysis of the documents.

It is not difficult to imagine mechanisms enabling people outside government and parliament to contribute to the supervision and where necessary correction of supervisors. Citizens could be given the right to appeal to a specialized independent judge with complaints about a report of an organization which is paid in a large part by taxpayers money. The judge could assert that the report as such, or matters which are referred to in the contents, are not up to specified generally accepted standards. The judge could order correction. He could set a time limit for correction. He could fine responsible employees, or have them fired, because of proven lack of integrity and/or competence.

Obviously such judges and their assistants are not to be appointed directly or indirectly by (ex)politicians.

It is not self evident that a given system of supervision covers all relevant institutions and activities. At several points the FCIC mentions unregulated and quasi-regulated activities. The attempt of Born of the CFTC to get OTC regulated more effectively cost her her job. The organization of the supervision is a form of regulation, and therefore the responsibility of government and parliament. It is their responsibility to organize and regulate the financial supervisors in such a way that the financial system operates for the benefit of the general welfare, and operates without making innocent victims. In part, governments, parliaments and supervisors seem to have failed as a consequence of belief in self-

¹⁹⁸ It is true that it may be a problem that a majority in parliament is simply dumb, acting authoritatively and irresponsibly, without proper argumentation. Just using the power of the majority. Obviously, citizens should have possibilities to do something about such a situation.

regulation and deregulation. In the first place they should never have believed any such thing. The belief was based on unproven illusions. The belief proves their inability to reason properly. The use of such a belief as the foundation for the execution of a highly responsible job proves their utter incompetence. But even if some form of belief is considered acceptable, then the knowledge that not everyone believed should have made them realize and accept the possibility that they were wrong. They should have understood that a mistake of this type might have disastrous consequences. They should have managed this risk. They didn't. They put all their eggs in one basket. So once again they did not behave as professionals but as reckless gamblers.

Many words have been wasted on the powers of supervisors. They are wasted and misleading because in the run up to the crisis their powers have never been a problem. See the annual reports of the supervisors. There were big problems with supervision, but they had nothing to do with powers. The supervisors had many more powers and possibilities, but appropriate use of the freedom to publish annual reports would have been enough to prevent a subprime crisis.¹⁹⁹ As long as a supervisor can inform government, parliament and the public, there need not be a problem of powers. Government and parliament have all the powers they want. The real problems of 2000-2010 were that the supervisors were authoritative and repressive, that their policies were dominated by faulty dogma's, and that they had no risk management. This was combined with the failure of parliaments and governments to supervise the supervisors. Parliaments and governments too were dominated by faulty dogma's and the absence of risk management. Their attitude seems to have been based on the idea that everything goes well of its own accord.²⁰⁰ The Fed completely (= 100%) ignored one of its four main responsibilities: that of «[maintaining the stability of the financial system and containing systemic risk that may arise in financial markets](#)».²⁰¹ Administration nor Congress seems to have noticed. At any rate they took no action. Why worry if all goes well?

The conclusion must be that there were and are big problems indeed, but that they had nothing to do with powers. And it should not be forgotten that giving dishonorable and incompetent people (more) powers definitely creates (new) dangerous risks.

Governments and parliaments want all kinds of things, often without bothering about contradictions (and costs). As a consequence they may create conflicts of interest or unsolvable problems. These may be transferred to supervisors. For example if they are not only to supervise ([to ensure the safety and soundness of the nation's banking and financial system](#)), but also to take account of government policy.²⁰² In other words: supervisors may have to compromise between their supervisory duties and contributing to government policy. The alternative may be: obstructing government policy. In such a situation it may be impossible to fulfill a supervisory duty properly. This conflict is evidenced in the Fed. A quote in the FCIC report from its hearings shows that the Fed perceived affordable housing policy as a priority.²⁰³ It is clear that this means asking for problems.

It isn't clear whether other supervisors had to take account of governments policies as well, or wanted to do so voluntarily. At any rate they say nothing about it in their annual reports.

The inquiry commissions say nothing about this.

6. Inadequate appointments.

¹⁹⁹ No democratic government can afford to discharge one critical supervisor head after another. Let alone discharge a group of concurring supervisor heads.

²⁰⁰ And perhaps that somebody would blow a whistle when something was wrong. This would have been inconsistent and wishing against better judgment, for they themselves had done everything they could to silence critics. Especially by the regulation of the hierarchical organization, appointment of repressive incompetent heads, and allowing the terrorizing of whistleblowers. For the last see the following chapter.

²⁰¹ Fed AR 2006, p. 5 of the pdf-file.

²⁰² «[The Federal Reserve must work within the framework of the overall objectives of economic and financial policy established by the government](#).» p. 3, Functions and purposes of the Fed. Brochure, in the directory USA/Fed.

²⁰³ See the Fed Appendix, the quote of Fed governor Susan S. Bies in the FCIC hearing of 11/10/10. See also FCIC p. 21/49.

Summary and conclusions.

The failure of all principal persons in and around the financial system in the years 2000-2008 can be explained by the combination of election and appointment processes, and the absence of liability and punishability.

Trying to get elected for an impossible job requires lack of integrity. The procedure obviates the need for competences other than that of getting elected. The elected depends on the loyalty of his peers and his close associates. Honorable and competent people don't feel at home in this company. They are a threat for those who do like this company. They are a threat to be kept out.

All heads of government organizations and agencies are appointed by elected politicians. The CV's and past records of these politicians show that there is no reason to assume that they are capable to judge the suitability of people for these jobs. The history of the crisis and other cases confirm what may be expected a priori: that the heads were not suitable. Experience suggests that they may have been selected chiefly for their stubborn adherence to the prevailing political dogma's, and for proven loyalty.

These observations explain the failure and its systemic character. The combination of actual election and appointment processes, and the absence of liability and punishability are a dangerous weakness of the "democratic constitutional state". The subprime crisis and other cases show that they can have disastrous consequences.

■

As regards the integrity and competence of the principal persons the facts are clear. The analysis is straightforward. This simplicity is more than offset by the difficulty of the problem that they bring to light.

This subsection is restricted to the principal persons in the public sector. In the context of this study attention for the appointment of these persons is useful, and attention for the appointment of the principal persons in the private sector is not. The reason being that a decent law and suitable principal persons in the public sector are both necessary and sufficient to prevent crisis like the subprime and government debt crises and other avoidable disasters. A decent law and integrity and competence in the public sector will automatically lead to improvements in the private sector. The public sector is the key. The private sector operates under supervision of, and within regulatory framework made by, the public sector. Which is not to say that understanding of the role of the principal persons of the private sector is not important. It evidently is. It is evaluated in the section *The principal persons*.

The principal persons in the public sector are either politician or appointed by politicians. The most important politicians are elected. Government and parliament appoint the heads of almost all organizations in the public sector. Major problem is that the most important officials of the present day "democracies" are selected by the worst procedure. Namely elections.²⁰⁴ Elections on the basis of inadequate information. Mainly on the basis of artificially created images, and assertions and promises which do not bind the candidates. There need not be the least correlation between image and reality, and often they are very different indeed. All important appointments and developments in the world nevertheless depend on elections. As a consequence of the election process the most powerful persons are in many respects the least suitable, and the most dangerous. Few people have a more exaggerated opinion of themselves, more false pretensions, and less scruples about misleading and harming the public ("if necessary").

Dishonorable and incompetent people can be nominated safely, because they are only really accountable towards their friends and colleagues. As regards their functions they are not liable or punishable. Citizens cannot start a lawsuit against them for what they did or do in an official capacity. Public prosecution is under control of the government (or people appointed by the government). In other words: under control of friends or colleagues.

The ability of getting elected does not imply the ability for public office. Indeed, there is little or nothing in the CV's, or rather, the past records, of most members of governments and parliaments that

²⁰⁴ Under inadequate boundary conditions. For example with respect to financing and non-binding promises.

shows suitability for functions in government or its supervision.²⁰⁵ The CV's or past records give no reason to suppose that they are capable of ensuring the adequacy of regulation or to supervise public administration and governmental agencies. Their pretence exceeds their competence by far. For all principal persons of the crises, the facts clearly show that their pretensions about suitability were false. Already the fact that these people never show any serious doubts about their opinions and proposals, is proof of a dangerous lack of self-knowledge and lack of understanding of the uncertainty of human knowledge.

It is true that specialized education and experience is not always necessary even for an apparently specialized job. However, the ability to apply common sense, the ability to learn and use what has been learnt, the will and ability to discover things, and the willingness to accept and defend findings, are essential (though not sufficient). Of course these abilities should not be pretended but proven. All of them and more were missing in the principal persons and in the public manifestations of their organizations. The principal persons did not learn. They did not accept the findings of sound analyses (as of the GAO). Instead of open, the principal persons were dogmatic. They defended ill founded fictions at all costs, including dishonorable. Witness Born. Only irresponsible stubbornness and repressive use of power can explain that even thousands of highly qualified employees were unable to change one-sided policies based on evidently risky fictions.

Regarding the ability of politicians to appoint suitable heads of government organizations (including agencies) the following may be noted. The CV's and past records of politicians show that there is no reason to assume that they are able to evaluate competencies and integrity of people, and their suitability for a given job. (Supposing- against better judgment- that they understand what a job requires). On the basis of the cases and their vital personal interest it must be assumed that in selecting people, they give priority to loyalty and the ability to talk oneself out of every problem. The last at least in appearance, in the absence of good questions and opponents who don't accept nonsense. All facts presented in this study are consistent with the hypothesis that loyalty towards one's peers is an inviolable priority,²⁰⁶ and that among the principal persons integrity and competence was utterly insufficient. In fact, the incompetence can serve as an explanation of the loyalty: someone who lacks necessary competence can only maintain himself with the support of his likes.

7. Deregulation.

Summary and conclusions.

“Deregulation” is an ambiguous concept that can better be avoided. A smaller number of rules can mean more and heavier restrictions, obligations, formalities or whatever, and vice versa. In the prehistory of the subprime crisis it meant more freedom irrespective of the consequences for outsiders.

The belief that deregulation- insufficiently restricted freedom- benefits the general welfare, is incompatible with common sense, experience, and the results of analysis the prisoner's dilemma game. The PD-game shows that regulation (restriction of freedom) and effective supervision can be in the best interest of both the specific economic sector and society as a whole. Not the quantity of the rules is the problem, but their quality.

This kind of analysis is confirmed by many practical situations where only fools would propose deregulation. Advocating deregulation is proof of disqualifying incompetence.

It has to be assumed that the deregulation policy has had a undermining influence on the effectiveness of supervision.

²⁰⁵ Many CV's can be found in the Wikipedia and other pages of the internet. The reader should be warned. In general they are not reliable. Many or most (>90%) of the CV's are positively colored (up to and including adulatory). They should always be compared with past performance. Many CV's of principal persons of the subprime crisis cannot stand this test. Important examples are Geithner, Greenspan and Summers. Of course, the incompatibility gives rise to questions. In the present case, one can better study the Chronicle and the underlying sources, and judge the CV's on the basis of the facts.

²⁰⁶ Was Born forced to leave for violating *this* code?

The deregulation policy is a good example and proof of the stupidity of the people responsible for the operation of the financial system, including many economists. It is proof of a failure to learn, and of a failure to (understand and) apply available knowledge. Notwithstanding government organizations with thousands of highly educated employees.

In the first place the word “deregulation” is ambiguous and misleading. The fact that politics and enterprise advocate deregulation definitely doesn’t mean that they are converted to anarchism. The point is that a single fundamental or general rule can mean more than hundred specific rules. Very many rules could be abolished if liability and punishability would be accepted as general principles of law in the sense described earlier. This would make the law much more understandable too. But this kind of simplification (deregulation) is certainly not what politics and enterprises want. They don’t want more liability and punishability. They want freedom without duties or obligations. Anyway, use of the word “deregulation” ignores the fact that a rule can mean much and little. Less regulation need not mean more freedom or less bother. Not the number of rules or “amount” of regulation matters, but their contents.

In the second place unqualified deregulation policy ignores that

- some rules are meant to prevent innocent people from being harmed by avoidable actions or omissions of other people;
- rules can solve problems, and/or increase efficiency.

For these same reasons a group of (wise) people can voluntarily appoint or accept a referee or judicial system. This seems not to be known to the preachers of deregulation. They don’t seem to be acquainted with the prisoner’s dilemma either. Regrettably, one could not have learnt it from the textbooks of Heertje and Sloman. See the section on education, 7B.2. The prisoner’s dilemma is a model for (= simplified version of) situations in which it is beneficial for a group of people or organizations to accept a set of rules, and to pay costs to ensure compliance with these rules. One such situation is that of competing enterprises. Another that of competing athletes or football teams. In fact, what contest would be possible without rules and a referee? Observation of the rules is not self-evident. It may be profitable for any separate enterprise or contestant to ignore the rules. Belief in self-regulation therefore proves incompetence: absence of knowledge and understanding which are absolutely necessary for one’s job, and could and should have been present.

Conversely the absence of rules and supervision in this kind of situation will in general give suboptimal results. Where it should be realized that “suboptimal” includes “disastrous”. During a long term of absence of rules and supervision a bad situation can grow worse, if people take more and more liberties to keep up with the competition, or try to overtake the competition and win a bigger market share. As happened and happens everywhere, and especially in the financial sector in 1995-2008. Do you think that baseball or football would benefit from abolishment of rules and umpire?

This is not to say that all rules are beneficial or necessary. No doubt there are foolish and unnecessarily harmful rules. But examples don’t warrant generalization. Generalization means throwing out the baby with the bathwater. As the crisis showed on a very large scale.

The idea of deregulation can be seen as an implementation of “liberalization” and “liberalism”. The Merriam-Webster of 2002 describes “liberalism” as follows:

«[2b:] a theory in economics emphasizing individual freedom from restraint and usu. based on free competition, the self-regulating market, and the gold standard

[2c:] a political philosophy based on belief in progress, the essential goodness of the human race, and the autonomy of the individual[,] and standing for the protection of political and civil liberties

[2d:] the principles and policies of a Liberal party.»

The most tragical- though revelatory- of the concept and this description is that it only mentions the actor. It completely ignores other people. It makes no mention of any boundary condition. On the contrary: it mentions “freedom from restraint”. It ignores the problem it implicitly raises: that not only one single individual, but all people have the same right to freedom.

Much misery in the world can be understood as a consequence of the fact that to a large extent, law and politics are characterized by this very same near-sightedness. There is very much attention and priority for the freedom of actors, and very little for due care and guarantees for others. The prevailing attitude of top politicians, managers and administrators means a step backwards with respect to the freedom principle as formulated in the *Declaration of the rights of man and citizen* from the French

revolution.²⁰⁷ Article 4 asserts:

«Freedom means that everything is allowed that does not hinder anyone, so that the exercise of the natural rights of everyone can only be restricted in order to guarantee the exercise of the same rights by others. The restrictions can only be determined by law.»

The validity of this article is confirmed in the preamble of the French constitution of 1958.

More or less by definition, someone respecting himself will only voluntarily agree with a freedom principle if it is combined with the safeguarding principle. The safeguarding principle is a logical condition for communication. No law or government can change that.²⁰⁸

The Chronicle and the FCIC report show that it is actually an understatement to say that the political climate of 1995-2008 was characterized by deregulation. In crucial decision making processes the climate was rather anti regulation. The gospel preached by Greenspan and the apostles of the financial system dictated: no rules but self-regulation. It is obvious that this must have undermined the morale of the supervisors, and weakened their position with respect to the institutions they had to supervise. This is no excuse for the supervisors: they were at least formally independent. But it underlines the irresponsibility of Greenspan, and of the people, governments and parliaments who advocated or condoned similar stupidities.

8. Housing policy: affordable housing policy, community reinvestment act and tax deduction for mortgage interest payments.

Summary and conclusions.

1. The Chronicle and the study of Wallison (FCIC) show the disastrous and fundamental role of the authoritarian and unprofessional implementation of the AH and CRA policies. It is plausible that the influence of these policies has been amplified by the idea that the government is the boss of the country, and should be obeyed; and by the “American Dream” rhetoric of successive US presidents, which precluded an open and critical discussion.
2. The FCIC majority downplays the role of the AH and CRA policies, and asserts that pursuit of profits was the cause of the deterioration of the quality of mortgages. Its conclusion is incompatible with contemporary evidence, and logically incorrect. Both the argumentation and the method of inquiry of the FCIC majority in this case are inadequate. They give rise to the suspicion that the conclusion is biased intentionally, and that the FCIC uncritically adopted the view of HUD. (Which was responsible for the AH and CRA policies).
3. In several countries tax deductibility of mortgage interest payments is used as a means to promote home ownership. The deductibility reduces the amount of taxes received by governments. Around 2010 Dutch politicians started bothering about budget deficits and government debt. In order to reduce them, they looked for ways to increase taxes. Abolishment of the deductibility of mortgage interest payments was considered a good idea. Just as good as the introduction of the deductibility several decades earlier. Abolishment was accepted by government and parliament. The consequence was a general and substantial impoverishment of the population. This and other tax increases mean more power for politicians. Politicians effectively punish the population and reward themselves for decades of spending more than was available.

The AH and CRA policies.

The Chronicle shows that the government policy with respect to the American Dream of home ownership was the ultimate cause of the poisoning of the securities which caused the crisis. The subprime crisis would not have happened without the AH and CRA policies. There is no indication that HUD, the government department for housing and urban development, inquired into the feasibility of (especially) the affordable housing goals before dictating them. There is no indication that the responsible politicians have tried to find out whether the steadily increasing housing goals

²⁰⁷ *Déclaration des droits de l'homme et du citoyen*. Dated 26/8/1789.

²⁰⁸ The safeguarding principle was explained before. For its logical nature, see *The law of logic* (Het recht van de logica) or *Communication and norms*. Bibliographical data were given before.

could be realized without lowering mortgage requirements and substantially increasing the risks for mortgage sellers and buyers. On the other hand it is clear that HUD exerted pressure on mortgage sellers, and that HUD and supervisors received and ignored signals about increasing risks. The process resembles that of the planning economy of the Soviet Union in the first half of the 20th century. The goals have to be realized willy-nilly. Don't look before you leap. That was the motto for the implementation of the American Dream.

The role of the government policy with respect to home ownership is obvious and simple. It was thoroughly chronicled and analyzed by Pinto and Wallison. Their reports are in the dossier. For this reason there is no need for more analysis of this subject in this chapter. Two aspects remain to be mentioned however. The first is the influence of the AH and CRA policies on the supervisors, and on Fannie, Freddie, and other financial institutions. All cases concerning policy implementation show that actors tend to conform themselves to the perceived wishes or policy of government officials. That is: they show a debatable form of submissiveness. Many people and organizations do as if the government is the head of society and has to be obeyed. They may be formally independent, and it may be their duty to act independently (for good reasons). But in practice they rarely do. It probably helps that the government selected heads of the supervisors who would not jeopardize their policies.²⁰⁹ Because of this experience it has to be assumed that supervisors try to avoid actions that may thwart realization of government goals. So the housing policy and deregulation policy had the same effect: that of weakening supervision.

The second aspect is the influence of the ("American Dream") rhetoric around the AH and CRA policies. That is: the influence of formulations of policy goals intended to make everyone support the government, and opposition difficult or impossible. The Chronicle gives examples of such statements by presidents. Annual reports of Fannie give more examples.²¹⁰ This kind of rhetoric is harmful and dangerous because it precludes criticism and open discussion, which are of vital importance to reduce risks. Given American attitudes, the rhetoric cannot have left the supervisors untouched.

Wallison vs the FCIC majority: a methodological analysis.

Regarding the influence of the AH and CRA policies and their implementation, the FCIC minority report of Wallison leaves nothing to be desired. It is clear and well substantiated. His report only suffers from one-sidedness: the role of other factors is belittled without sufficient arguments. In general Wallison's argumentation about the non-causal character of other factors is convincing. But a non-causal factor can still have had a facilitating or amplifying effect. Competent action by supervisors, instead of negligence based on erroneous dogma's, could have prevented the crises. But from the point of view of the present report it is more important that Wallison's report is a correcting complement to the FCIC majority report. In fact, Wallison wrote his report because the majority trivialized or denied the role of the AH and CRA policies. So the question arises: what is wrong with the inquiry of the majority? How can one see from their report that something is wrong with it?

For the answers to these questions the section *Affordable housing goals: "GSEs cried bloody murder forever"* of the majority report is crucial. It is mainly based on "information" from hearings of principal persons by the FCIC. That is: hearings of people who are responsible for the operation of a part of the financial system, and have an interest in a favorable representation of the prehistory of the crisis. They actually are suspects. For this reason their "information" should never be accepted as true or reliable without corroboration and (comparative) analysis. Interviews with potential suspects can supply ideas, especially at the start of an inquiry. The following step should be: finding and analyzing facts and contemporary documents. The FCIC majority concludes that all the persons it has interviewed functioned inadequately in the run up to the crisis. Therefore these persons cannot be considered as experts and reliable witnesses.

As the source of information about the influence of the AH goals on the safety and soundness of the GSEs the FCIC majority uses an employee of HUD...:

«The former HUD official Mike Price told the FCIC that while the "GSEs cried bloody murder

²⁰⁹ Of course this is a strong argument against the appointment of supervisors by governments.

²¹⁰ See especially that of 2001, with the unbelievable cover: "The American Dream Decade". This refers to 2001-2010.... It is copied in the appendix Graphs, 7C.11.

“forever” when it came to the goals, they touted their contribution to increasing homeownership. In addition, Price and other HUD officials told the FCIC that the GSEs never claimed that meeting the goals would leave them in an unsafe or unsound condition.»

Apart from the (tendentious) exaggeration, the “cried bloody murder” agrees with the later annual reports. But the last assertion doesn’t. If the FCIC majority had studied the relevant contemporary documents, there would have been no need to ask Price this question. Even if the FCIC was not aware of these documents, it should not have questioned HUD about opinions of GSEs. For HUD has an evident interest in downplaying its own role and suggesting recklessness of GSEs. For the reasons given and to be given, the question is suspect. As if the FCIC majority wants to prove something that it knows not to be true.²¹¹

In the first place there were annual reports. See the Chronicle, the appendices and the annual reports themselves. The FCIC should at least have mentioned and discussed them. Next, there should be minutes of all more important meetings of GSEs with HUD. And finally there must have been correspondence between GSEs and HUD about the goals and other matters. The FCIC could and should have asked for them. If necessary the people concerned could have been asked for elucidation. The fact that there is no indication whatever that the FCIC majority did any of these things, shows at least that this part of its inquiry was inadequate from a methodological point of view. But it also gives rise to the question whether the FCIC acted in good faith. Wallison does use contemporary documents, and he hardly uses interviews which took place after the facts. That’s why his approach gives a very different picture.

On the basis of its interviews, the FCIC majority asserts that not the AH or CRA policy but the pursuit of gain was the principal motive of the GSEs. Because of both the very precise realization of the goals and the annual reports this does not deserve belief. If profit maximization was their primary purpose, why didn’t they realize much higher percentages, or the same percentages earlier? As the annual reports explain, and the FCIC majority does not refute, the argument about the primacy of profit is incorrect. The point is that taking more risk reduces profits. In its 10K forms, Fannie says that it must take more risk in order to realize the AH goals, and therefore put up with a smaller profit. The annual reports show that Fannie gave priority to the AH goals. The blindly increased goal percentages explain the increasing numbers of delinquencies. Without AH goals and with profits as primary purpose this defies explanation. The text of the FCIC majority contradicts the contemporary documents of the GSEs, and is logically untenable.²¹² Fannie’s 2004 10K form is crystal clear.²¹³ Of course annual reports can lie as well. But in this case they are logical and consistent, while the story of the FCIC majority is not. The whole approach of the FCIC of this subject is suspect, and seems biased. The FCIC doesn’t even mention the annual reports, let alone refute the relevant sections. Finally, if the FCIC majority were correct, then the AH and CRA policies would have been superfluous. In the prehistory of the crisis, they obviously were not thought to be so.

Tax deduction of mortgage interest payments.

The US had its AH and CRA policy, but governments of other countries had their own policies and regulations to promote home ownership. An important regulation is that of tax deductibility of mortgage interest. For example in the US and the Netherlands interest paid for a mortgage can be subtracted from gross income when calculating taxable income.²¹⁴ This means that the effective interest rate is between 1/2 to 2/3 of the rate paid to the mortgage seller.

When everything else remains equal, lower interest rates make homes more affordable. They increase the number of people able to buy a house, or a more expensive house. And vice versa. Similarly, introduction of tax deductibility of mortgage interest lowers monthly costs, and increases home prices. In fact, the prices of all homes rise, and the wealth of all homeowners is increased.

²¹¹ If you want to “prove” something that isn’t true, this is how to do it. Select the person you expect to give the desired answer.

²¹² The Chronicle of January 2010 suggests that the FCIC has adopted the view of HUD.

²¹³ See especially p. 47/52. This is in the section risk factors, but includes some reporting.

²¹⁴ In the US at least since 1986, and up to and including June 2010. See Pinto 20100814 pp. 37, 150 and 151. The deductibility exists in more countries. Because it didn’t seem to serve a useful purpose, no effort has been made to compose a list of countries.

Conversely, reduction or abolishment of the tax deductibility will in general decrease the home prices and the wealth of homeowners. If prices of economic goods are determined by their proceeds, and if the tax on the highest part of income is about 50%, then tax deductibility means that half of the interest paid is returned to the tax payer. This again means a change in value of the home of about a factor of 2. Because for many people their house is a large part of their property, and because mortgage interest is a significant part of people's incomes, this part of tax law and policy has important consequences for people's welfare and well being. It follows that changes in this kind of regulation can make home owners much more or less wealthy.

The regulation has important consequences for the tax incomes of governments. A schematic calculation suffices to get an impression of the difference between deductibility and non deductibility. Let the monetary value of the total volume of houses be called H. Suppose the average mortgage interest rate is $100xR\%$.²¹⁵ Suppose that 50% of the mortgages has been redeemed. Then the interest paid by home owners is $R \times (0.5 \times H)$, and the tax foregone is 0.5 times this amount: $0.5 \times R \times (0.5 \times H) = 0.25 RH$.²¹⁶ If the average mortgage interest rate is 4%, then $R = 0.04$ and $0.25 RH = 0.25 \times 0.04 \times H = 0.01 H$.

In general there is also a property tax. In the Netherlands and around 2013 it was 1.2% of the property value. Reduction of home prices by 50% therefore costs a government every year $0.012 \times 0.5 \times H = 0.006 H$. The Dutch government explains or motivates the 1.2% as a kind of income tax on a fictitious 4% interest rate. The 1.2% is fixed by law.²¹⁷

So if the interest rate is 4%, government tax income increases by $0.010 - 0.006 H = 0.004 H$ if the deductibility is abolished. The difference increases with increasing interest rate, and vice versa.

Of course the conclusion depends on the assumptions. The calculation is simple however, and the outcome is only proportionally sensitive for changes in the assumptions. Because of the margin between 0.01 and 0.006 the conclusion is not very sensitive for small changes in the assumptions.²¹⁸

In the Netherlands, for decades, the deductibility was considered as self-evident and beneficial. But in the financial crisis, when politicians began to feel pressure to reduce budget overruns and government debt, politicians of all parties suddenly began to see all kinds of reasons for its abolishment. Of course without saying that abolishment would increase government income and help reduce deficits (if everything else remained equal or went in the same direction). None of them defended the deductibility!²¹⁹ The arguments were actually nothing new, and it was not explained why deductibility had been introduced at all if there were so many arguments against it. The only thing that had changed substantially in all these years was the government debt. The only credible motive for abolishment of the deductibility is tax increase. Politicians obviously find tax income more important than stability of the law and the welfare of the citizens. The politicians in power, and only they, systematically spent more than available in the treasury. Instead of retracting they seize even more power. Because that is what tax increases mean: more power about what is done and not done in a country.

In 2012 the Dutch market for houses had come to a standstill. This must have been the effect of the crises and the uncertainty about the deductibility of mortgage interest. The new government Rutte II²²⁰ has a plan that was presented as a long term plan. But many people don't believe it will remain as it is, without further changes. In November 2012 the Dutch Central Statistics Office announced that in the last quarter the Netherlands had been in a recession. It mentioned three causes: less export, less consumer spending, and the housing market standstill. In other words: the introduction of the deductibility of mortgage interest some decades ago would have been nice, but only if it could have lasted. Which means: if politics had cut its coat according to its cloth, and would not have forced itself to seek for possibilities for tax increases and new taxes.

²¹⁵ The x in $100xR$ meaning multiplication: $100xR =$ hundred times R.

²¹⁶ For convenience, and in agreement with mathematical custom, $R \times H$ is written RH.

²¹⁷ It is not adjusted yearly to the interest rate for example. (As many other rates are).

²¹⁸ It is stable. Stability refers to small changes however. In reality, the steady drop in interest rates until at least 2016 may have turned the scales: keeping interest deduction may have been more profitable for governments.

²¹⁹ Note that this must have been a covertly concerted action.

²²⁰ The second government of prime minister Mark Rutte.

Abolishing deductibility of mortgage interest in principle means a drastic impoverishment of home owners. However, this impoverishment can only be seen in specialist financial economic statistics. Not or hardly in the general ones which are used as indicators of welfare and the health of the economy. This is a consequence of the primitive state of economics, which is overwhelmingly biased towards income, and hardly looks at capital. The yearly change in GDP plays a dominant role in policy, the change in national economic capital (an unknown term!) none at all.²²¹ If national economic capital would be considered just as important as GDP, then abolishing deductibility of mortgage interest payments would be considered just as acceptable as halving incomes... In other words: it would be unacceptable.²²²

9. Moral obligations.

Summary and conclusions.

1. In so far as they have not been laid down in the law, it is not clear what moral duties people have and why. The more so if these duties are considered insufficiently important to be included in the law. Blaming financial institutions in the narrow sense for unethical behavior is therefore debatable. It ignores the competitive context of these institutions. There are good reasons however for accusing governments and supervisors of immoral conduct. They systematically neglected their legal duties.
2. Consequent liability and criminal law can prevent much of the observed misconduct, and limit negative unjustifiable consequences.
3. If the financial institutions in the narrow sense misbehaved systematically, then either the supervision was inadequate, or the duties and powers of the supervisors and/or other parts of the law. In the first case the supervision of the supervisors by governments and parliaments was insufficient, in the second case governments and parliaments failed to make adequate laws.
4. None of this is discussed by the inquiry commissions.

■ On p. xxii/22 of its report the FCIC majority concludes:

«We conclude there was a systemic breakdown in accountability and ethics.»²²³

The explication shows that in this case “systemic” refers to the financial system in the narrow sense: excluding supervision. What is meant by “accountability and ethics” is not explained. Is it supposed to mean more than laid down in the appropriate regulation? It is entirely unclear. In particular the FCIC nowhere explains why anyone should feel, or be, bound by more than the law.

Forcing mortgages down the throats of people who cannot afford them may be called unethical. But it costs the lender money too. It would cost a lender (much) more if liability and criminal law were more strict and consequent. This is not noted and discussed by the inquiry commissions.

Apart from “lax regulation”, the explication only mentions employees of institutions in the narrow sense. But the report of the FCIC majority, and its other conclusions, show that the “breakdown” is even more evident in supervision and government. If non fulfillment of legal obligations, and promotion of reduction of mortgage requirements without due care for the consequences isn’t proof of unacceptable lack of accountability and ethics, what is?

The FCIC does not explain why financial institutions are bound by more than the law (and law-dependent regulation). The FCIC ignores the fact that many institutions compete with one another. It also ignores the conflict this implies between protection of market share and what the FCIC considers morally desirable (but does not specify). If the extra-legal moral requirements had been found important in 1995-2005 say, why were they not included in law or regulation? In other words: if the FCIC majority really considered compliance with extra-legal moral norms important, then it should have blamed Congress and government for not including them in law or regulation. But it didn’t.

²²¹ This may also be due to a very different, political motive: government (tax) income is directly related to GDP, and only very weakly to capital.

²²² Probably it would not have been introduced in the first place.

²²³ This is its conclusion 6.

It is quite unclear why people or organizations might be expected to observe more (restrictive) norms than included in law or regulation. The more so if “freedom” is considered very important. It is clear however why one may expect more from some organizations than from others. If it is assumed that a person (organization) is bound by the law, and otherwise free, then there is no good reason for expecting him (it) to give priority to extra-legal norms which threaten his (its) welfare. This argument does not apply to public monopoly organizations such as government organizations and supervisors. Their legitimacy depends on proper public accounting, and therefore on behavior which should be responsible in a wider sense than that of the law. In general moreover, they have no competitors.

As noted before, the dilemma of the financial institutions in the narrow sense: extra-legal ethical behavior at the cost of enterprise success, is a variant of the prisoner’s dilemma game. In this case it is solvable by making a binding agreement about the norms to be observed, a provision for supervision of compliance, and fines or other sanctions for infringements. Competent governments understand this. Solution of this kind of problem is one of the main reasons for their existence. As it is, the weakness of liability and criminal law may be a reason for the competing financial institutions not to regulate themselves. It is inefficient. In other words: the fact that the group did not regulate itself can be blamed on inadequate liability and criminal law.

Nothing like this is mentioned by the inquiry commissions.

10. Government and supervision were unprepared for a crisis. Practical circumstances as explanation of inconsequent and arbitrary conduct.

Summary and conclusions.

Supervisors and governments were responsible for the beneficial and safe operation of the financial system, but had no policy and plans for eventualities. In this regard too they did not do their legal duty. Their organizations and human resources may have been adapted exclusively to the normal operation of the system. Adjustment to crisis circumstances costs time, and may require employees with other abilities, and another organization structure.

Because of human deficiencies, care must always be taken in explaining human behavior: there need not be any logic. But for the reasons given here, extra care is necessary when explaining behavior in the crisis. The lack of preparation, the speed of the developments, the pressure of the circumstances and the incompetence of the principal persons can explain that more errors were made in the crisis than in other times, and that allowing Lehman to go bankrupt was just one of them.

■

In its conclusions the FCIC majority asserts:

«[...] the government’s inconsistent handling of major financial institutions during the crisis- the decision to rescue Bear Stearns and then to place Fannie Mae and Freddie Mac into conservatorship, followed by its decision not to save Lehman Brothers and then to save AIG- increased uncertainty and panic in the market.»²²⁴

The reason for letting Lehman go bankrupt that Treasury secretary Paulson gave to the FCIC in his hearing: the lack of a bank willing and able to take over Lehman à la Bear, is incredible both because of the inadequacy of the argument and the seriousness of the potential consequences. The argument is inadequate because it implies that a sufficiently large bank will always be forced into bankruptcy, irrespective of its importance for the financial system. For because of its size (and/or the size of its liabilities) a sufficiently large bank cannot be taken over.

The report of the FCIC majority clearly shows that there was no previously thought out policy, and that there were no plans for eventualities. Not at the Treasury department, and not at the Fed. There is no indication of even the outline of the main features of a policy: a set of basic rules of behavior.

The story of Paulson could very well be due to rationalization by hindsight. Constructed to fit the misleading illusion that every action, certainly of the government, has an understandable reason, or serves understandable interests. As may have been noted in one of the first chapters of this report, this

²²⁴ FCIC p. xxi/21.

kind of rationality is no more than a figment of the imagination, a falsified hypothesis. Perhaps there were good reasons for letting Lehman go bankrupt. But there is no proof of any policy. On the contrary: the available evidence suggests its absence. Nobody mentioned a convincing interest. The opposite is much more probable. Namely that not bankruptcy but rescue was in the interest of the financial system and society.

The number and competencies of the employees of the supervisors and the Treasury were probably adapted to the set of activities in normal circumstances ("peace time"). If not very much preparatory work had been done for dealing with the circumstances of 2007-2008, and especially those of September 2008, in the decade preceding them, then it is evident that the supervisors and Treasury cannot have been adequately prepared. There is no evidence of preparatory work of the kind required. Adequate preparation is extremely improbable because all documents are consistent with the assumption that all principal persons, without exception, were taken by surprise by the events. Which is understandable because the events were incompatible with their (erroneous) dogma's. Even while the crisis was unfolding they seem to have remained optimistic. (As a true believer should). The reactions of the supervisors and Treasury departments clearly were 100% ad hoc.²²⁵

Similar considerations may explain Paulson's proposal of 3 pages of 20/9/08. Especially in September 2008 catastrophic events followed one after the other, or were even simultaneous. In answer to a question of FCIC member Murren for examples of mistakes, Paulson mentions the submission of this proposal. He calls it a communication mistake. It seems much more probable that it was not so much a mistake as one of the many consequences of the pressure of time and inadequate preparation and competencies. (Which obviously may cause communication errors too). Due to the lack of prior preparation, time, competent people, and tiredness, it was simply impossible to come with something better at short notice. (Of course, this is one of the great dangers of bad risk management, belief in stupid dogma's and repression and elimination of critics). Paulson and his collaborators must have thought: matters are completely running out of control, a soothing signal is imperative, and anything is better than nothing.

The proposal of 3 pages is consistent with the assumption of the absence of blueprints and preparation.

11. Lobbying.

Summary and conclusions.

Part of the blame for the reduction of the mortgage requirements, the worsening of law and regulation, and the non-regulation of some classes of risky financial products, goes to lobbies. Even though the government officials who listened to them and acquiesced in their wishes bear a greater responsibility. In any case realization of the goals of these lobbies increased the risk of a crisis.

The suggestion that lobbies have a positive influence by supplying information and expertise, and that politicians know how to deal with them, that is: to correct for bias, has been falsified by the subprime crisis. For the information function the internet offers a transparent alternative.

In its present forms, lobbying and cooperation with lobbying should be prohibited and made a punishable criminal activity. Apart from that, lobbyists should be liable and punishable for the consequences of their activities (and omissions). Like everybody else.

■

At least two lobby groups have contributed to the origin, growth and extent of the subprime crisis: the banking lobby and the CRA lobby, the NCRC.²²⁶ The last can be held co-responsible for

²²⁵ The GPRA- and annual reports of the Fed do give a report of the crisis, including the activities of the Fed, but these activities are not considered in the light of a coherent and substantiated policy framework. For example in the light of a policy aimed at control of systemic risks in case of a significant disturbance. Pp. 53-5/63-5 of the Fed AR 2008 gives arguments for various liquidity provisions, and pp. 55-6/65-6 for buying assets. Pp. 56-8/66-8 gives arguments for supporting Bear Stearns, AIG, Citigroup en BofA (but not for the specific form of the support). The measures and arguments confirm the ad hoc character of the Fed's activities.

²²⁶ As regards the banking lobby: *Inside Job* contains parts of an interview with Scott Talbott, Chief lobbyist of the Financial Services Roundtable.

promotion of the systematic reduction of mortgage requirements. And therefore for the fundamental growth of the risks and poisoning of mortgage backed securities (MBS). The growth is called fundamental because the risks of conventional mortgages were bearable, but those of the new contracts were not. For information about the activities of this lobby see the FCIC minority report of Wallison and both reports of Pinto. Typical for the religious-dogmatic character of the lobby is the introduction of the Acknowledgements of the NCRC report *CRA Commitments* of 2007:

«The National Community Reinvestment Coalition (NCRC) is the nation's trade association for economic justice whose members consist of local community based organizations. Since its inception in 1990, NCRC has spearheaded the economic justice movement. NCRC's mission is to build wealth in traditionally underserved communities and bring low- and moderate-income populations across the country into the financial mainstream.»

Of course it was already known for centuries that supposedly good intentions are not sufficient for good results. But mankind is seen unable to learn, and the subprime crisis is the umpteenth sad example. As a consequence of the blind and unthinking lobbying of the NCRC its intended beneficiaries suffered most. The NCRC realized the opposite of what it intended. It destroyed wealth instead of creating it. Closer examination of the activities of the NCRC is obstructed by the removal of annual reports and the quoted report from its website.²²⁷

The hypothesis that governments and parliaments know how to deal with lobbying, and that lobbying has a (net) positive influence has been falsified by the subprime crisis. The following gives an impression of the banking lobby in the FCIC majority report.²²⁸

«In response [to big losses by speculation/ deficient or incorrect information], the U.S. General Accounting Office [GAO, May 1994] issued a report on financial derivatives that found dangers in the concentration of OTC derivatives activity among 15 major dealers, concluding that “the sudden failure or abrupt withdrawal from trading of any one of these large dealers could cause liquidity problems in the markets and could also pose risks to the others, including federally insured banks and the financial system as a whole.” While Congress then held hearings on the OTC derivatives market, the adoption of regulatory legislation failed amid intense lobbying by the OTC derivatives dealers and opposition by Fed Chairman Greenspan.»²²⁹

Replacement of the Glass-Steagall Act by the Gramm-Leach-Bliley Act (GLBA) in 1999 would enable, or rather legalize,²³⁰ the merger of Travelers with Citibank. To effect this replacement, the financial sector spent some US\$ 190 million on lobbying in Washington. The GLBA allowed a holding to cover various types of financial activities, from insurance to securities trade.²³¹

After²³² the fraud and fall of Enron, «[...] the regulators failed to take timely action. They missed a crucial opportunity. On January 2, 2003, one year after the collapse of Enron, the U.S. Senate Permanent Subcommittee on Investigations called on the Fed, OCC, and SEC “to immediately initiate a one-time, joint review of banks and securities firms participating in complex structured finance products with U.S. public companies to identify those structured finance products, transactions, or practices which facilitate a U.S. company’s use of deceptive accounting in its financial statements or reports.” The subcommittee recommended the agencies issue joint guidance on “acceptable and unacceptable structured finance products, transactions and practices” by June 2003. Four years later, the banking agencies and the SEC issued their “Interagency Statement on Sound Practices Concerning Elevated Risk Complex Structured Finance Activities,” a document that was all of nine pages long.»

Why did the Senate accept this? Because of the deregulation policy, and pressure from financial

²²⁷ As the dossier shows this is the only significant exception of this kind.

²²⁸ It has been tried to find examples which do not, or as little as possible, depend on interviews after the fact.

²²⁹ FCIC p. 47/75.

²³⁰ For the merger had already taken place. For details see also *Inside Job*.

²³¹ FCIC pp. 54-5/82-3.

²³² And before as well!

institutions? The last had severely criticized drafts. «When the regulators issued the final guidance in January 2007, the industry was more supportive. One reason was that mortgage-backed securities and CDOs were specifically excluded. [...] Those exclusions had been added after the regulators received comments on the 2004 draft.»²³³

In 2005 the Fed and other supervisors investigated mortgage practices:

«The study “showed a very rapid increase in the volume of these irresponsible loans, very risky loans”».

Therefore the supervisors wanted to send a “guidance” to the institutions concerned. A “guidance” was considered sufficient. But first they sent a draft:

[The draft-guidance] «warned lenders that low documentation loans should be “used with caution.” Immediately, the industry was up in arms. The American Bankers Association [= a lobby group] said the guidance “overstate[d] the risk of non-traditional mortgages.”»

And more soft-pedaling. Moreover:

«The need for guidance was controversial within the agencies, too. “We got tremendous pushback from the industry as well as Congress as well as, you know, internally,” the Fed’s Siddique told the FCIC. “Because it was stifling innovation, potentially, and it was denying the American dream to many people.”»

«Opposition by the Office of Thrift Supervision [= OTS] helped delay the mortgage guidance for almost a year. [...] Another challenge to regulating the mortgage market was Congress. She [= Fed governor Bies] recalled an occasion when she testified about a proposed rule and “members of Congress [said] that we were going to deny the dream of homeownership to Americans if we put this new stronger standard in place.”»²³⁴

Lobbying contributed to deregulation (“self regulation”), and prevented adequate law and regulation and supervision. The federal government allowed itself to be used by lobbies, even though it could and should have been clear that the wish list of the financial sector lobbyists was contrary to the interests of society at large. And possibly even contrary to the interest of the financial sector itself.²³⁵ The government permitted lobbyists to play a decisive role in important law and regulation making. It seems not to have been in control. It didn’t even play a critical role. Stupidity was trump.

It is sometimes said that lobbyists are no more than experts who inform. If that would be true they could better put their information on a public website on the internet. Or even better: in public forums offering the opportunity for comments and discussion. So that untruths, half truths, and misstatements can be noted.

The idea of lobbying is incompatible with the idea of representative government. Lobbying is detrimental to the way of representation as (supposedly) meant by the constitution and the law.

By making liability and criminal law consequent, lobbyists become liable and punishable for the consequences of their activities.

7B.5. National supervision.

Table of contents of this section.

1. Summary and conclusions.
2. Explanation of the failure of the supervisors- summary.
3. Introduction.
4. The supervisors: evaluation of their annual reports.
5. Supervision in the USA.

²³³ FCIC pp. 204-5/232-3. CDO= collateralized debt obligation.

²³⁴ FCIC pp. 172-3/200-1. Note that with respect to the responsibility of the politicians in power these are very important paragraphs. They show the influence of political goals on supervision irrespective of interference with the primary (if not inviolable?) duties of the supervisors. Siddique implies that similar pressure existed inside the Fed.

²³⁵ Note that lobbyists have a self interest which can be contrary to the interests of those they represent.

6. Supervision in the Netherlands.
7. The conclusions and recommendations of the inquiry commissions with respect to supervision.

1. Summary and conclusions.

1. None of the studied reports describes which financial supervisor does or should do what, and where there are gaps in the supervision. This applies at both the national and international level. Supervisors depend in part on other supervisors, including supervisors in other countries. Annual reports nor other documents provide clarity about the situation.²³⁶
2. The events and annual reports support the hypothesis that the supervisors don't know which supervisor does exactly what, and where there are gaps in the supervision.
3. The supervisors do not show how they supervise. They do not describe what supervision means in practice. Is it (partly, entirely?) based on declarations of the institution under supervision? What does risk based supervision mean? How is adequacy of this method evaluated? What are the limitations of financial supervision, the remaining risks?
4. A description and evaluation of the supervision of the financial system is missing. There is no picture of the way supervisors and financial institutions communicate, and of the agreements they made.
5. In the years 1994-2008 the supervisors systematically drew too optimistic conclusions about the developments in the near future. (They said nothing about the long term). Governments and parliaments accepted their conclusions uncritically. Supervisors, governments, and parliaments could and should have known that the conclusions did not have a sound basis.
6. Supervisors pointed out risks, but played them down. They misled for example by suggesting that "weighing everything" the most probable would happen.²³⁷ Conclusions like that demonstrate an unprofessional and dangerous lack of understanding of the concept of probability, and/or insufficient communication competence.
7. In other respects too, the annual reports of the supervisors leave much to be desired. The insufficient quality of the annual reports is compatible with their failure in the years 1994-2008, and with their conduct during the crisis.
8. The supervisors in the US and Netherlands demonstrate no knowledge and understanding of the system as a system, of the processes, vital elements, and the factors on which the safe and sound operation of the financial system depends in an essential way. The annual reports only pay attention to parts, and not in a systematic way.
9. Nothing shows awareness of instabilities of the financial system.
10. The understanding of the concept "risk" is insufficient. Governments, supervisors and others do not evaluate risks in the light of their size or potential consequences, but only on the basis of their existence, irrespective of the consequences.
11. Governments and supervisors do not know how to deal with risks. The annual reports of the supervisors show that they do not think in terms of possible scenario's. They suggest that they compare possibilities. They claim that a positive course of events is the most probable. Henceforth they ignore every other possibility.
12. There was no risk management whatsoever. No plans were made for any other scenario than the (supposedly) most probable.
13. In their annual reports the supervisors assert that the public can trust them, and that they successfully do what they have to do. That they even set an example. There is no trace of doubt or modesty.
14. After the crisis they denied wrongdoing.
15. In the period under consideration, only the GAO and OFHEO published reports about risks of the financial system that pass muster. In 1994-1999 the GAO published reports about derivatives and systemic risk, and in 2004 a report about GSE regulation. In 2003 OFHEO published a report on

²³⁶ Including those of for example IMF and OECD. As regards the US, the already quoted section *Financial Regulatory Structure* of the GAO report of 1999 comes closest.

²³⁷ An argumentation error also made by John Locke, in *An Essay concerning Human Understanding* IV, XVII,16.

GSEs and systemic risk. The recommendations of these reports were insufficiently (or not) implemented. Neither at the time nor later. They were rejected by the financial supervisors. Partly on the basis of fake-arguments; partly by keeping silent about them.

16. In their annual reports, none of the supervisors has shown knowledge of the GAO and OFHEO reports, and CGFS reports about similar subjects. (Neither has any government official). Only the FCIC mentions the first GAO reports.²³⁸ Former director Falcon of OFHEO mentions OFHEO's systemic risk report in his hearing by the FCIC. The FCIC does not try to find out why the reactions to these reports were inadequate. Even though it is clear that an adequate reaction would have prevented the crisis, and that understanding the reactions is a key to understanding how things can go wrong.²³⁹ The responsible people simply did not do what they could and should have done.²⁴⁰ Without giving a valid reason.
17. If the secretaries of the Treasury and the heads of the supervising organizations would have had the competencies necessary for their jobs, they could and should have drawn the same conclusions as the GAO or OFHEO on the basis of their own independent analysis. There is no evidence that they did.
18. The impression of expertise made by the heads and spokespeople of the supervising organizations (and other principal persons) is incorrect.
19. Although there is much overlap of important duties of many financial supervisors and international organizations like BIS, IMF, and OECD, and advisory bodies like CPB, and although there is even more complementarity, the (annual) reports of these organizations say next to nothing about cooperation and coordination.^{241, 242} They do not refer to one another, and don't discuss each other's analyses and conclusions.
20. The only significant energetic coordinated action by the top financial authorities in the years before the crisis was that of Greenspan, Levitt, Rubin and Summers in 1998-9. It had an obstructive purpose: avoiding regulation of OTC, and the elimination of initiator Born.²⁴³
21. All supervisors and related organizations (BIS, IMF, OECD and the like), made their own analyses of the state and stability of the financial economic system. Without due regard for the work of predecessors and similar organizations. All of them use a technical terminology and appear to be written by experts. They are substandard and unprofessional all the same. The analyses are not even truly useful, because the only thing one can know for certain is that they cannot be reliable. The most essential deficiency being a lack of knowledge and understanding of both the relevant literature and the financial system. As proven by mutual comparison, and by comparison with the oft mentioned GAO, OFHEO, and CGFS reports. Because of their importance and uniqueness, ignorance of these reports is inexcusable. Every analysis that wants to be reliable should take account of the relevant literature, and discuss it appropriately. This is simply what professionalism and reliability mean.
22. If the supervisors had been aware of a great danger, they could and should have issued a joint warning, preferably in collaboration with scientists. They didn't.
23. The supervisors failed (and fail) to warn for budget deficits and excessive government debts.
24. It is an understatement to say that the supervisors failed. They actively misled. They made no honorable and competent efforts to do their duty. They were unacceptably uncritical and complacent. The warnings they gave (if they gave them) were unclear and ambiguous. They misled the outside world by saying that they could be trusted to keep the financial system safe and

²³⁸ Only this caused the author to find them.

²³⁹ The GAO report was submitted to Congress. Congress should have understood that the supervisors and Treasury would not react adequately unless Congress forced them to.

²⁴⁰ The "could" depends on competence. So the "could" is meant metaphorically, assuming they had the abilities necessary to understand the GAO reports, understand their importance, and implement the applicable recommendations. They certainly did not do what they had been taught at school and college etcetera. For the common part of education does show the harmful consequences of dogmatism and repression.

²⁴¹ The President's working group (see below) is not mentioned in the AR 2006 of the Fed, nor in that of the SEC. (Other AR have not been checked for this).

²⁴² In the US, some supervisors were competitors... See the FCIC report.

²⁴³ See the Chronicle, under 1998 and 1999.

- sound. They bragged about themselves. They always gave an optimistic picture of the financial system, hampering the risk management of all actors in the financial system.
25. This applies with minor adaptations to BIS, IMF en OECD.
 26. Notwithstanding claims about the global nature of the financial system and the interdependency of countries, and although it is evident that the safety and soundness of say European banks depends on the safety and soundness of the US financial system, none of the supervisors pays attention to the quality of supervision in (important) other countries.
 27. The IMF had a Financial Sector Assessment Program. Its evaluation of Dutch financial supervision proves that it is inadequate and misleading.²⁴⁴
 28. During the period under consideration, the people with the relevant responsibilities had a fatal lack of self-knowledge, of understanding of the processes and interactions in the financial system and their risks, of openness, and of awareness of their responsibility. Exceptions were the people involved in the GAO reports of 1994-1999 and 2004, and those in the OFHEO systemic risk report of 2003.
 29. There is no accessible information about the influence of annual and other general reports of supervisors on the risk management of the institutions.

2. Explanation of the failure of the supervisors- summary.

The observations about the supervisors can be explained by the following characteristics of the top of these organizations:

1. Essential lack of integrity and competence.
2. False pretensions, arrogance, insufficient skepticism with respect to their own abilities, insufficient willingness to listen to, and to work on the basis of, sound arguments, insufficient doubts about the right to ignore opinions of others, insufficient willingness to account for their actions and omissions. Instead of this: dogmatic and authoritarian thinking and attitude.
3. Lack of understanding of the financial system and of its instability, and of the concept of risk.
4. Inability to reason and communicate about risks and an uncertain future.
5. (Internal and external) repression of opinions and even facts which they don't like. Within the organization difference of opinion is not permitted. Irrespective of the number and quality of the employees.
6. It does what it can to make people think of their organization as a single person, and that the opinions of this person represent the best if not infallible thinking of the aggregate of its hundreds or thousands highly qualified experts.
7. Lack of willingness (and maybe ability) to publish facts, analyses, opinions, recommendations, etcetera which are incompatible with prevailing political or their own thinking, but which their duty requires them to publish.
8. Lack of willingness (and/or ability) to cooperate with similar organizations, and experts outside the financial system.
9. A desire to brag: we supervise excellently, so our institutions are in excellent shape, we can be proud of our job and ourselves, and public and system may rely on us.

And by:

10. Dependency instead of independency of the supervisors. For three reasons:
 - a. Most supervisors are formally independent. But for example the Fed “must work within the framework of the overall objectives of economic and financial policy established by the government”.²⁴⁵ This created a conflict of interest.
 - b. The heads (and boards) are appointed by politicians. To all appearances they select people who, notwithstanding their duties and formal independence, give priority to the wishes of what seem to be seen as friends, colleagues or political superiors.

²⁴⁴ «According to the IMF the supervision of the financial institutions satisfies the international norms very well, and belongs to the best practices in the world.» DNB AR 2004 p. 66/64, quoted in the DNB appendix. If true, this disqualifies the IMF program. See below, and the DNB appendix.

²⁴⁵ Pp. 2-3 of *The Federal Reserve System: Purposes and Functions*, 9th edition, June 2005.

- c. Financial dependencies.
- 11. Repressive signals and/or actions of supposedly authoritative persons or organizations. Especially the president and government officials (including Congress).
- 12. Regulation which is fatally deficient. Supervisors have nothing to fear from not doing their duty.
- 13. Complete lack of supervision of the supervisors by parliaments and governments.

3. Introduction.

The law provides for organizations which have supervisory and regulatory duties with respect to the private, commercial organizations of the financial system.²⁴⁶ The law may require them to specify applicable laws, and/or give more technical regulation.²⁴⁷ They supervise compliance with applicable regulation. They do their job for the benefit of society as a whole, for the general welfare. Together they have to ensure that the system operates as may be expected of it. That is: in a way that is beneficial for everyone. For a specification of the duties of the supervisors the reader is referred to the appendices, the annual reports, or other contemporary pre-crisis documents.

The US has quite a few financial supervisors. They are responsible for overlapping parts of the system, but not for the whole system. They may compete with each other for the favors (customership) of institutions. They will be listed below. The Netherlands has two financial supervisors, DNB and the Authority for the financial markets (AFM). It should not be forgotten that in all countries, the minister of finance (secretary of the Treasury) is the ultimate and most powerful supervisor. Beside the national supervisors there are international organizations which periodically publish about the development of the international and most important national financial economic systems: the Bank of International Settlements (BIS), the European Central Bank (ECB), the International Monetary Fund (IMF), and the Organization for Economic Cooperation and Development (OECD). Twice a year the IMF publishes a specific *Global Financial Stability Report*.

All supervisors yearly publish an annual report.²⁴⁸ As the name indicates, an annual report should describe the activities in the year under consideration, and the results obtained. It should give a picture of the state of affairs of the part of the system for which a supervisor is responsible. Including problems and risks. In the annual report supervisors can account for their policy and activities. They can use the annual report as an instrument for the fulfillment of their duties.

As from about the year 2000 the annual reports of the supervisors are available as pdf-files on their websites. Beside the annual reports most supervisors publish reports about specific topics. In the framework of this study the most important of these reports are the stability reports of BIS, BoE (Bank of England), DNB, ECB, and IMF. In agreement with their (ill-founded) belief in self-regulation, stability reports were not published by US supervisors.

There has been a lot of discussion about the adequacy of the powers given to the supervisors. Whatever the merits of such a discussion, there can be no doubt about the duty and possibility of the supervisors to report problems by means of their annual reports, and to do this timely and completely. And to submit all requests and/or recommendations which they deem necessary for the proper fulfillment of their duty.

Supervisors are hierarchical organizations. They were instituted by law, and the law prescribes how their heads are appointed. In general they are appointed by a secretary (minister) or the president (with the approval of parliament). Often they are subordinate to this person in one way or another, or perceive subordination. If only because they depend on them for (part of) their budget. In general supervisors do not operate fully on their own. In general they confer periodically with their paymaster. As regards the financing of the supervisors the US is exceptional. In general US supervisors are not paid by taxpayers. Some are paid by the institutions supervised.²⁴⁹ However, this doesn't make the supervisors independent from the federal government.

The remainder of the section discusses the operation of the supervisors with respect to the crisis.

²⁴⁶ I.e. the financial system in the narrow sense. Together with rating agencies and supervisors, the private commercial organizations form the financial system in the wide sense.

²⁴⁷ For this reason they are sometimes called regulator.

²⁴⁸ In principle. OTS didn't. See the introduction to its AR 2007, of the OTS appendix..

²⁴⁹ For the Fed see p. 11 of the Fed brochure Purposes and Functions (2005).

The Chronicle showed that supervision failed disastrously. But it also failed with respect to problems (“accidents”) unrelated to the processes which resulted in the crises. Problems which also would have occurred if there had been no crisis. Examples are: DSB (an upstart Dutch bank), Icesave, and the Ponzi-scheme of Madoff (and the large scale participation in the scheme by many banks everywhere). The similarity with the crises is, that all these problems were caused by taking unbearable risks. And by inadequate supervision. Adequate (“unpolitical”) supervision would have prevented all of them, including the damage they have caused.

4. Supervision: evaluation of the annual reports.

Summary and conclusions.

1. The annual reports of all supervisors ignore the GAO reports of 1994-1999, the systemic risk report of OFHEO,²⁵⁰ and the risks that motivated Born. (At least in any practical sense). The annual reports are systematically rose-colored. Everybody understanding the events of 1994-1999 only a little could have concluded that the annual reports are unreliable, and that large risks were not addressed by supervisors or governments.
2. From the unchanging style of the reports²⁵¹ it is clear that effective supervision of the supervisors was absent.
3. In a technical sense as well the annual reports leave much to be desired. That is: as reports of the policy and activities in the given year, also in the light of the policy and activities in the preceding years.

Besides the facts of the crisis, nothing shows the dysfunctioning of the supervisors as clearly and indisputably as their annual reports. Especially those of 2006-2008. A better proof of the false pretensions of the supervisors than these annual reports is hardly imaginable. In the light of the crises the reports show a combination of nonsense and complacency which seems surrealistic. The reports almost always suggest that everything is under control and runs smoothly. Some reports proudly show the prizes won with the previous edition of the annual report.

Amazing is the fact that there are very few exceptions. Apart from the GAO reports of 1994-1999 and 2004, the OFHEO systemic risk report of 2003, and with the (early) exception of Born, there were no reliable voices in the financial wilderness. The OFHEO systemic risk report was itself an exception, given a series of misleading annual reports. Whatever people like Strauss Kahn (IMF) and Wellink (DNB) asserted before inquiry commissions.²⁵²

The annual reports of the supervisors are exceptionally important because of the information they give about the functioning of the supervision, and because they are not affected by hindsight. For a report like this they are extra welcome because they are accessible for everyone. You can easily check everything for yourself. For the benefit of this book, annual reports of all of the supervisors mentioned have been studied and evaluated. The evaluations are fairly extensive. Therefore only their summaries and conclusions and a few quotes are presented in the main text. The evaluations can be found in the appendices. The annual reports themselves can be found in the dossier.

The GAO report of 1994 explains why the supervisors couldn’t have a reliable picture of the robustness of the financial system. See for example the section *Regulators Are Not Collecting Sufficient Information on Credit Risk and Earnings* on pp. 70-1/72-3 of this report. Supervisors could and should have known. If they hadn’t read or heard, they should have been able to infer it themselves, and been aware of it. Without such (and other) information, they never should have asserted that the

²⁵⁰ Even OFHEO itself ignored it! The report was probably made by a relatively small unit. Upon completion and publication, everybody else will have congratulated them, but continued his or her own work as before. Without active management work in an organization does not change fundamentally. The same was seen in the Dutch education ministry.

²⁵¹ And the absence of annual reports of the Office of Thrift Supervision (OTS) up to and including 2006!

²⁵² Both claim to have warned always and everyone. Regrettably their warnings left no trace in their annual reports or anywhere else. For Dominique Strauss Kahn (DSK) see *Inside Job*. For Wellink see the appendix Wellink.

system was healthy and that the financial institutions worked well. They couldn't know. And they didn't.

The motivation for the rose-colored picture presented by the annual reports may be the same as that of political organizations in general. They want to "prove" that they work well by creating the illusion that the system for which they are responsible works well. Failure and criticism of "their" institutions means failure and criticism of themselves as the responsible supervisors. Experience tells us that the positive picture is often incorrect. The absence of modesty and doubt in the annual reports is misleading and imprudent. It is an affront to the reader, who is supposed to believe unrealistic stories. Prudence is only discernible in some clever diplomatic formulations.

In general, parliaments, governments, and media seem have accepted the annual reports. Their comments can only have been marginal. No substantial improvements can be observed.

The annual reports were not only inadequate as regards content, but also as regards technical aspects. Of important unfinished business the next annual report may say nothing, without any explanation. For an example see the appendix about DNB. The selection of subjects treated seems arbitrary. See the appendix on DNB, and compare with the reports of other supervisors, and/or the international organizations mentioned above.

In the annual reports 2008 of most supervisors one can see what should have been reported in the annual reports of 2007 or earlier years, but wasn't. A clear and rather shocking example is the SEC.

In most of the annual reports a list of important actions and publications is missing. This is one of the things every contemporary could have noted. Including parliaments, governments, and media. Parliaments and governments could and should have done something about it. They didn't. So in this respect too the accounting by means of the annual report was superficial. And another form of accounting doesn't exist. The lists, and the accessibility of the publications, are important because the supervisors have thousands of employees, and because the financial system is very large. It produces a significant part of the national income. Ordering supervision-relevant information about the system is therefore very important. The annual reports could function as a guide to other publications. If you know what to look for you can often find them on a website. But the organization of publications on the websites of supervisors- the browsability- often leaves much to be desired, and seems to be an as yet unsolved problem.

None of the annual reports of any of the supervisors contains a section or chapter with a discussion of activities, policies and/or recommendations of sister-supervisors or relevant international organizations like BIS, IMF and OECD. Cooperative activities get little or no attention.

Explanation of the nature of the annual reports.

The following is meant to explain the misleading annual reports, and to inform. It gives a picture of the making of annual reports, and of the wall employees run up against when they try to make annual reports of their organization more useful and reliable. The picture is based on the personal experience of the author in the ministry of education, the factual annual reports mentioned in this report, and common sense.

Before continuing it may be useful to remark that not only the annual reports of the supervisors of the financial system were/are too rose-colored. The same can be said of the annual reports of the Dutch education supervisor, and its colleague for health care. One cannot escape the conjecture that the causes and mechanisms are general.

Usually draft annual reports are composed by a staff department on the basis of contributions of the various departments of the organization. Where the contributions are annual reports of the various departments. In principle everything is done as in the preceding year. Boundary conditions seem to be: 1) the annual report should not give rise to difficult or unpleasant comments or questions, and 2) it should show or suggest as much as possible that the organization performed excellently, and even better than the preceding year. Where necessary the staff department edits the contributions. In principle in consultation with the department concerned. In addition the staff department writes a draft introduction or something similar, and a draft side letter to be signed by the head of the organization.

Annual reports are public. Employees can read the annual reports of their own organization and those of other relevant organizations. In the case of the financial system in the years before the crisis,

the employees could have seen that the annual reports did not give a reliable picture.²⁵³ Just like the appendices they could have seen the misleading complacency and the gross underestimation or burking of risks. And the experts should have.²⁵⁴ If they had already been working in this organization for a number of years, they could know that the annual reports were always like this. And that government, parliament and media accepted them without comment. If someone would nevertheless venture text amendments which though justified would attract attention and give rise to questions, then it is extremely improbable that his manager would approve them, and pass them on to his superior. In a hierarchical organization even the remark that something is unusual passes for an (weighty) argument. An annual report is mandatory. An organization with power sees it as a necessary but irrelevant ritual. It makes something that resembles an annual report because it has to, but it need not give a truthful picture of the (most important) policies and activities, and of the environment of the organization. Nobody feels responsible for the content, and everybody knows for sure that he or she will be held responsible for commotion caused by changes in style or content, and even more if this gives rise to serious comments or questions.

With regard to the annual report there is a very strict risk management.

5. Financial supervision in the USA.

Summary and conclusions.

1. The heads of the supervising organizations are appointed by the senate in agreement with, and on proposal of, the president.
2. In their annual reports, none of the supervisors gives an overview of the operation of the financial system. That is: of the different types of financial products, the roles they play in which processes, relations between products and processes, and risks, especially of devaluations/ downgrades and their sequel. By implication there was (and is) no overview and analysis of systemic weak points.
3. In their annual reports, none of the supervisors gives an overview of the organization and operation of the supervision of the financial system. None of them gives a clear picture of his responsibilities,²⁵⁵ and of the relation between these responsibilities and those of other supervisors and/or the government. They don't inform about the gaps in supervision: what is and what is not supervised, and what information is needed for what, but missing. They give no picture of what they cannot do or are not permitted to do in order to be able to guarantee that the institutions they are required to supervise are safe and sound, or to what extent, and what that means.
4. The annual reports of the supervisors did not inform about (general) risks threatening the safe and sound operation of the institutions under their supervision. At the same time, they did not say that they had insufficient information or authority to do their work properly.²⁵⁶
5. The supervisors ignored the recommendations of the GAO of 1994-1999. The reports of the GAO and the OFHEO systemic risk report show that even on the basis of a relatively simple analysis important conclusions can be drawn about systemic risks. The facts show that no other supervisor was able or willing to make such an analysis. None (including OFHEO!) acted in accordance with their conclusions.

²⁵³ Those for Dutch education and health care don't give a truthful picture either. Where the insufficiency of education does not refer to the deficiencies noted in 7B.2 above, but to the norms of the given education system. Symptomatic is the observation that the systematic fraud in higher professional education (the "HBO-fraude"), and the problems of the institutions InHolland and Amarantis for higher professional education were not revealed by the supervisor, but by whistleblowers, students and other people. As in the case of the financial supervisors, there was no investigation of the failure of the supervisor. The responsible employees of the supervisor kept their position.

²⁵⁴ This applies mutatis mutandis to the yearly Education reports (Onderwijsverslagen) of the education supervisor. As proven by various scandals in the period considered in this report.

²⁵⁵ The Fed indicates its four main responsibilities, but does not for example explain how these responsibilities relate to the responsibilities of other supervisors, and what activities of what kind of banks it supervises in which way.

²⁵⁶ In its AR, OFHEO, supervisor of Fannie and Freddie, did ask for more powers, but did not explain why.

6. In fact, they seem to have done nothing at all with the aforementioned reports, even though they grew in relevance and importance as time progressed.
7. The supervisors nevertheless do as if they are excellent. They show no doubt about their ability to guarantee a safe and sound financial system.
8. In the years under review, all supervisor annual reports are reassuring, and therefore misleading. The reports gave their readership, including financial institutions, an erroneous picture of the safety and soundness of the US financial system and its products.
9. The Fed and OFHEO had to take government policy into account. It is plausible but not clear that this also applies to other the supervisors. And even if there is no formal obligation, they may have felt an informal obligation. It is clear that in the years 1995-2007 deregulation was the fashion, and that this affected supervision. Conflicts or compromises between supervision and policy cannot explain the dysfunctioning and failure of supervision, but it may have contributed.
10. Perhaps the most blatant example of neglect of duty is the fact that the Fed simply paid no attention to one of its four main responsibilities: «maintaining the stability of the financial system and containing systemic risk that may arise in financial markets». ²⁵⁷ In the Fed's annual report no activity in this field is reported. Indeed, none of the facts of the crisis is incompatible with the hypothesis of complete neglect.
11. The supervision of the supervisors is a duty of government and Congress. They could and should have concluded the above when the annual reports were published. They could and should have taken corrective action.
12. The annual reports of the years after the crisis show no trace of acknowledgement of errors or failure. They don't report about self evaluations (assuming they were made).
13. The combination of facts and annual reports shows that the supervisors, government and Congress were insufficiently competent and honorable.
14. None of this is studied by the inquiry commissions.

The organization of financial supervision in the USA.

The federal system of supervision is regulated by the federal government. The states have supervisors too. The pre-emption conflict noted by the FCIC might be a reason for some description and analysis, but in the present context this does not seem to have much added value (even though it may be important). ²⁵⁸ The discussion in this report is restricted to federal supervisors.

The most important financial supervisors in the US are:

- The Federal Reserve Bank (the Fed)
- The Securities Exchange Commission (SEC)
- The Commodity Futures Trading Commission (CFTC)
- The Office of Thrift Supervision (OTS)
- The Office of the Comptroller of the Currency (OCC).

The GSEs were supervised by the Office of Federal Housing Enterprise Oversight, OFHEO, and, since GSE securities were traded in exchange markets, by the SEC. OFHEO was part of HUD.

There is an appendix on each of these supervisors. The appendices provide basic information and an evaluation.

From the point of view of organization, the system of supervisors of the US seems rather complicated and opaque. From the point of view of duties (“responsibilities”) and activities it gives rise to many questions. For these reasons it would have been very useful if in the introduction or an appendix of their annual reports the supervisors had given an overview of the supervision system and their own role in that system. This would also have given an opportunity to point out gaps in the system. Both as clarification and to avoid illusions. But none of the supervisors or the PWG (see below) did so.

For understanding the operation of the supervision system the following section from the GAO

²⁵⁷ P. 5 of the pdf-file of Fed AR 2006.

²⁵⁸ See the FCIC-report, p. xxiii. Search for example for “state regulat”. The pre-emption is an example of (ab)use of power by the central supervisors to overrule more prudent state supervisors and regulation.

report *LTCM: Regulators Need to Focus Greater Attention on Systemic Risk*²⁵⁹ is very valuable:

«Financial Regulatory Structure.

Hedge funds are generally not subject to direct federal regulation, instead they are indirectly “regulated” by the banks and securities and futures firms that are their creditors and counterparties. The regulators’ role is to ensure that those banks and securities and futures firms are practicing prudent risk management, including the risks they take in dealing with hedge funds. A primary mission of bank regulators is to promote the safety and soundness of the banking system, and this is achieved primarily through ensuring the safety and soundness of individual institutions. Three federal bank regulators oversee banks, some of which are also subject to state regulatory oversight. Bank regulators have the authority to establish capital requirements, establish information-reporting requirements, conduct periodic examinations, and take enforcement actions. The Federal Reserve, the lender of last resort for banks and other financial institutions, also has an additional objective of ensuring the overall stability of the U.S. financial system.

SEC’s and CFTC’s primary purposes are to protect investors or customers in the public securities and futures markets and to maintain fair and orderly markets. Unlike the bank regulators, which can regulate all bank activities, SEC and CFTC are authorized to regulate only activities involving securities and futures and only those entities that trade these products. SEC regulates activities involving securities and the firms that trade these products. Such firms include broker-dealers, which must register with SEC and comply with its requirements, including capital requirements. Broker-dealers must also comply with the requirements of various self-regulatory organizations (SROs) of which they are members, such as the New York Stock Exchange (NYSE) and National Association of Securities Dealers (NASD). CFTC regulates activities involving FCMs,²⁶⁰ which must also comply with rules imposed by futures SROs²⁶¹ - the various futures exchanges, such as the Chicago Board of Trade and Chicago Mercantile Exchange, and an industry association, the National Futures Association (NFA). SEC and CFTC have the authority to establish capital standards and information reporting requirements, conduct examinations, and take enforcement actions against registered broker-dealers and FCMs, but generally not their unregulated affiliates.

The U.S. financial regulatory system has evolved over time, in part in response to financial crises. For example, SEC and the Federal Deposit Insurance Corporation (FDIC) were created during the depression to fill perceived gaps in the regulatory structure. In the 1980s and 1990s, crises and disruptions in markets have revealed additional regulatory gaps. Many of these gaps have been filled by extensions of authority rather than by the creation of new agencies. For example in 1990 and 1992, in response to the Drexel bankruptcy, Congress provided SEC and CFTC, respectively, with authority to obtain information from certain broker-dealer and FCM affiliates. However, SEC and CFTC still lack consolidated regulatory authority over securities and futures firms.»²⁶²

Theoretically the supervision is coordinated by the President's Working Group on Financial Markets (PWG):

«In 1988 Executive Order 12631 established the President's Working Group on Financial Markets. The Working Group is chaired by the Secretary of the Treasury and includes the Chairman of the SEC, the Chairman of the Federal Reserve and the Chairman of the Commodity Futures Trading Commission. The goal of the Working Group is to enhance the integrity, efficiency, orderliness and competitiveness of the financial markets while maintaining investor confidence.»²⁶³

“Theoretically” because the supervision system is far too large to be coordinated in this way. The author does not know how the PWG worked in practice, but it could have worked as an umbrella for a more realistic coordination structure. However, in the years before the crises there clearly was insufficient constructive coordination. There was effective coordination for the elimination of Born and, one may conjecture, for the appointment of kindred spirits in the case of vacancies in the top of a

²⁵⁹ Of 1999, in the dossier.

²⁶⁰ FCM= futures commission merchant.

²⁶³ Wikipedia-lemma “U.S. Securities and Exchange Commission” 23/7/12.

supervisor.

To a certain extent, financial institutions were free to choose their supervisor. As a consequence, some supervisors had to compete with other supervisors:

«Richard Spillenkothen, the Fed's director of Banking Supervision and Regulation from 1991 to 2006, discussed banking supervision in a memorandum submitted to the FCIC: "Supervisors understood that forceful and proactive supervision, especially early intervention before management weaknesses were reflected in poor financial performance, might be viewed as

- i) overly-intrusive, burdensome, and heavy-handed,
- ii) an undesirable constraint on credit availability, or
- iii) inconsistent with the Fed's public posture."

To create checks and balances and keep any agency from becoming arbitrary or inflexible, senior policy makers pushed to keep multiple regulators. In 1994, Greenspan testified against proposals to consolidate bank regulation: "The current structure provides banks with a method... of shifting their regulator, an effective test that provides a limit on the arbitrary position or excessively rigid posture of any one regulator. The pressure of a potential loss of institutions has inhibited excessive regulation and acted as a countervailing force to the bias of a regulatory agency to overregulate."²⁶⁴ Further, some regulators, including the OTS and Office of the Comptroller of the Currency (OCC), were funded largely by assessments from the institutions they regulated. As a result, the larger the number of institutions that chose these regulators, the greater their budget.»²⁶⁵

An important institution in the world of supervision in a wider sense is the General Accounting Office (GAO). The Wikipedia describes this organization as follows:

«The GAO was established as the General Accounting Office by the Budget and Accounting Act of 1921. This Act required the head of GAO to "investigate, at the seat of government or elsewhere, all matters relating to the receipt, disbursement, and application of public funds, and shall make to the President ... and to Congress ... reports [and] recommendations looking to greater economy or efficiency in public expenditures". According to GAO's current mission statement, the agency exists to support the Congress in meeting its constitutional responsibilities and to help improve the performance and ensure the accountability of the federal government for the benefit of the American people.

The name was changed in 2004 by the GAO Human Capital Reform Act to better reflect the mission of the office. While most other countries have government entities similar to the GAO, their focus is primarily on conducting financial audits. The GAO's auditors conduct not only financial audits, but also engage in a wide assortment of performance audits.»²⁶⁶

Supervision in action.

The appendices give general information, and evaluations of annual reports, of Fed, SEC, CFTC, OCC, OTS en OFHEO. At the beginning of each of these appendices is a section *Summary and conclusions*. What follows below are impressions. For a more systematic and informative treatment the reader is referred to the appendices.

OTS deviates from the other supervisors in not having published an annual report for many years. The annual report about 2007, dated 19/12/07, is the oldest the author could find on the internet. The appendix OTS gives general information about OTS and an evaluation of the annual reports 2007 and 2008. The annual reports show that lots of things escaped the attention of OTS, or that it lacked integrity, or both. Section 19.3 of the FCIC majority report describes the result. The section is an uninterrupted sequence of scandals. An example:

²⁶⁴ This may not only prevent *excessive* regulation. For how is the *sufficiency* of the regulation/ supervision ensured?

²⁶⁵ FCIC p. 54/82. (Lay out changed slightly). See also the hearing of Geithner by the FCIC on 6/5/10. Search for "choose the regulator".

²⁶⁶ Wikipedia 7/8/12.

«In February 2008, AIG reported billions of dollars in losses and material weaknesses in the way it valued credit default swap [CDS] positions. Yet the OTS did not initiate an in-depth review of the credit default swaps until September 2008.»

By way of an explanation, director of OTS «Reich told the FCIC that before 2008, AIG had not been a great concern. He also acknowledged that the OTS had never fully understood the Financial Products unit, and thus couldn't regulate it. “At the simplest level, . . . an organization like OTS cannot supervise AIG, GE, Merrill Lynch, and entities that have worldwide offices. . . . I would be the first to say that for an organization like OTS to pretend that it has total responsibility over AIG and all of its subsidiaries . . . it’s like a gnat on an elephant- there’s no way.” Reich said that for the OTS to think it could regulate AIG was “totally impractical and unrealistic. . . . I think we thought we could grow into that responsibility. . . . But I think that was sort of pie in the sky dreaming.”

[President of the NY Fed] Geithner agreed, and told Reich so bluntly. Reich told the FCIC about a phone call from Geithner after the rescue. “About all I can remember is the foul language that I heard on the other end of the line,” Reich said. He recalled Geithner telling him. “‘You guys have handed me a bag of sh*t.’ I just listened.”»²⁶⁷

In March 2008 Reich was still saying that «the Savings and Loan industry remained vibrant due to the effectiveness of regulators». ²⁶⁸ This clearly was a false pretension and misleading. OTS was responsible for significant parts of AIG, IndyMac and WaMu. If Reich really thought OTS couldn't vouch for the safety and soundness of such institutions, he should and could have reported that a long time ago. That OTS couldn't handle them, and/or shut its eyes, also follows from an inquiry of the Treasury department:

«On 26 February 2009, the Treasury Department's inspector general released a report citing laxity at the OTS under Reich for adding significantly to the \$10.7 billion in FDIC losses from the IndyMac failure, as well as the estimated \$270 million in losses suffered by uninsured depositors. The report concluded that, under the law, OTS should have taken Prompt Corrective Action against IndyMac in May 2008. Commenting on the report, Inspector General Eric Thorson dismissed Reich's claim that Senator Schumer's letters caused the failure. Marla Freedman, the assistant inspector general for audit, detailed a pattern of excess risk-taking and abuse of the lending process at IndyMac and the OTS's consistent and concurrent failure to act. Mr. Reich said in a letter to the inspector general that he agreed with the agency's filings.»²⁶⁹

The report of the Treasury department and the comment of Freedman prove that supervision of supervision is possible.²⁷⁰

Reich had been appointed by president George W. Bush. Earlier in his career president Bill Clinton had appointed him Director of the FDIC.

In the meantime Geithner had a record amount of butter on his head. At the beginning of his “Message from the Director” in OTS AR 2007 Reich writes:

«This Annual Report is the first such report from the Office of Thrift Supervision in many years, just one of several “firsts” since I came on board as OTS Director in August 2005.»²⁷¹

In other words: for many years there had not been an annual report. Everybody could have noticed. Why did nobody do anything about it? Geithner was President of the Federal Reserve Bank of New York since 17/11/03.²⁷² How is it possible that he, nor the (federal) Fed, Congress or government reacted effectively?²⁷³ Isn't publication of an annual report a minimal requirement for any responsible organization? From many events in 1994-2006 it should have been known that the supervisory system has risky weaknesses. Therefore every expert should have interpreted the absence of an annual report

²⁶⁷ FCIC report p. 351/79. Note that Reich acknowledges the false pretensions of OTS and himself.

²⁶⁸ Wikipedia OTS, referring to the NYT of 22/11/09.

²⁶⁹ Wikipedia OTS 7/2/13.

²⁷⁰ Of course the appendices prove the same.

²⁷¹ OTS AR 2007 p. 3. In the dossier. AR= annual report.

²⁷² And until 26/1/09, see the Wiki page “Geithner”.

²⁷³ Or sooner. The appointment of a new head may have been intended or sold as a corrective measure.

as a symptom of even more serious problems. Apparently Geithner didn't notice, or didn't see a need for action. He has no reason to be surprised when the risks he took materialized.

The most important conclusion of the OTS experience is probably that history repeats itself. For OTS has failed in the same way as its predecessor. OTS was intended to prevent repetition. But as the OTS appendix shows: contrary to what often is suggested or asserted, politicians and political organizations do not learn.

Even if the head or "the organization" him- or itself did not believe in the risks described by the GAO and almost a decade later by OFHEO and BIS-CGFS, then because of their duty they still should acknowledge the possible existence of a risk, and manage it professionally. If only to be able to account properly for their conduct. Because of the opinions of GAO, OFHEO and BIS-CGFS the risk should have been considered real. Perhaps small, but at any rate greater than zero. The apparently small risk was nevertheless very important because it corresponded with extremely large negative consequences. There was more than enough reason to seriously think about preventive measures, and to make plans for halting the avalanche that was on the horizon in the LTCM crisis, and outlined in the GAO and OFHEO reports. Ignoring the risk would only have been permissible if the top managements had been justified in pretending infallibility. Which of course they weren't. As earlier cases show, these people simply don't accept any views but their own.²⁷⁴ Other views are not taken into account only a little, but not at all. And since they are heads of hierarchical organizations, everyone has to comply, or leave. Heads have no need for risk management or learning.

6. Financial supervision in the Netherlands.

Summary and conclusion.

1. The Netherlands has two financial supervisors. Their duties are not very well defined, but together seem to cover all important aspects.
2. What has been said regarding the operation of supervision in the US applies mutatis mutandis to Dutch supervision. There is no fundamental difference whatsoever.
3. Dutch supervision did worse than US supervision in that a much larger part of the banking system was threatened by bankruptcy and needed government help. In fact, almost all of the larger banks had to be taken over by the government.

De Nederlandsche Bank (DNB), the Dutch central bank.

The appendix DNB gives some general information about DNB, and an analysis of some annual reports and Reviews Financial Stability. The last is published since 2004. Since 2007 twice a year, in May and November.

There is also an appendix devoted to Nout Wellink, the president (= chairman, boss) of DNB in the period under consideration. It includes his CV and an analysis of his hearings by the Commission De Wit (CDW). Both appendices have sections with conclusions. It should be noted that especially by means of his role in BIS, Wellink played, or could have played, an important role in the international financial system.

The failure of DNB defies imagination. The size of the failure can be measured by the amount of taxpayers money that was needed to save the Dutch financial system from total collapse and annihilation, and by the relative size of the part of the financial system that was fatally affected by the crisis. Two of the four largest banks had to be taken over by the government. Other banks had to be saved by loans and other forms of support. All this was avoidable. The best sources of information for the history of these events are the reports of the CDW. These reports do not however describe the

²⁷⁴ A sure sign of incompetence, if not outright stupidity.

problems with SNS, LIBOR and Euribor, which erupted a little bit later, in 2013.²⁷⁵ These later problems not only show the failure of the supervision by DNB. They also show that DNB, government and parliament have not learnt the lessons of the crises, and took insufficient corrective action.

The annual reports, the hearings of the inquiry commissions and many other documents show that after the crisis almost all principal persons systematically tried to represent the course of historical events in such a way as to exculpate themselves, as far as possible without incriminating their peers. History is falsified where deemed necessary. With regard to DNB the hearings of Wellink by the CDW provide numerous examples. See the Wellink appendix and the Dutch report *Wellinks meineed*. Three important and inconsistent lies are that Wellink and DNB had always given warnings, that nobody had foreseen the possibility of a crisis, and that our inability to forecast is to blame.

Annual reports actively contribute to the falsification of history. On p. 120/121 of DNB AR 2007 one reads for example:

«The market turbulence of 2007 has shown that the OTD model has serious shortcomings as well.»

OTD means: “originate to distribute”. A bank can sell mortgages as an investment for itself, but can also sell them, or bundle them in mortgage backed securities (MBS). In the last case the originating bank has a much smaller interest in the quality and performance of the mortgages. For buyers of the MBS this means an additional risk. The quoted remark of DNB is misleading if not incorrect. It is incorrect in suggesting that the events of 2007 and 2008 taught something that was not known before. It had been known for many years already that the OTD model has serious shortcomings. In 2003 at the latest. See section V.1 on p. 16/20 of the BIS-CGFS report of that year. A report that was written in collaboration with employees of DNB! There was no need of a crisis to bring the problem to light. So if this isn’t intentional fraud, then at least internal competence and communication, organizational memory and management of DNB were insufficient.

There are many similarities between the supervisors in the US and in the Netherlands and other countries. But there is an important difference as well. Namely the difference in size. As a consequence, the relation is asymmetric. Cooperative events in the US affect events in other countries strongly, and much stronger than conversely. For this reason other countries have a great interest in a properly operating supervisory system in the US. Inadequate regulation and dysfunctioning supervision in the US constitute a threat to the financial stability everywhere on earth. This is theoretically evident, and has been verified empirically many times since the crisis of 1929 at the latest. Supervisors in the Netherlands and other countries should have understood this. They should have been acquainted with the state of supervision in the US and other financially important states. They should have been aware of threats from other countries. When investigating banks (in their own country), supervisors should have noted that banks held American securities such as MBS, CDO and CDS. They should have concluded that the safety and soundness of their banks depends on the quality of the supervision in the US.²⁷⁶ They should have reported questions or problems in their annual reports, and given a warning about the (extra) risks due to lack of reliable knowledge. But they didn’t.

Perhaps Wellink and his colleagues thought that they should not endanger friendly relations with the US by being (“too”) critical. Supposing they didn’t believe blindly, or thought that they had to assume proper (ideal?)²⁷⁷ supervision. There is no indication of awareness of the dependency, and of the risks of inadequate supervision. Note that the care of friendly relations is an example of improper priorities interfering with supervisory requirements.

The Autoriteit Financiële Markten (AFM), the Authority Financial Markets.

The AFM seems to have had little to do with the crises. The author has heard or seen nothing that

²⁷⁵ Both cases are well documented microcosms. The DNB/Rabobank involvement in LIBOR and Euribor is discussed in chapter 8. For SNS there are some files in the dossier at least outlining the case, but maybe they are not sufficiently complete. Studying this case does not seem to have added value however.

²⁷⁶ Supervisors cannot hide behind the “adequate risk management” of their banks, for how could their banks know the risks of American securities? (Of course, the events have amply shown that the risk management was not adequate).

²⁷⁷ Whatever that may be...

suggested that AFM could be an exception in the world of supervision. For these reasons a study of the AFM seemed to have little or no added value, and has been omitted.

As a check some annual reports have been scanned all the same. In the report about 2006 some remarkable “snapshots” were found. They succinctly characterize the thinking of the times. Since they reveal the political spirit of the times more clearly than anything else in this book (or anywhere), and are almost funny for their shameless shortsightedness and stupidity, they (or equivalent quotes) should be included in any report endeavoring to describe and explain the prehistory of the subprime crisis. The snapshots are found on the pages where prominent people in the Dutch financial or economical world give some AFM-relevant opinions. The following two quotes are typical proofs of a climate facilitating the development and growth of the building blocks of a crisis.

The first quote is of Boele Staal, chairman of the Dutch Bank Association:^{278, 279}

«One should prevent that in the century of supervision all those authorities, including the AFM, only fire freely from an isolated position at the institutions under supervision which otherwise may do what they like. This does not serve the ultimate goal of supervision. Likewise generalizing conclusions should certainly not be based on suspicions or random samples. Carefulness should have priority. This applies to the financial sector itself, but also to the way the sector is dealt with.»²⁸⁰

Both “all those authorities” and “fire freely” are examples of tendentious nonsense. “In the century of supervision” more than half of the larger Dutch banks will have to be taken over by the government: AAB, DSB, ING en SNS Reaal... Due to inadequate supervision.

The second quote is of Bernard Wientjes, chairman of the Dutch Employers Association:^{281, 282}

«In the last decades and in many areas the Netherlands has become a society where almost everything is supervised. Government and parliament moreover prefer supervision beforehand, by a system of licences. In my view wrongly. In the Netherlands we have more than thousand systems of licences with millions of licences! That is a very bad situation for enterprise. Enterprise needs freedom.²⁸³ Where it is thought that we can endeavor to realize a society without risk, this is impossible in practice. Don't misunderstand me. VNO-NCW does not object against all rules. We say: 'Prescribe clear rules, and evaluate afterwards'. In this way you show trust in entrepreneurs. Let them know precisely what they should comply with. But settle accounts sternly if they don't stick to the rules. More trust beforehand, and tougher punishment in case of infringements, that should be the principle.'»²⁸⁴

It is downright nonsense that almost everything in the Netherlands is supervised. The facts have shown that there was not enough supervision. And that there was too much freedom. It is obvious that Wientjes never understood the prisoner's dilemma game. (Supposing he has heard of it). After the crisis, the take overs, and the state-loans, no punishment was meted out at all, let alone sternly. Nobody has ever heard of a request by Wientjes to punish for non-compliance. Nobody remembered the quoted nonsense during or after the crisis. Wientjes remained chairman of VNO-NCW as if he had never tried to subvert supervision. Only in 2014 did he relinquish the chairmanship of VNO-NCW, and only because his term was completed.

Note that by means of such statements Staal and Wientjes are actually lobbying for deregulation

²⁷⁸ Dutch Bank Association. In Dutch: Nederlandse Vereniging van Banken (NVB).

²⁷⁹ In 2016 Boele Staal was appointed acting mayor of Arnhem. Apart from this, the internet did not speedily yield his other activities in the years after leaving NVB.

²⁸⁰ AFM AR 2006 p. 62/64.

²⁸¹ Dutch Employers Association= VNO-NCW.

²⁸² According to the periodical Management Scope, in 2016 Wientjes was chairman of the council of commissioners of KPMG (president-commissaris; the council is supposed to supervise the management), and professor of economics at Utrecht University. On 4/9/13 he received an honorary medal from the Dutch ministry of foreign affairs, the Eretekens van Verdienste. (Wikipedia “Bernard Wientjes” 2/5/17).

²⁸³ Literally (euphemistically, metaphorically): “space”.

²⁸⁴ AFM AR 2006 p. 112/114.

and self regulation.²⁸⁵

7. The conclusions and recommendations of the inquiry commissions with respect to supervision.

Conclusion 2 of the FCIC majority reads:

«We conclude widespread failures in financial regulation and supervision proved devastating to the stability of the nation's financial markets.»²⁸⁶

The FCIC minority of 3 on the other hand does not mention regulation or supervision among the 10 “essential causes” of the crisis.²⁸⁷

The FCIC had not been asked to make recommendations, and it doesn't give them. (It was asked to find the causes). The FCIC majority clearly shows the failure of the supervisors. But it does not analyze or indicate the cause of this failure. Because of their fundamentally deficient analysis, measures based only on the reports of FCIC majority or minority cannot not be expected to be effective.

The first report of the CDW gives several recommendations about supervision. At first glance these seem to be a good beginning. But a closer look reveals that they are insufficient. This can be blamed on the inadequate analysis they are based on. Nothing is said about the integrity and competence of the top, about the selection of the top, about whistleblowing and the silent thousands, and the annual reports. The CDW report suggests a shortage of powers. It recommends reduction of liability of supervisors. This probably means: liability with respect to the institutions under supervision. (It is not explained why this is or was a problem). Much more serious is the problem of liability for social damage²⁸⁸ caused by culpable negligence and other misconduct of a supervisor. None of the recommendations creates or strengthens incentives for appropriate conduct, and/or disincentives for misconduct.

Although pp. 15-17 of Paulson's *Blueprint for a modernized financial regulatory structure* of 2008²⁸⁹ says and proposes important things about the role of the Fed with respect to systemic risk, it seems to start from incorrect premises. It seems to assume that the Fed failed due to a lack of information and authority. As the Chronicle has shown, this is nonsense.²⁹⁰ The Fed completely ignored its responsibility with respect to systemic risk. Probably because mr. Greenspan believed in self regulation, and had a repressive attitude, and all other people in power had been selected for similar beliefs and/or subservience. But as regards improvement of the procedures for selecting and/or appointing managers and other employees, no action is taken.

7B.6. International and other organizations involved in financial-economic affairs.

The Bank of International Settlements (BIS).

Introduction.

«The BIS is an international organization that fosters international monetary and financial cooperation and serves as a bank for central banks. Its head office is in Basel, Switzerland, and it has

²⁸⁵ The quotes show a purely political, dogmatic “argumentation”, a complete absence of any sound argument. They give no evidence proving the safety of the system and the (net) harm done by supervision. No refutation of the arguments of the GAO, BIS-CGFS or OFHEO. Etcetera. The quotes belong in a shouting match.

²⁸⁶ FCIC p. xvii/18.

²⁸⁷ FCIC pp. 417-9/445-7.

²⁸⁸ Social damage= the (all) damage done to human society, or simply all damage caused.

²⁸⁹ In the dossier under 20080331.

²⁹⁰ To a certain extent, the lack of information is correct, but the Fed knew it lacked crucial types of information, and refused to do anything about it. That was the problem, not the lack of information itself.

two representative offices, one in the Hong Kong Special Administrative Region of the People's Republic of China and one in Mexico City. The Bank currently employs 554 staff from 49 countries.»²⁹¹

«BIS Mission Statement

Excellence in service to central banks and financial authorities

The BIS

- Aims at promoting monetary and financial stability
- Acts as a forum for discussion and cooperation among central banks and the financial community
- Acts as a bank to central banks and international organizations

BIS staff emphasize

- excellence in performance
- highest ethical standards
- professional discretion»²⁹²

«The Bank also hosts the secretariats of a number of committees and organizations that seek to promote financial stability:

- The Basel Committee on Banking Supervision, the Committee on the Global Financial System, the Committee on Payment and Settlement Systems and the Markets Committee have been established by the Governors of the G10 central banks over the past 40 years. They enjoy a significant degree of autonomy in setting their agendas and structuring their activities.
- The Financial Stability Forum, the International Association of Insurance Supervisors and the International Association of Deposit Insurers are independent organizations that do not directly report to the BIS or its member central banks.»²⁹³

For information about BIS as an organization, including its management, see the BIS appendix or a BIS annual report.

Conclusions.

1. The role of BIS in the run up to the financial crisis has been evaluated on the basis of the following reports:
 - CGFS²⁹⁴ 20: Credit risk transfer (CRT, January 2003);
 - Joint Forum CRT (March 2005);
 - CGFS 26: Housing finance in the global financial market (January 2006);
 - BIS AR 2006 (June 2006);
 - Joint Forum CRT (July 2008);
 - BIS AR 2009 (June 2009).
2. The reports can be characterized as follows:
 - CGFS 20 on CRT (2003). Notes important risks and obscurities, but handles them irresponsibly and unprofessionally. Makes no recommendations, but restricts itself to outlining issues;
 - Joint Forum CRT (2005). Gives a defective analysis. Implicitly, and only implicitly, shows an utterly unacceptable and very risky state of affairs in and among market participants. Presents valuable recommendations. However, implementation is entirely noncommittal, and

²⁹¹ BIS-AR 2006 p. 155/165.

²⁹² <http://www.bis.org/about/mission.htm>, 13/8/12.

²⁹³ BIS AR 2006 p. 155/165.

²⁹⁴ CGFS= Committee on the Global Financial System.

- governments are not addressed;
- Housing finance (2006). Lacks involvement and shows irresponsible wishful thinking. Makes very soft and non-binding recommendations;
 - BIS AR 2006 (2006). Inadequate as an annual report, because it ignores a large part of the activities of central banks. Analytically it is inadequate too, because of restriction to global/macro aspects, without proper regard for the (potential) influence of micro on macro;
 - Joint Forum CRT (July 2008). There is no evaluation of the implementation of the recommendations of the 2005 report. The earlier recommendations are supplemented with a few new ones. In spite of recent events there is no substantial change with respect to 2005. No vigorous action. Nothing was learned;
 - BIS AR 2009 (2009). Contains useful information about the crisis, but is analytically defective. Like the former annual reports, this one is written as if BIS has perfect knowledge and understanding. There is no trace of awareness of having failed. There is no sign of correction.
3. None of the BIS reports mentions the GAO reports of 1994-1999, acknowledges the correctness of its analyses, and supports its recommendations. Even though there is much overlap in subject matter;
 4. The Housing finance report (CGFS 26) mentions neither OFHEO nor “systemic risk”;²⁹⁵
 5. In spite of overlapping duties, the annual reports of BIS do not mention specific or groups of supervisors, shared opinions or generally supported recommendations;
 6. The reports suggest that they tell the one and only true story. They suggest that no other interpretations, points of view, and opinions are possible and actually exist;
 7. Both ethics and risk management require reports like those of financial supervisors to contain all relevant opinions, judgments etcetera, together with arguments for and against.²⁹⁶ Publishing a single (compromise) opinion, conclusion, etcetera is a demonstration of lack of openness. It is unrealistic, misleading, and potentially dangerous;
 8. As regards the BIS reports it would seem that deviating argumentation and opinions were not judged on their intrinsic merits, but ignored or left unmentioned for unexplained reasons, or modified in a compromise. This is incompatible with professionalism and the mission statement of BIS;²⁹⁷
 9. To a certain extent the reports can be understood as a compromise between material and dogmatic or political motives. To a certain extent, because such compromising is contrary to BIS’ mission statement;²⁹⁸
 10. Some reports frequently express uncertainty. The supervisors do not conclude however that this requires risk management by themselves. That is: by the supervisors. In this regard, they actually assume certainty (about safety, adequacy of self-regulation, etcetera);
 11. What BIS calls annual reports are no annual reports. They do not give an account of what BIS did in the given year. Instead they present macro-economical reviews, similar to those found in the “annual reports” of most other supervisors, IMF and OECD. A (too) short annual report can be found in the appendices of the “annual report”;
 12. The reports can only be explained as results of insufficient integrity and professionalism, inadequate management (including absent coordination), and compromises with dogmatic and/or stupid authorities.²⁹⁹ It is not a matter of lack of information and underestimation of risk, but of intolerance for opinions which differ from those of the top, and refusal to reason and discuss on the basis of arguments. And of the subservience and cowardice of those who understand that this is an unprofessional and unethical practice, and increases the systemic risks;

²⁹⁵ The other reports have not been checked for these terms.

²⁹⁶ Unless convincingly refuted of course.

²⁹⁷ It is incompatible with the “highest ethical norms”: other opinions and people are not respected. Due care requires openness and respect for other opinions and arguments, except when it can be (rigorously) proven that they are wrong. In economics this is rarely possible, if at all.

²⁹⁸ In other words: the mission statement omits mention of norms and values which in practice are more important than those mentioned.

²⁹⁹ Of course this can all be seen as management failures (too).

13. The reports show that the reality of BIS is incompatible with its mission, and that the mission statement is misleading. Examples:
 - “Excellence”: because of very unprofessional and unexplained conduct in vital matters this is plain nonsense;
 - “BIS aims at promoting monetary and financial stability”: Although “promoting” is elastic, and BIS did promote a little bit, it did not do by far what it could and should have done;
 - “BIS staff emphasize highest ethical standards”: the reports show a complete lack of openness,³⁰⁰ and actually are misleading. High ethical standards require openness, for example about compromises;
 - Failures of BIS are not acknowledged, and nothing is done to show the public that the defects indicated in the present conclusions will be repaired, and integrity and competence fundamentally improved.
14. Instead of working in accordance with its mission statement, BIS seems to have worked under the inviolable boundary condition, that nothing is to be said or done that is incompatible with the policy of any of the major supervisors (especially the US Fed). In other words: BIS operated as a political organization;
15. If BIS would consider its mission statement as no more than a noncommittal ideal, and that it cannot and need not respect the norms and values it incorporates, for example because compromises have to be made with central banks and/or others beyond its control,³⁰¹ then it could and should say so in the mission statement. Otherwise it gives rise to the suspicion that the mission statement is primarily meant to mislead the public;
16. The recommendations in the reports are noncommittal. There is never a sense of urgency. Members, participants or supervisors are not asked to report progress. Neither is implementation monitored by BIS (CGFS);
17. None of the reports informs outsiders in a clear way. Texts often are political and/or cryptic.

For substantiation the reader is referred to the appendix, and/or the reports mentioned under point 1.³⁰²

The European Central Bank (ECB).

Introduction.

The ECB is part of the Eurosystem: the set of organizations made up of the ECB and the national central banks of the EU member states whose currency is the euro. For evaluation purposes it is necessary to distinguish the missions and tasks of the different parts of the system.

«The mission of the European Central Bank

The European Central Bank and the national central banks together constitute the Eurosystem, the central banking system of the euro area. The main objective of the Eurosystem is to maintain price stability: safeguarding the value of the euro.

We at the European Central Bank are committed to performing all central bank tasks entrusted to us effectively. In so doing, we strive for the highest level of integrity, competence, efficiency and transparency.

The mission of the Eurosystem

The Eurosystem, which comprises the European Central Bank and the national central banks of the Member States whose currency is the euro, is the monetary authority of the euro area. We in the Eurosystem have as our primary objective the maintenance of price stability for the common good. Acting also as a leading financial authority, we aim to safeguard financial stability and promote European financial integration.

³⁰⁰ In this study openness means: (timely) reporting everything that may be of importance in the given context. It is a form of completeness, and the opposite of secrecy.

³⁰¹ Even though these may have nice codes of conduct too.

³⁰² In the dossier.

In pursuing our objectives, we attach utmost importance to credibility, trust, transparency and accountability. We aim for effective communication with the citizens of Europe and the media. We are committed to conducting our relations with European and national authorities in full accordance with the Treaty provisions and with due regard to the principle of independence.

We jointly contribute, strategically and operationally, to attaining our common goals, with due respect to the principle of decentralization. We are committed to good governance and to performing our tasks effectively and efficiently, in a spirit of cooperation and teamwork. Drawing on the breadth and depth of our experiences as well as on the exchange of know-how, we aim to strengthen our shared identity, speak with a single voice and exploit synergies, within a framework of clearly defined roles and responsibilities for all members of the Eurosystem.»³⁰³

«Basic tasks

According to Article 127(2) of the Treaty on the Functioning of the European Union, the basic tasks to be carried out through the Eurosystem are:

- o the definition and implementation of monetary policy for the euro area;
- o the conduct of foreign exchange operations;
- o the holding and management of the official foreign reserves of the euro area countries (portfolio management);
- o the promotion of the smooth operation of payment systems.

Further tasks

- o Banknotes: the ECB has the exclusive right to authorize the issuance of banknotes within the euro area.
- o Statistics: in cooperation with the NCBs,³⁰⁴ the ECB collects statistical information necessary in order to fulfill the tasks of the ESCB, either from national authorities or directly from economic agents.³⁰⁵
- o Financial stability and supervision: the Eurosystem contributes to the smooth conduct of policies by the competent authorities as regards the prudential supervision of credit institutions and the stability of the financial system.
- o International and European cooperation: the ECB maintains working relations with relevant institutions, bodies and fora, both within the EU and at the global level, in respect of the tasks entrusted to the Eurosystem.»³⁰⁶

“Safeguarding financial stability” is listed in the first paragraph of the mission statement of the Eurosystem and as its third “further task”. It gets due attention in the annual reports of the ECB. Furthermore the ECB publishes a “Financial stability review” (FSR) twice yearly, and a report Banking sector stability (BSS) once a year.

The following conclusions are based on a study of the events and the following ECB reports:

- ECB Banking sector stability (BSS) report November 2006 (dated 20061106).
- ECB Financial stability review (FSR) December 2006 (dated 20061211).
- ECB Annual report 2006 (dated 20070410).
- ECB FSR December 2008 (dated 20090107).
- ECB Annual report 2008 (dated 20090415).
- ECB BSS report August 2009 (dated 20090828).
- ECB FSR June 2010 (dated 20100531).

From the evaluation of these reports it was concluded that studying more reports has little or no added value.

For the substantiation of the following conclusions the reader is referred to the appendix ECB.

³⁰³ ECB website, 24/8/14. https://www.ecb.europa.eu/ecb/orga/escb/html/mission_eurosys.en.html.

³⁰⁴ NCBs= national central banks.

³⁰⁵ ESCB= European System of Central Banks.

³⁰⁶ ECB website, 24/8/14. <https://www.ecb.europa.eu/ecb/tasks/html/index.en.html>

Conclusions.

1. The reports give no indication of the size and consequences of the different risks. Nothing is said about scenario's following the realization of a risk. The reports assume that it is sufficient to note that there is a risk, and/or that it has de- or increased. As a consequence, all risks are considered equal. The reader can only guess at their importance.³⁰⁷
2. Nothing betrays knowledge or understanding of the GAO 1994-1999 reports, and nothing in the ECB reports shows analytic capabilities comparable to those of the GAO. Or of the OFHEO and CGFS 2003 reports.
3. AR 2006 pays attention to government deficits and debts. It stresses the need of fiscal balance³⁰⁸, and of continuation of efforts to reduce deficits and debts. But it does not note that large government debts may be a risk to the financial economic system, and the freedom of operation in general. Even though the average gross government debt of the OECD countries in 2006 was 77%, and the debts of Greece and Italy were above 120%, twice the agreed EU criterion.³⁰⁹
4. In the end, the impression that remains after reading in the selected reports is dominated by ill founded optimistic interpretations ([«...are likely to have enhanced EU banks' resilience to shocks»](#)) or plain wishful thinking. And of lack of clarity about the role and involvement of the ECB.
5. The reports lack recommendations or proposals for action, and do not draw conclusions as regards ECB or other policy. There are many analyses, but they rarely lead anywhere. There are weak exceptions. For example on p. 5 of the BSS report 2006:
[«Nevertheless, the strength of competition in mortgage markets and the potential for the adoption of the rules of the new Basel II Capital Accord in the short-run to release additional regulatory capital, thereby possibly supporting further mortgage lending activity, suggests that banks need to carefully monitor the risks they are taking in mortgage markets.»](#)
This is said in the running text. Not in a list of recommendations or conclusions.
Recommendations are important in themselves, but also because studying phenomena with an eye to recommendations imposes conditions on the analysis. These conditions preclude superficiality and a noncommittal character, and greatly stimulate thinking.
6. According to its own norms, the ECB did not ensure and/or safeguard the stability of the EU financial system adequately. It did and does not even identify the main sources of risk and vulnerability.
7. Like all reports of all supervisors and related organizations, and although they write about the same subjects, the reports of the ECB show little cooperation or division of labor with other supervisors and related organizations.³¹⁰ On the contrary: ECB evaluates the stability of the banking sector on the basis of market indicators and assessments by rating agencies, not on the basis of evaluations by its partners in the Eurosystem.
8. The reports following the crisis of September 2008 give no evaluation of the ECB's inaction and reports published before the crisis. It acknowledges no errors or deficiencies, and does not show any fundamental correction or improvement.
9. A major weakness of all ECB's analyses seems to be that they refuse to say anything that could relate (man made) disastrous events to specific people or organizations.

The International Monetary Fund (IMF).

Introduction.

[«The International Monetary Fund \(IMF\) works to](#)

³⁰⁷ This applies to most supervisor publications, and those of for example IMF and OECD.

³⁰⁸ Fiscal balance= equality of income and expenditure.

³⁰⁹ The numbers are taken from Table 32 of OECD Economic Outlook nr 80 of December 2006 (2006-2). For the EU criteria see the Chronicle.

³¹⁰ Both with national and international organizations. Relevant if not simply better are the Economic Outlook of the OECD and the Global financial stability reports (GFSR) of the IMF. All can be found on the internet or in the dossier.

- foster international monetary cooperation,
- secure financial stability,
- facilitate international trade,
- promote high employment and sustainable economic growth, and reduce poverty around the world.

Created in 1945, the IMF is governed by and accountable to the 188 countries that make up its near-global membership.»³¹¹

«The Board of Governors, the highest decision-making body of the IMF, consists of one governor and one alternate governor for each member country. The governor is appointed by the member country and is usually the minister of finance or the governor of the central bank. All powers of the IMF are vested in the Board of Governors. The Board of Governors may delegate to the Executive Board all except certain reserved powers. The Board of Governors normally meets once a year.»

«The Executive Board (the Board) is responsible for conducting the day-to-day business of the IMF. It is composed of 24 Directors, who are appointed or elected by member countries or by groups of countries, and the Managing Director, who serves as its Chairman. The Board usually meets several times each week. It carries out its work largely on the basis of papers prepared by IMF management and staff.»

The managing directors of the period 2000-2012 were:

- C. Lagarde 5/7/11-
- D. Strauss-Kahn 1/11/07-18/5/11
- R. de Rato 7/6/04-31/10/07
- H. Köhler 1/5/00-4/3/04
- M. Camdessus 16/1/87-14/2/00.

(There are some gaps indeed).

The head office of the IMF is in Washington D.C.

Around 2012 the IMF had approximately 2600 employees.³¹²

The following conclusions are based on a study of the facts and the following IMF reports:

- IMF Global financial stability report (GFSR) 2005-2 (September 2005)
- IMF GFSR 2006-1 (April 2006)
- IMF AR 2006 (September 2006)
- IMF GFSR 2007-1 (April 2007)
- IMF AR 2009 (July 2009).

For substantiation of the conclusions see the IMF appendix.

Conclusions.

1. The role of the IMF with respect to supervisors and governments is unclear, and not discussed. As a consequence the meaning and status of the advice of the IMF is unclear. The unsystematic character and the lack of specification of the advice, and the absence of any kind of monitoring of its implementation, suggest that it isn't clear to the IMF itself either.
2. Until the GFSR of April 2007, reckless optimism is the rule. Opportunities are exaggerated in the optimistic sense, while risks are underestimated. In the GFSR of April 2007 the rose colored glasses have been largely taken off.
3. “To secure financial stability” is one of the four main duties of the IMF. AR 2006 claims that the IMF has “tools for identifying vulnerabilities and weaknesses in its member countries and in the international financial system so that they can be addressed before a crisis erupts”. The reports

³¹¹ Factsheet IMF, 8/8/12. The points have been added for clarity.

³¹² Factsheet IMF, 8/8/12.

don't identify or describe these tools. Neither do they show which "vulnerabilities and weaknesses" they have helped identify. In fact the IMF shows no knowledge or insight better than that of other organizations. IMF studied dangers only superficially, and overestimated positive developments and the supposed stability. IMF not only failed to secure stability, but even failed to warn of real dangers.

4. The reports say nothing about the size and consequences of the risks. No effort is made to trace the consequences of a realized risk, and to describe them in a scenario. No (comparative) analysis of size and consequences was found in the reports. Risks are not distinguished; they could as well be equal. Nothing is said about a method for finding sources of risk; there is no guarantee for completeness.
5. Unbalanced balances of payments are mentioned as a destabilizing factor, government debts are not. The IMF should have done so, and taken action not only to secure stability, but also to prevent being asked to provide (additional!) loans to countries that got themselves into this kind of trouble. Its mission required it to warn timely, clearly and unambiguously, and to make unambiguous recommendations. It could simply have supported those of the GAO.
6. Global imbalances are called imbalances, and seen as a problem. However: why they are a problem and/or risk, and how they can be solved or reduced is not explained.
7. The IMF has 2600 employees. It is impossible to believe that none of them can deliver anything better than what can be found in the reports. The reports therefore show that the management is insufficient. And if the IMF really has no people who can produce anything better, it is just as insufficient.
8. The reports give useful information.³¹³ The information makes an ad hoc impression however. No effort seems to have been made to collect the information necessary for accomplishing the mission, and to present the information in a helpful way. In general, the analyses are superficial.
9. IMF gave potentially effective opinions and advice, but ad hoc instead of systematically. And it did next to nothing to explain the necessity of action. It did not show the consequences of inaction.
10. None of the reports betrays knowledge or understanding of the GAO 1994-1999 reports, and nothing in the IMF reports shows analytic capabilities comparable to those of the GAO. The OFHEO and CGFS reports are ignored as well. In other words: IMF is not acquainted with the literature it should be acquainted with because of its duties and mission.
11. Still, the GFSR of April 2007 sees more risks than all other supervisors. But the IMF overestimates the supposed stability of the financial system just as much as it underestimates the risks. What advice it gives is extremely undercooled.³¹⁴
12. The weakness of the analyses and recommendations in the reports agrees with the failure of IMF to prevent the crises and deal with them. It failed to secure financial stability, a vital part of its mission. Its pretensions were false.
13. There is no sense of urgency and responsibility in any of the studied reports.
14. The IMF has not learnt the most important lessons of the crisis. It has not acknowledged its failure. It has not changed in any fundamental way.
15. There is a general lack of reflection, especially as regards definitions. Hypotheses (illusions) are mistaken for facts. No effort is made to discover and analyze the sequence of consequences which follows the realization of a risk.
16. The IMF is not honorable and not competent. It is utterly unreliable.

The Organization for Economic Cooperation and Development (OECD).

The mission of the OECD.

«The mission of the Organization for Economic Co-operation and Development (OECD) is to

³¹³ Although less and less useful than those of the OECD. Cooperation would be welcome, both from the point of view of efficiency and effectiveness.

³¹⁴ For example: «... ensuring that underwriting standards are maintained is critical to supporting market discipline and, in this regard, recently issued guidelines are welcome.». P. 32 of IMF GFSR April 2007.

promote policies that will improve the economic and social well-being of people around the world.

The OECD provides a forum in which governments can work together to share experiences and seek solutions to common problems. We work with governments to understand what drives economic, social and environmental change. We measure productivity and global flows of trade and investment. We analyze and compare data to predict future trends. We set international standards on a wide range of things, from agriculture and tax to the safety of chemicals.

We look, too, at issues that directly affect the lives of ordinary people, like how much they pay in taxes and social security, and how much leisure time they can take. We compare how different countries' school systems are readying their young people for modern life, and how different countries' pension systems will look after their citizens in old age.

Drawing on facts and real-life experience, we recommend policies designed to make the lives of ordinary people better. We work with business, through the Business and Industry Advisory Committee to the OECD, and with labor, through the Trade Union Advisory Committee. We have active contacts as well with other civil society organizations. The common thread of our work is a shared commitment to market economies backed by democratic institutions and focused on the well-being of all citizens. Along the way, we also set out to make life harder for the terrorists, tax dodgers, crooked businessmen and others whose actions undermine a fair and open society.»³¹⁵

The OECD's "core values".

- «Objective: Our analyses and recommendations are independent and evidence-based.
- Open: We encourage debate and a shared understanding of critical global issues.
- Bold: We dare to challenge conventional wisdom starting with our own.
- Pioneering: We identify and address emerging and long term challenges.
- Ethical: Our credibility is built on trust, integrity and transparency.»³¹⁶

The following conclusions are based on a study of the Economic Outlooks of 2006-2008 and the facts of the crisis.

Conclusions.

1. The Economic Outlooks contain much valuable information and many relevant observations.
2. The Economic Outlooks have noted the relevant developments with respect to mortgages, balances of payments and government debts, and timely. But they only saw the superficial phenomena. They showed no understanding or even interest in the operation of financial markets.
3. Analytically they are far too superficial. They cannot serve as a basis for recommendations and forecasts.
4. The substantiation of the recommendations leaves very much to be desired. Often they assume risks. But they do not give emphatic warnings. There is no analysis which shows what will happen if something is done or not done.
5. The Economic Outlooks, not in the last place remarks like “steady growth ahead”, suggest business as usual. There are always threats, and there is always room for improvement. But there are no exceptional threats, and nothing that needs to be dealt with urgently.
6. The Economic Outlooks do not refer to conclusions and recommendations of similar studies of similar or related organizations, such as national supervisors and BIS, ECB, GAO, and IMF.
7. There is no trace of modesty, or doubt about economic knowledge and understanding. The OECD gives advice and recommendations as if it were omniscient. After the crisis as before.
8. The OECD's implicit pretension, that it can assess and forecast, is false.
9. The Economic Outlooks are incompatible with the OECD's core values.
10. The OECD has not acknowledged its failure. After the crises, it has not changed in any fundamental way.

³¹⁵ www.OECD.org 3/1/13. Regrettably no mission or similar statement could be found for 2006.

³¹⁶ www.OECD.org 3/1/13. The layout has been slightly adapted.

There is no essential difference with the supervisors.

The Dutch General Accounting Office (DGAO)³¹⁷⁾.

Conclusions (partly based on evidence and analyses presented in earlier chapters).

1. The members of the DGAO are selected by the political establishment.
2. The reports of the DGAO are incompatible with faithful execution of its mission. The reports claim that they critically evaluate government activities. In reality its criticism is superficial at best. Its existence and way of working prevent substantial improvement and protect the status quo.
3. After the crisis the DGAO investigated the Dutch Central Bank (DNB). In other words: it pretends to be the competent to do that. Why then did it make this inquiry so late? It could very easily have seen that (at least) the annual reports 1998-2008 of the bank are unacceptable both in a material and technical sense.³¹⁸
4. After the crisis it did not acknowledge failure, and did not change for the better.

■
The appointment of the members of the Dutch General Accounting Office (DGAO) is political:
«The members of the DGAO are appointed for life by royal decree on the basis of a nomination of three persons made by the Second Chamber of Parliament.»³¹⁹

The royal decree is no more than a government decision.

Directly under the heading of the Factsheet³²⁰ of June 2010 with general information about the DGAO one reads:

«The purpose of the DGAO is to assess and improve the lawful, efficient, effective and honorable functioning of the government and the related organizations. In addition it is the responsibility of the DGAO to contribute to good public administration by exchange of information and cooperation at home and abroad.»

One of the sections of the Factsheet is the following:

«Good public administration.

We investigate both the performance and the functioning of the government. This means that we investigate to what extent policy is implemented effectively, efficient and demand-oriented, and evaluate integrity, transparency and public accounting. In this way we want to help improve the learning ability of public administration. To this end we will pay attention to the information management of the government and to the degree of balance between policy ambitions and available time, money, human resources and means in every investigation in the coming years.»

It is clear that because of its mission, the DGAO should have called attention to the deficient annual reports of the Dutch Central Bank, and that after the financial crises and the inquiries of CDW and FCIC it should have published an analysis like this chapter.³²¹ It should have pointed out the essential deficiencies of these inquiries. The reason for its silence cannot be that it considers itself insufficiently competent for such an analysis. Earlier chapters have shown that the DGAO frequently publishes reports about technical subjects, and also about integrity. After the crisis the DGAO made

³¹⁷ In Dutch: Algemene Rekenkamer.

³¹⁸ In a technical sense= as an annual report, that is: as a report about the activities in the year under review.

³¹⁹ Article 77 paragraph 1 of the Dutch constitution. Other aspects are regulated by the other paragraphs of article 77 and by article 78 of the constitution, and by chapter 4 of the accountability law (comptabiliteitswet). Source: Kluwer Collegebundel 2000/01.

³²⁰ In the dossier, under 20120913. The Factsheet has two pages.

³²¹ Regrettably this means making contradictory assumptions, and is therefore impossible. If DGAO had done this, it would have reported critically long before the crisis erupted. The same causes of silence before the crisis prevent its speaking afterwards.

several inquiries of aid programs for banks, and about supervision.³²²

Something similar applies to the US GAO. See the description of its mission on pp. 7-8/ 13-14 of the GAO Performance and Accountability Report 2004. It is summarized on p. 2/2:

«GAO exists to support the Congress in meeting its constitutional responsibilities and to help improve the performance and ensure the accountability of the federal government for the benefit of the American people.»

It is obvious that in 2000-2007 the GAO, like the DGAO, has failed its mission very badly.³²³

Like other supervisors the DGAO says next to nothing about the relative importance of different kinds of deficiencies. Little distinction is made between very important and relatively unimportant deficiencies. The DGAO moreover belittles problems by euphemisms. Two examples from the annual report 2012:

1. «As a consequence, countries can still hardly get a complete and reliable picture of each other's financial position. That does not contribute to good decision making.» The last sentence is euphemistic, and therefore unclear. It may have been meant to hide the following: "That hinders accountable decision making, and may make it impossible".
2. «Democratic constitutional states are based on sufficient and correct information which governments give society and its representatives. This applies pre-eminently in these economically particular times.»³²⁴ The "particular" sounds rather ridiculous, because almost everybody refers to these times as "economically bad or difficult times". With good reason of course. One wonders whether this text was written or edited by somebody who softened everything that seemed negative or critical.

But not all unfounded value judgments have been deleted:

«At European level the countries concerned, including the Netherlands, cooperate as good as possible to fight the debt crisis.»³²⁵

The qualification "as good as possible" is not specified or substantiated, and can be deleted without loss. Or rather: can better be deleted, for deletion would avoid the impression of prejudice and unfounded propaganda. For is cooperation in Europe new? Is this specific cooperation necessary? Why? Why only now? Did the DGAO note in earlier years that the Maastricht convergence criteria were ignored, at unknown but potentially great risk? Why only this positive remark, without explanation and proof of the "as good as possible"?

Organizations like DGAO and GAO have to cope with the problem that their resources are far too small to evaluate all government and related activities. They have to make choices, because they can evaluate only relatively few random samples. And they have to ask themselves what their findings mean for the system as a whole, given their dependence on the cooperation of investigated organizations. It is not self evident how they should sample. But even more important for the efficacy and efficiency of their work is that the product of the probability to get caught and the fine is- should be- sufficiently large to be preventive and corrective. It isn't. Furthermore, organizations like DGAO and GAO can investigate and publish findings, but cannot take measures.³²⁶ Whether something is done with their reports depends on others. Sometimes it depends on organizations like ministries, often on governments and/or parliaments. If organizations like DGAO and GAO were honorable, they would be open about these and similar facts, and explain their limited possibilities on their website and in information brochures like the factsheet quoted above. An honorable organization makes sure that people have no illusions about the effectiveness of their activities. They could somewhat strengthen

³²² The DGAO published at least 4 progress reports about the credit crisis (Kredietcrisis), and a report *The supervision of DNB on the stability of banks (Toezicht van DNB op de stabiliteit van banken, 2011)*.

³²³ The defense that the preceding decade (say) has shown reliable evaluations to be without any positive effect is false, because correct and timely information of the public is a condition sine qua non for a democratic society. Without full and reliable information, people's choices have no defensible meaning.

³²⁴ DGAO AR 2012 p. 14/16 first paragraph.

³²⁵ DGAO AR 2012 p. 4/6, the beginning of the section Europe.

³²⁶ To a certain extent there is a chance to get caught, but the fine is certainly zero. Apart from temporary loss of face. The chance to get caught and negative publicity is reduced by the fact that as a rule, DGAO needs or wants cooperation of the organization under investigation, and will need its cooperation in the future too.

their position by including overviews of earlier findings and recommendations and the reactions of those concerned in their annual reports. Especially by noting the absence of adequate reactions or corrective measures. At present they don't (or rarely). Instead they contribute to the continuation of the belief in incorrect illusions. The Factsheet DGAO suggests very much more than warranted. The DGAO cannot do what it asserts, and does even less than what it can do. The DGAO undoubtedly does some useful work. But it does not do what it has to do, and shows no more modesty and integrity, and no less false pretensions than other supervisors. Its support of illusions prevents substantial improvements and protects the status quo.

7B.7. The inquiry commissions CDW and FCIC.

Table of contents of this section.

The table can be read as a staccato summary.

1. Summary and conclusions.
2. Agreements and differences between the conclusions of the FCIC and this study.
3. Lack of integrity and competence of CDW and FCIC, and its consequences.
4. Methodological deficiencies of the CDW and FCIC inquiries and their consequences.
5. The "Intermezzo: images of the Dutch Central Bank": an example of the inadequate approach of the CDW.
6. The commissions don't eliminate the ambiguity of the concept "cause". They don't check completeness.
7. The inquiry of the FCIC has important gaps, serving specific interests.
8. Neither CDW nor FCIC tries to find causes of observed general misconduct.
9. The commissions ignore important facts, with fatal consequences for their conclusions.
10. A missing conclusion: for all key functions politicians had appointed inappropriate persons.
11. How the commissions enable the principal persons to retain similar functions.
12. The FCIC, GSEs and the affordable housing goals.
13. Supervision failed far worse than shown by the inquiry commissions.
14. A missing conclusion: the failure of supervision and government is unthinkable without repressive hierarchical organization.
15. The commissions pay no attention to the influence of liability and criminal law.
16. After the outbreak of the crisis only appearances improved: with another man's money everyone can solve almost every problem.
17. The interviews and parliamentary inquiries as cover up.
18. Support for the hypothesis that a parliamentary inquiry is not meant seriously: eight years after recommendations of an inquiry commission for improvements of accountancy, accountancy turns out to have improved insufficiently or not at all.
19. Two Irish inquiry reports.

1. Summary and conclusions.³²⁷

1. For this chapter the work of three inquiry commissions has been studied: the Dutch Commission De Wit (CDW), the US Financial Crisis Inquiry Commission (FCIC), and the two Irish inquiry commissions. The first two were studied mainly in 2011 and 2012, the third was discovered only in August 2014.³²⁸ In all important respects the first two reports are similar. They will be treated

³²⁷ Conclusions may be partly based on analyses in other sections of this chapter.

³²⁸ The CDW published a second report in 2012. It is the report of a relatively extensive inquiry into developments in the Dutch financial sector in the years of the subprime crisis, especially those which were supposed to require aid from the Dutch government. Like the first report, the second is very useful and interesting. The second report supports the conclusions of the present study regarding integrity and competence of the principal persons and organizations. Especially Wellink and DNB, and the minister of finance (Bos). It

intertwined. The Irish inquiries are more open, and will be treated separately. International financial economic developments since the crisis are compatible with the assumption of representativeness of the CDW and FCIC. Therefore no great efforts have been made to find reports of similar inquiries in other countries. The following points 2-22 (inclusive) refer only to the CDW and FCIC.

2. The CDW and FCIC were composed by parliaments. They were asked to find the causes of the crisis. The members of the commissions have no demonstrable research competence. For this reason it is doubtful whether acceptance to make or lead the inquiry and accept responsibility for it can be called honorable. The incompetence is shown in important methodological errors. The great weight the commissions accord to hearings of people who may be held responsible for causing the crisis and increasing its harmful consequences, and the simultaneous neglect of relevant contemporary documents seem to be the most important examples. Most of the people interviewed were vitally interested in hiding part of the truth and giving an incorrect representation of developments and activities.
3. The commissions state that they studied very many documents. But they give no report of this study, and most of their quotes are not from documents but from hearings.³²⁹
4. If they had really studied the relevant contemporary documents, then there would have been no need to interview people like Bernanke, Bos, Geithner, Greenspan, Paulson, Wellink and Zalm. There are essential contradictions between their utterances after the crisis and documents from before the crisis. If the commissions note the contradictions (and misleading half truths) at all, then in very soft terms.
5. The CDW and FCIC have done very much useful work. They collected and ordered much information. But their work is not well balanced, and fatally incomplete. The commissions did not distribute their attention and efforts proportional to the contribution of the various factors to the origin and size of the crisis. Banking and modern securities got far too much attention; government and supervision far too little. Because it has to be concluded that there would not have been crises if these had functioned properly, a thorough inquiry into the causes of their failure was imperative.
6. The inquiry commissions give no attention to the internal operation of the hierarchical organizations which had responsibilities with respect to parts of the financial system. They give no attention to the functioning of their codes of conduct and other relevant codes. They do as if a hierarchical organization is a single person, the highest boss (CEO, director, etcetera). This way of thinking is misleading³³⁰ because it is unthinkable that none of the many thousands of employees in supervision, HUD and ministries of finance, advocated more responsible conduct, and on very good grounds. Hierarchical organization makes repression easy, and can prevent (self)correction. Because of his power, the operation of hierarchical organizations depends very strongly on the quality of the top functionary. Acceptance of the simplistic anthropomorphism and the refusal to study the internal operation of responsible organizations preclude correction.
7. The CDW and FCIC did not try to find the (changeable) causes of the inadequate operation of government and supervision. Even though it is completely unclear why one should believe that government and supervision can and will correct themselves of their own accord. The FCIC is sharp in many of its accusations, but denies and condones misconduct of the government.³³¹
8. If the commissions tried to keep government (including parliament) out of the wind, they could hardly have done better.
9. The investigation of the role of the affordable housing policy by the FCIC was incomplete, biased and illogical.

didn't seem to be necessary and efficient to spend more time on this report for the present work. It is analyzed extensively in the Dutch report *Wellinks meineed (Wellinks perjury)*.

³²⁹ The staff studies of the FCIC are very useful, but also very selective. Annual reports and supervisor performance (in 1995-2006) are not studied, for example.

³³⁰ In fact, it is incorrect, both formally and informally.

³³¹ See for example the paragraphs around "we make the following observation about government housing policies" on p. xxvii/27 in the chapter *Conclusions of the FCIC*.

10. The Fed was obliged to take government policy into account. Perhaps other supervisors had a similar obligation. This may have caused significant weakening of supervision.³³² The commissions pay no attention to this observation.
11. The commissions do not give a logically closed explanation of the crisis. They do not note that supervision of supervision was completely missing.
12. The FCIC concludes that risk management and rating agencies are important causes of the crisis. This is misleading because the FCIC does not say what an adequate risk estimate should look like. Neither does it say what responsible parties should do if they had such an estimate. The FCIC does not say what a party should do in case of risks it cannot bear. (In particular if it cannot bear the totality of risks). The FCIC does not note that risk estimates depend on changing circumstances and forecasts, and are therefore changeable themselves. It does not note that realization of risks is uncertain, that risks may or may not be realized, and when.
13. The inquiry commissions do not show understanding of the problem of communication and warning about risks. They don't note that all (quasi)experts systematically and incorrectly suggested that only the most probable scenario is relevant. They don't remark that the attention to scenario's should be proportional to their expected³³³ consequences.
14. Neither CDW nor FCIC mention or discuss liability³³⁴ and punishability. This is a essential shortcoming both with respect to (dis)incentives and safeguarding innocents.
15. The inquiry commissions observe systematic dysfunctioning. They implicitly assume that the systematic character is caused by supposedly general human deficiencies. They do not (systematically) look for changeable causes.
16. The analyses of CDW and FCIC are untenable in the light of the GAO reports of 1994-1999 and the annual reports of the supervisors.
17. The neglect of the annual reports and other reports by the inquiry commissions means that the lack of integrity and competence of the financial supervisors and governments have not been analyzed, or not properly, and that nothing is done about it.
18. The shortcomings of the analyses and, as regards CDW, recommendations, mean- among other things- that people whose incompetence and lack of integrity is provable retain their position, or were allowed to move to similar or even more important functions. As a consequence, incompetent and dishonorable people will continue to (dys!)function and be appointed in all key positions in society. Which implies that society will unnecessarily continue running large and potentially catastrophic risks.
19. With their words and the thickness of their reports the CDW and FCIC suggest that they have brought to light what can be brought to light, and done what can be done. They didn't. Instead of instruments for correction they are protectors of dangerous frauds.
20. The selective treatment of the various aspects of the (subprime) crisis supports the impression that the inquiries of CDW and FCIC were more intended to prevent personal consequences for those who were responsible for the safe and sound operation of the financial system, than to find the causes and prevent repetition of this kind of crisis.³³⁵
21. The inquiry commissions pay no attention to education or science.
22. The failure of the CDW and FCIC, combined with that of supervisors and all other relevant persons and organizations, shows that the given modern states are unable to correct themselves. (It would be a dangerous understatement to suggest that their ability to correct themselves is "very insufficient").
23. The reports of the two Irish inquiry commissions consider the Irish banking crisis, and the international context in so far as relevant for the Irish financial system. They investigate the Irish

³³² That the formal obligation was practically important is shown by the declaration of Fed governor Bies in the FCIC hearing of 11/10/10 mentioned earlier. It is quoted in the Fed appendix. See also: FCIC p. 21/49.

³³³ "Expected" in probabilistic sense: the product of probability (the risk) and consequences (upon realization of the risk).

³³⁴ A search for "aansprakelijk" (= Dutch for liable) in CDW1 shows that CDW only uses this concept in connection with supervisors.

³³⁵ People like Coen Teulings, head of the Dutch Economic Advisory Office (CPB) asserted that crises are inevitable. Without any semblance of proof. See the report of the hearing of Coen Teulings in the report of the first series of hearings of the CDW.

system, and do not try to find the causes of the international financial crises. They are much more open than the inquiries of the CDW and FCIC, and shed important light on the internal functioning of all relevant organizations. Their conclusions overlap and are compatible with those of the present study. Their analyses go less deep however. For more detailed conclusions the reader is referred to subsection 19.

2. Agreements and differences between the conclusions of the FCIC and this study.

The conclusions of the FCIC are in blue, the comments of the present author in black.

1. We conclude this financial crisis was avoidable.

Full agreement.

2. We conclude widespread failures in financial regulation and supervision proved devastating to the stability of the nation's financial markets.

This is expressed too weakly: it proved fatal. "Devastating" is very serious, but not necessarily fatal, deadly. And in this case it was. The financial system could not have degenerated as it did, and the crisis would not have occurred, if the supervisors had operated in accordance with their duty and self proclaimed missions.

The FCIC should have said what it meant, and should have used the same words for the same meanings.

3. We conclude dramatic failures of corporate governance and risk management at many systemically important financial institutions were a key cause of this crisis.

It is obvious that the crisis would not have occurred if the financial institutions (in the narrow sense) had only taken bearable risks. But apart from capital requirements, governments or supervisors have not formulated norms for risks or risk management. The conduct of the banks is not more reproachable than for example the failure to set norms or increase liability and punishability by governments, and the refusal to discuss the question of the greatest admissible risk by the FCIC.

4. We conclude a combination of excessive borrowing, risky investments, and lack of transparency put the financial system on a collision course with crisis.

The metaphor "put on a collision course" is even less clear than "devastating" and "key cause".³³⁶ But it is clear that less loans would have been sold if less money had been available, and that there would have been less subprime if less risk had been taken. Whether more transparency (alone) would have helped is doubtful: governments and supervisors also ignored the facts and warnings which were available.³³⁷ They even eliminated messengers!

5. We conclude [that] the government was ill prepared for the crisis, and its inconsistent response added to the uncertainty and panic in the financial markets.

This is the only place where the government is mentioned explicitly in the conclusions. The conclusion is agreed with. Although it is incomplete, and in an important respect. By actions and omissions governments have facilitated or promoted developments which implied that risks would grow beyond control. Especially by:

- risk increasing liability and criminal law;
- regulation of hierarchical organizations;
- deregulation;

³³⁶ Use of metaphors should be forbidden in conclusions and recommendations of reports of commissions like the FCIC. The text should contain as few ambiguities (including vagaries) as possible.

³³⁷ Examples: The GAO and BIS reports, and the case Gnaizda. For the last see *Inside Job* and the FCIC report. Repression is seen openly in the case of Born, but can be inferred from BIS reports as well. See the BIS Appendix.

- not supervising supervision;
- appointment of dishonorable and incompetent heads of vital organizations;
- mortgage policy (AH en CRA).

6. We conclude there was a systemic breakdown in accountability and ethics.

Agreement. But more in supervision and government (and FCIC) than elsewhere. These were the only ones who failed a legal duty, which they had accepted voluntarily. Only to them the conclusion applies without exception. Among the banks there were those who kept operating responsibly.³³⁸

7. We conclude collapsing mortgage-lending standards and the mortgage securitization pipeline lit and spread the flame of contagion and crisis.

Agreement. But the conclusion is misleading unless it is noted simultaneously that the collapse is the logical and foreseeable result of the affordable housing and CRA policy of the government.

8. We conclude over-the-counter derivatives contributed significantly to this crisis.

Agreement.

9. We conclude the failures of credit rating agencies were essential cogs in the wheel of financial destruction.

The rating agencies may have played an important role in the financial system. The question is whether they could have done differently without committing suicide. There was competition, while there were no norms and no supervision. Knowing the political climate of the times, it is plausible that the rating system had been organized intentionally in such a way that it would not encumber risk taking. The FCIC fails to explain how the rating agencies could and should have acted. The lawgiver has done nothing when the judge decided that rating agencies are not responsible for supposedly incorrect ratings.³³⁹

The following important differences stand out in a comparison of the FCIC conclusions with those of the present book:

1. The FCIC report is mainly descriptive. It only gives (short) analyses within the framework of the descriptions. The FCIC drew the conclusions cited above directly from the report, without prior analysis of the whole.
2. The FCIC gives a picture of the financial system which differs from that in the present study. In the terminology of the present study, the FCIC sees the financial system as a collection of financial institutions in the narrow sense. Government and supervision are not treated as integral part of the financial system.
3. The FCIC doesn't know that the financial economic system is unstable. This is important because awareness and understanding of the instability affects the understanding of the roles of the various factors in the preparation and nature of the crisis. Great disasters need not have great causes. Great disasters can sometimes be prevented by small (fitting!) actions.
4. The FCIC fully ignores the opinion that liability should only be limited under conditions which effectively protect innocent people. Such as effective supervision of compliance with the conditions.
5. Nowhere does the FCIC show that it understands that the situation of competing enterprises resembles a prisoner's dilemma game, and that the enterprises may have an interest in (effective) supervision. (Rather the contrary: its report is hard to understand if it would understand the PD-game).³⁴⁰

³³⁸ As the FCIC shows itself. See the FCIC report or the Dutch notes on the report. In large part, these notes consist of quotes with references. So the file may help non-Dutch readers as well.

³³⁹ Because they are no more than "opinions". FCIC p. 120/148. See also *Inside Job*.

³⁴⁰ In agreement with the textbooks Economics.

6. The FCIC has a fundamentally different opinion about the relative importance of the various contributing factors or causes, and of the relative weights of the responsibilities of the various actors.³⁴¹
7. The FCIC fails to conclude that all principal persons had insufficient integrity and competencies. It fails to conclude that the fact that all vital positions were occupied by such people would inevitably lead to disaster. Even if this would apply only to government and supervision.
8. The present inquiry has investigated the behavior of the principal persons before the crisis on the basis of contemporary documents. It concludes that the principal persons had insufficient integrity and competencies. In other words: that they cannot be considered as reliable or even useful experts. They have to be seen as dangerously misleading people. The FCIC on the other hand consults these people as reliable experts even after the crisis. It does not warn against them or against similar people. The FCIC seems to act on the basis of the dogma that these are reliable experts, irrespective of the facts. If one makes such an assumption, one excludes a profusion of explanations.³⁴²
9. The present inquiry concludes that adequate supervision would have (easily)³⁴³ prevented the crisis. The FCIC does not.
10. This study concludes that adequate government would have (easily) prevented the crisis. The FCIC does not. Instead of honorable and competent, governments were dogmatic and repressive. They failed to use common sense.
11. Because it was asked to find the causes of the crisis, the FCIC should have taken a good look at education and science. Are not people in important respects the product of education?

The FCIC formulates its conclusions rather abstractly, imprecisely. In some cases it mentions only phenomena, not causes: (“collapsing...”, “contributed to...” “failures of credit rating agencies”). In spite of its terms of reference. Its conclusions therefore offer very much room for saying that something has been corrected or solved, without eliminating the deeper cause(s), and without preventing repetition.

With minor or unimportant³⁴⁴ changes, the above also applies to the reports of the CDW.

3. Lack of integrity and competence of CDW and FCIC, and its consequences.

The commissions were composed by politicians who were part of, and co-responsible for, the system which generated the crisis. The politicians had obvious and significant interests: to be exculpated or avoid being accused, and/or to be kept out of the limelight. The commission members were selected and appointed by means of procedures closely related to those used for the appointment of the persons who, apart from a quickly “corrected” exception, failed disastrously. The commission members were politician, political advisor, and/or administrator/manager. They are not representative for the populace or science/ academics. They do not come from all layers of hierarchical organizations, but only from the top. They have no demonstrable research competence. They have no reason to believe that the people by whom they were appointed could assess their ability to participate appropriately in an inquiry as proposed (rather the contrary). They do not explain why they can be relied on to do this inquiry properly.

Most commission members were either personally involved in developments related to the origin or development of the crisis, or had worked in an environment to which this applies. They must have had preferences, and/or interests in specific explanations. Something similar probably holds for their

³⁴¹ Even if the FCIC is far from explicit or clear about these responsibilities. The opinion of the FCIC can be attributed to its superficial and deficient analysis.

³⁴² However, the integrity of the principal persons in supervision and government is not put into question, but that of the principal persons of the major financial institutions in the narrow sense is, if only implicitly, by not mentioning good reasons they may have had for their conduct.

³⁴³ The “easily” indicates that they would not have had to turn the world upside down to avoid the crisis. It is plausible that no more than systematic subscribing to the 1994-1999 analyses of the GAO, and as good as possible implementation of its recommendations, would have been sufficient.

³⁴⁴ “Unimportant”= not affecting any of the main conclusions.

staff.³⁴⁵ The composition of the commissions themselves gives reason to doubt the competence and integrity of the commission staffs.³⁴⁶ Many of the staff members of the CDW are called “research staff member”. But a name says nothing about the competencies of the bearer. None of the staff members has a Ph.D.^{347, 348}

Those who composed and appointed the commissions, and the commission members themselves, could and should have known this.³⁴⁹ It attests to false pretensions or an essential lack of integrity and/or self knowledge to accept a job for which one should know that one does not have the necessary qualifications. To accept a job when there is nothing which reliably shows that one will be able to do it properly.

In short: a priori there was no reason to believe in the competence of the inquiry commissions. A posteriori their incompetence is shown by many methodological errors. Possibly the most important is the great weight they attach to interviews. Mostly interviews with persons who can be considered as suspects, or friends or colleagues of suspects. Their utterances are nevertheless rarely or never (explicitly) checked and compared with contemporary evidence. As if the commission members do not understand why utterances of suspects should not play a primary role in any process of truth finding. And this in a situation where it is beyond any doubt that the system managed by the interviewed persons has crashed completely, and caused immense damage for uncountable innocent people.

Without a competently reacting interviewer, interviews give the interviewed the opportunity to exculpate himself and to mislead. The principal persons seized this opportunity with both hands. Essential untruths of the interviewed have not been refuted by the commissions. Important examples are: the denial by Bernanke of the duty of the Fed to contain systemic risk, and the claims of Wellink about his warnings and the unforeseeability of the crisis. The utterances of the interviewed were not compared with their own contemporary reports. More examples will be given later on.

The commissions were asked to discover the causes of the subprime crisis. What they say about bonuses and “compensation” shows that they acknowledge the influence of the given remuneration system on behavior. And therefore the influence of financial consequences of misconduct. The historical facts show that those responsible had little or no reason to fear that inadequate or misconduct would be sanctioned. But the commissions say nothing about this. Neither do they say anything about legal (im)possibilities of proportional and effective sanctions. This shows incompetence and/or lack of integrity. It has serious consequences. For by means of the interviews and the masked reports fatal misconduct has been disguised and concealed. Which hampers or prevents sanctioning of misconduct in such a way as to discourage similar behavior in the future. Wittingly or unwittingly the commissions have made themselves instruments for the prevention of effective measures.

Although the commissions do not exonerate supervisors and governments, they are far too uncritical about their misconduct (and false pretensions). They don’t note that the crisis would not have occurred if supervisors and governments had only done their duty. In the case of the FCIC it is completely obscure what could or should be done to prevent repetition.³⁵⁰ In the case of the CDW it is clear that its recommendations are very insufficient. Both commissions were silent about the continuation in office of principal persons of whom they could and should have concluded that they are both insufficiently competent and honorable for their function.

³⁴⁵ If the experience with other cases is taken as representative of a general situation.

³⁴⁶ And apart from this: why can the commission members be expected to be able to select appropriate staff for their inquiry?

³⁴⁷ Which shows how members of parliament value these education programs.

³⁴⁸ This is not to deny that the staffs have done very much useful work. But the final reports are (very) inadequate. The commissions (CDW and FCIC) have not done what they were asked to do: find the causes. They did not find the causes which have to be eliminated to prevent repetition.

³⁴⁹ For the FCIC see the appendix about the Members of the FCIC; for the CDW see p. 29 of its first report. All members of the CDW were members of parliament. Its staff was composed of members of the staff of parliament, two temporary government employees, and an externally recruited staff member. (Terminology of the CDW report).

³⁵⁰ The FCIC had not been asked to formulate recommendations. But it is clear that their inquiry should help find measures for prevention.

All this can be explained, and only be explained, by a combination of incompetence and lack of integrity.

4. Methodological deficiencies of the CDW and FCIC inquiries and their consequences.

1. The FCIC assumes that telling the story will automatically uncover the causes.³⁵¹
 - a. The assumption is incomplete and/or incorrect because it is impossible to tell the whole story. The whole story is far too extensive. It consists of innumerable sub...substories and details of details etcetera. Selection is inevitable. A selection can only be made responsibly if the causes are known, and/or if it is beyond doubt what is relevant and what is not. But one can only know after completion of the study. The problem can be solved by critical questioning and iteration.³⁵² In this case the most important question is: does the report explain what needs to be explained, and what needs to be explained to find effective measures for prevention? Is the sequence of events logical, given the explanatory information provided by the commission? One should iterate until one gets a picture and a set of explanatory information which enables one to answer all relevant questions. The FCIC didn't do so. It did not note that the supervisors could have prevented the subprime crisis and why they failed to do so. The commission furthermore did not explain why the various governments failed fatally.
 - b. In principle, the assumption gives all attention to actions, and none to omissions. The assumption leads to underexposure of people and organizations who should have acted because it was their duty to act, but didn't. The FCIC story presents supervisors and government as actors. But the attention given to them is very much less than the attention given to the financial system in the narrow sense. The omissions (and misleading actions) do not get the attention they need in order to understand the crisis and to prevent repetition. Analysis and explanation of the dysfunctioning of supervisors and government are completely absent.³⁵³ The report would have given a very different picture if it had been structured according to groups of actors,³⁵⁴ and if both the actions and omissions of a given group had been investigated. And even in the given approach a separate chapter should have been devoted to supervision and government.

The assumption favors supervision and government. It draws disproportionately much attention to the financial system in narrow sense (the banks).

2. The FCIC draws its conclusions from a marginal analysis of its story of the events. Many of the conclusions are formulated metaphorically (see above). The conclusions overlap with those of the present study. But the FCIC presents them incoherently, as a whole that is difficult to understand, or not understandable at all. Which can be explained from the lack of appropriate analysis and a coherent vision of the financial system in the broad sense. But it can also be explained from the wish to belittle or conceal the role of the government.
3. CDW and FCIC give a dominant role to interviews of persons who played a responsible role in the preparation of the crisis. All these people have an interest in an incorrect picture of the history of the crisis.³⁵⁵ The commissions also use the interviews to get information which can also (better!)

³⁵¹ «This report is intended to provide a historical accounting of what brought our financial system and economy to a precipice and to help policy makers and the public better understand how this calamity came to be.» FCIC p. xi/11.

³⁵² Iteration is the repeated execution of a procedure which improves input data, the output of the procedure being used as input for the following execution of the procedure. The procedure is repeated until the results don't change any more. The existence of a single unchanging limit is not general but conditional.

³⁵³ Moreover, the picture the FCIC gives of the affordable housing policy is methodologically inadequate and incompatible with the facts. See the Chronicle and the notes about the FCIC report.

³⁵⁴ As the Irish reports do. See for example *Misjudging risk: causes of the systemic banking crisis in Ireland*, Report of the commission of investigation into the banking sector in Ireland, March 2011. In the dossier.

³⁵⁵ The sections about the subprime crisis in Sloman and in Gamble, Thompson & Peteraf prove that the efforts at misrepresentation were successful. They make no mention of failures of supervision and government.

- be obtained from contemporary documents.³⁵⁶ The reliability of the interviewed is not even discussed.³⁵⁷
4. Not all groups of actors investigated in some depth have been investigated similarly or proportionally. A whole day was spent on Moody's and ratings, but not a day (let alone days) on supervision, and not a day (let alone days) on government (especially Treasury).
 5. Principal persons, heads of organizations, were not interviewed about the (dys)functioning of their organizations, but as material experts: about specific subjects. Cox (SEC), Geithner (NYFed) and Paulson (Treasury) for example were interviewed in connection with shadow banking, and Bernanke and Bair about "too big to fail". Even though more than one subject was discussed with these people. But the (causes of the) dysfunctioning of their organizations was not discussed with them at all.
 6. The present study shows that contemporary documents contain much crucial information, and make interviews largely or completely superfluous. The CDW and FCIC say that they studied very many documents. But they don't say that they have noted significant incompatibilities between contemporary documents and statements of principal persons in commission hearings after the crisis.

Beside methodological incompetence, lack of integrity probably also played a role. Important deficiencies in the FCIC majority report seem only explicable by the influence of other aims than finding causes. Examples are given below. This can at least partly explain why the FCIC could not agree on a single report, and published a majority report and two minority reports. The minority report of Wallison is limited to the role of the government in the disproportional and dangerous growth of the number of poisonous mortgages. Contrary to the majority report, it is mainly based on contemporary documents.

5. The "Intermezzo: images of the Dutch Central Bank": an example of the inadequate approach of the CDW.^{358, 359}

In the first report of the CDW this intermezzo counts six pages. It consists almost entirely of opinions. In general opinions of people heard by the CDW. The images may be based on facts. But otherwise the intermezzo pays no attention to facts and historical documents.

It speaks anthropomorphically about "the bank", as if it is a single person. There is no attention at all for DNB as an organization of more than 1500 employees.³⁶⁰ Furthermore, none of the following questions was investigated by the CDW:

- How did DNB evaluate the financial system and its stability?
- How did it take account of minority opinions? Were they absent, or why did DNB's management decide to present only a single majority view?
- What were the procedures for annual reports, financial stability reports and other advisory documents?
- Were there no serious differences of opinion within DNB about required actions or policy changes? If such differences existed, what were they? What were the arguments for the actual policy/ actions/ inactions?
- Did nobody see serious risks or dangers that required serious action? What were the

³⁵⁶ This observation is the more amazing because of the assertions of the commissions that they studied an uncountable number of pages of source documents. See the first sentence of chapter 1 of the FCIC report, p. 3/31. For the CDW see p. 31 of its first report.

³⁵⁷ A rather ridiculous but serious example concerning the CDW can be found on p. 145 of its first report. Where after a quotation of Wellink in the hearings the commission asserts (without any check): «So DNB did warn publicly for the risks...». In fact what Wellink said was either very misleading or untrue.

³⁵⁸ INTERMEZZO: BEELDEN OVER DE NEDERLANDSCHE BANK, first report of the CDW pp. 169-75/165-71.

³⁵⁹ An example of (important) misunderstanding is given on p. 71/67 of the first report of the CDW: «A large part of the claims of banks consists of mortgages. As already mentioned in chapter 4, the credit risks of these claims are mostly covered by securitisation.» This is incorrect. Securitisation is no insurance, and doesn't really reduce risks. (It may transfer them). Note that the CDW mentions a publication of DNB of 2009 as its source.

³⁶⁰ In fact, the CDW says nothing that could give an idea of the size of DNB.

arguments for doing nothing?

And these are only the answerable questions. One cannot expect a meaningful answer for example to the question: why were no scenario's made for the sequences of events following the realization of each of the identified risks? One cannot expect a meaningful answer because all information about DNB (and other supervisors) shows that this was simply outside their field of imagination (and abilities). Even though such scenario's are necessary to see what supervisors have to do in order to keep the financial system sound and safe.

Maybe the CDW didn't ask any of these and similar questions because it was afraid to get untrue or otherwise unacceptable answers.

And last but not least: why didn't CDW (or FCIC) interview employees from outside the management?

6. The commissions don't eliminate the ambiguity of the concept "cause". They don't check completeness.

Subsection 7B1.2 discussed the concept of "cause". It explained its ambiguity, and noted that it is impossible and useless to look for causes in the abstract. It showed how the ambiguity can be eliminated when one tries to learn lessons from experience, and tries to avoid repetition of unwanted phenomena. The most important conclusions were, that an inquiry aimed at prevention of repetition of an avoidable disaster should look for man-made, changeable causes. It should check that the set of causes discovered explains the observed phenomena, and offers sufficient handles for changes that make repetition impossible (or at least implausible).

The FCIC was asked "to examine the causes of the current financial and economic crisis in the United States." It doesn't say what it understands a "cause" to be. Several formulations in the chapter *Conclusions* of the FCIC report suggest that the commission didn't really know how to go about the concept. The commission calls observed phenomena "avoidable", "proved devastating", "key cause", "put the financial system on a collision course with crisis", "[...] was ill prepared for the crisis", "added to the uncertainty and panic", "there was a systemic breakdown". She seems to beat about the bush. Obviously lots of things were deficient or wrong, and it is useful that the FCIC notes that. But what about the causes? They are not identified and enumerated. The FCIC doesn't tell us which causes can or should be eliminated to prevent similar crises in the future. Even though it is clear that the inquiry by the FCIC has a practical purpose: prevention of repetition of similar crises. But the FCIC does not use this purpose as a guide in its work, or as a criterion, to eliminate arbitrariness in the identification of causes.

For the misconduct in banking institutions, the FCIC mentions greed as principal or only cause. The causes of the failures of supervisors and government are 1) presumably supposed to be less important; 2) not investigated. The FCIC does not notice that its report shows that in a certain sense, the causes of the crisis can be brought under a single common denominator. Namely that of "false pretensions" of the heads of all organizations constituting the financial system: banks, rating institutions, supervisors, and government. False pretensions about both their integrity and (other) competences. The omnipresence of false pretensions can be seen as a consequence of the systematic selection of people with false pretensions for top management functions. As a consequence of co-optation by similar people.

Like the FCIC, the CDW doesn't ask itself the question about the level of abstraction of causes. The commissions don't seem to be aware of the ambiguity and the need to make a choice. At no level do they give a complete and unambiguous explanation. They ask themselves too few questions. They don't look for changeable causes, at least not systematically. They don't ask themselves questions of completeness. Like: "Do these causes explain the crisis and the phenomena inextricably bound up with it?", "Is a similar crisis impossible if these recommendations are implemented?"

The dysfunctioning of supervision can be said to be a cause, but as long as the causes of this dysfunctioning are not understood it is unclear what measures are necessary and sufficient to prevent it. For this reason it would have been wiser if the FCIC had tried to formulate proposals for correction or improvement, and if both commissions had tested their proposals as regards plausibility and effectiveness by means of thought experiments and the newly gained insights. The proposals should be able to withstand criticism. It should be plausible that implementation of the proposals makes similar

crises impossible or very improbable. This approach forces an inquiry commission to look much more critical for and at causes.

To be useful for prevention, the inquiry commissions should anyway have looked for changeable causes, and checked that it is credible that their elimination or suitable change will prevent new crises.

7. The inquiry of the FCIC has important gaps, serving specific interests.

The FCIC pays a lot of attention to the operation of the financial system in the narrow sense. It pays much less attention to the operation of the supervisors, and even less to that of the government (or Treasury). This is incompatible with the well-balanced treatment which is promised on pp. xi and xii of its report. There the commission suggests something which isn't true, without formally speaking untruth. For it is true that the report has something to say about all topics mentioned. But some topics get much more attention than others, and similar topics are treated rather differently. The influence of HUD on the GSEs is hardly studied or not at all. The FCIC notes that the supervisors have failed. But the supervisors have not been questioned about their annual reports and the (internal) operation of their organization. The commission does not try to explain their dysfunctioning. If the absence of supervision of the supervisors by administration or Congress is noted at all, it certainly isn't analyzed and explained.

The FCIC failed to evaluate the operation of the Presidents Working Group.³⁶¹ It has questioned members like Cox and Greenspan, but not about this.

The FCIC wipes the floor with the rating agencies and the risk management of the banks. But the disastrous (absent) risk management of the government is not even noted. Did HUD estimate the risks of its affordable housing policies in a way that could serve as an example for rating agencies and banks? The FCIC doesn't say a single word about it. And of course, the facts have given the lie to this supposition.

Contrary to the CDW (and the Irish investigators) the FCIC pays no attention to (external) auditors and accountancy firms like Deloitte, Ernst & Young, KPMG, and PricewaterhouseCoopers. It does not investigate the role they played in the risk taking, in the accounting tricks to increase leverage and in the creation of transparency (or opacity) for supervisors and shareholders. In this connection the SEC "Form 10K" could (or should) have been evaluated too.³⁶²

It follows that the FCIC has only partly done its primary job: finding the causes of the crisis. Due to the omissions mentioned above, the causes of the dysfunctioning of government and supervisors remain hidden. Perhaps this was intentional. Or maybe the FCIC didn't find this important because it thought this has little to do with the causes of the crisis. (Which would be incompatible with its conclusions). Anyway the FCIC doesn't account for these omissions or opinions.

The gap precludes measures that could prevent repetition. For it is not sufficient to say that supervision should be corrected or improved without specification of what is needed, and without adequate periodic verification (i.e. supervision). The more so if one concludes that the management of the supervisors lacked the necessary integrity and competencies.

So the FCIC did its job by halves. Causes of important, possibly fatal, dysfunctioning were left covered. Since supervisors have a crucial function in the financial system it is therefore rather improbable that the FCIC report is a suitable basis for the formulation of a sufficient set of measures.

The political establishment failed decisively. The omission of the FCIC serves its interests. A clear exposition of its failure would undermine its power, and even the constitution.

8. Neither CDW nor FCIC tries to find causes of observed general misconduct.

From the histories presented by the inquiry commissions (as from the Chronicle) it can be concluded that all supervisors and governments systematically took wrong decisions with respect to

³⁶¹ Remember the answers to the GAO request for comment on their draft LTCM report. The answers claim that the PWG does all that is necessary. See the Chronicle, under 1999. Formally and theoretically the PWG could have been sufficient, but in practice it evidently wasn't. The "theoretically" means to indicate that the formal duties required a lot of constructive working-out and implementation.

³⁶² When completed, "Form 10K" is a kind of bare financial annual report.

the financial system.³⁶³ They did not do their duty. This had extremely harmful consequences for the people whose interests they were bound to protect. The commissions establish this phenomenon only implicitly. They don't conclude it explicitly. They seem to leave it up to the reader to draw this conclusion from what they do write. Since the phenomenon is not mentioned, it isn't analyzed either, and its causes are not looked for. In particular, the commissions don't ask themselves:

1. How it is to be explained that the dysfunctioning of responsible organizations can be a systematic phenomenon, and that no alarm-bell ever rang audibly anywhere;
2. How dysfunctioning can be corrected if the causes have not been established. This applies to government and supervision, but also to the rating agencies;³⁶⁴
3. Whether the people or organizations who have to devise, elaborate and implement measures are able and willing to do this appropriately.³⁶⁵ This needs investigation and/or substantiation and explanation, because all government organizations concerned have failed for a long time. If their ability and integrity cannot be proven credibly, they should be "renovated" first.

If the very good reports of the GAO of 1994 and 1999 were totally ignored, why not the reports of the CDW and FCIC? And indeed, the US Congress did not wait for the FCIC report to introduce new legislation. After more than a decade of laissez faire and passively looking on, there suddenly was an immediate need for new regulation, even before a foundation had been laid. One cannot reasonably expect organizations or a system that has been proven to be unable and/or unwilling to correct itself for at least about 15 years to suddenly operate properly. That is: fundamentally different.

9. The commissions ignore important facts, with fatal consequences for their conclusions.

Especially the FCIC has shown the systematic failure of the principal persons and organizations. But the character and depth of the failure have hardly been investigated or analyzed, if at all. Where "character of the failure" also refers to the failure of the management of organizations, the operation of organizations as organization, and the effect of codes of conduct and similar codes (or the absence of an effect). There was not just a single "mistake": the underestimation of the systemic risk. Very many errors were made, and not all errors concerned economics or finance. And not all misconduct can be characterized "error".

Nothing shows the depth of the errors more clearly than the annual reports of the supervisors. They show not only their dysfunctioning on a wide front, and their lack of integrity, but indirectly also the failure of the responsible government officials. These could and should have seen the inadequacy of the annual reports, and done something about it.

Please mark well: It is not alleged that the supervisors did everything wrong, and did no good, or that every supervisor employee dysfunctions. The problem is that a dike is as strong as its weakest part. And that this comparison is valid for quite a few human activities. So however good parts of the dikes are, as long as they are not uniformly sufficiently strong, much or most energy may be wasted.

As it is, in the annual reports the supervisors gave a far too rosy picture of themselves and the state of the financial system. Their reassurances were simply misleading, and may have invited more risk taking. The complacency radiated by the supervisors had no basis in reality.

Of crucial importance in this connection are the GAO reports of 1994 and 1999, and somewhat less the qualitatively inferior but still alarming reports of BIS-CGFS of 2003 and later. The FCIC writes that the first mentioned report was removed from the political table under pressure from lobbies. But it does not note that the reports gave well substantiated and clear warnings. It does not investigate what the Fed and other supervisors did with the reports. It does not investigate why not only politicians but the supervisors too threw them in the waste-paper basket. And if they met a better fate, why that

³⁶³ Systematically, during more than a decade.

³⁶⁴ The rating is an example of incomplete and therefore inadequate analysis, and doubtful measures. The problem of forecasting, the fundamental uncertainties of forecasts, and the communication about them, have been ignored completely. They are nevertheless of vital importance for usefulness and use. Improvement of supervision of rating agencies doesn't solve this, and can only improve the situation superficially.

³⁶⁵ By "measures" are meant: the measures intended to prevent repetition of crises.

wasn't noticeable in practice. Anyway, the supervisors should have evaluated the reports on their material merits, and henceforth taken them into account appropriately. Why didn't they do so? Why has the Fed done nothing about systemic risk in spite of these reports? Did nobody in the very large supervising organizations of the USA understand these reports?

Because of the number and quality of the employees of the supervisors this is not credible. Internal signals must have been ignored too.³⁶⁶ That nothing was done with them can only be explained by stupid, authoritarian and repressive management. By management that was arrogantly dogmatic, and unable to make professionally sound judgments. A management that was more of a political agent than professional supervisor, and gave priority to government policy at the cost of its primary mission of ensuring a safe and sound financial system. A management that left no room for opinions incompatible with its own. This may well be the reason why the FCIC doesn't look into the failure of the supervisors. And the reason why it didn't want to hear supervisor employees from outside the top management. They might show that the supervising organizations were run as dictatorships headed by repressive and irresponsible dictators.

The FCIC knows about the GAO reports. But it doesn't use them in its interviews or analyses (which don't go deep anyway, as noted before). The CDW ignores the GAO reports completely. Maybe it doesn't know them. But for an inquiry commission this is not an excuse: it should have found them. For the annual reports neither of the inquiry commissions shows any interest. This cannot have a good reason.

The commissions do not analyze the conduct of the relevant authorities. They do not specify their failings. Even though this is of decisive importance if the commissions' reports are to have the desired effects. Why would the FCIC report have more positive effects than the aforementioned GAO reports? Why would the report of the CDW have more positive effects than the report of 2002 of the commission Vos about the construction fraud?³⁶⁷ In this connection it may be important to note that the reports of the inquiry commissions are submitted to a government division (such as parliament). It is this government division that should do something with the report. In general only a good government has the motive and ability to do something with it. If it doesn't, nobody will do anything, except when it happens to seem profitable from a narrow individual point of view.

As a consequence of the failures of the inquiry commissions noted in this subsection, no improvements are to be expected with respect to the selection of heads of supervising organizations, and with respect to the operation of organizations as organizations.

10. A missing conclusion: for all key functions politicians had appointed inappropriate persons.

The reports of the inquiry commissions show, that none of the heads of the supervising and government organizations which are responsible for the safety and soundness of the financial system has fulfilled his function properly. But the commissions leave this implicit. Nowhere do they make integrity and competence subjects of investigation and analysis. They seem to have assumed tacitly that the principal persons are honorable and competent. That they made "human errors", erred in their judgments, saw no alternative. That they were honorable experts even though more than a decade of history shows that their bragging and dysfunctioning were systematic, and that none of their actions showed understanding of the system for which they bore part of the responsibility.³⁶⁸ And even though its annual reports show that the Fed consciously and systematically ignored its responsibility with respect to systemic risk.

³⁶⁶ As in the other cases, first of all those concerning the Dutch education ministry. Quite a few employees must have been able to produce similar arguments as those of GAO and CGFS. The OFHEO systemic risk report can be interpreted as proof. Even though OFHEO had only about 250 employees, some of them understood the risks, and could hardly have communicated them better. But their report was ignored even by their own management. (Around 2006, the Fed had about 2000 employees, and SEC 3500. Etcetera...).

³⁶⁷ The construction fraud is discussed in chapter 8. Vos was chairperson of a parliamentary inquiry commission.

³⁶⁸ Someone who understood the financial system understood the risks, including systemic risks, and had no reason to complain about the lack of (internal, external?!?) warnings. A principal person should not have remained passive.

One has to conclude that the appointments of the heads of the supervising organizations and the other principal persons were simply wrong. Those who appointed them made terrible errors of judgment.³⁶⁹ In this respect too their integrity and/or competence was a false pretension. For obviously these errors are not incidental. They were never quickly corrected (rather knowingly continued)³⁷⁰. It was a structural phenomenon; uncorrected, and without exception. The structural character is clearly seen in the reaction to the initiative of Brooksley Born of the CFTC. An “error” in the other direction; which was “corrected” as soon as possible.

There are plenty of grounds for the assertion that the crisis was caused by having the wrong people in all key positions in supervision and government. Or equivalently, that the crisis was caused by wrong appointments.

The inquiry commissions and their appointments are examples too. Wallison might be considered an exception (or mistake) if a good remark would mean a good report. Which it doesn’t.

The commissions can be blamed for sticking to the assumption of honorable and competent heads while a mountain of evidence showed the contrary. Professional investigators should at least have considered where dropping the falsified assumption would lead.

11. How the commissions enable the principal persons to retain similar functions.

The inquiry commissions seem to find that many of the principal persons should have behaved themselves differently, and should behave differently in the future. The problem is that the commissions suggest or recommend nothing that gives the principal persons reason to do so. And that they don’t ask themselves whether the principal persons really can behave differently, or are sufficiently honorable and competent.

By a stroke of luck the commissions complement each other nicely for this subject.

The FCIC minimizes the blameworthiness of specific persons or groups.

After the conclusions quoted in subsection 2 above, the FCIC makes the following remark:³⁷¹

«THESE CONCLUSIONS must be viewed in the context of human nature and individual and societal responsibility. First, to pin this crisis on mortal flaws like greed and hubris would be simplistic. It was the failure to account for human weakness that is relevant to this crisis.

Second, we clearly believe the crisis was a result of human mistakes, misjudgments, and misdeeds that resulted in systemic failures for which our nation has paid dearly. As you read this report, you will see that specific firms and individuals acted irresponsibly. Yet a crisis of this magnitude cannot be the work of a few bad actors, and such was not the case here. At the same time, the breadth of this crisis does not mean that “everyone is at fault”; many firms and individuals did not participate in the excesses that spawned disaster.

We do place special responsibility with the public leaders charged with protecting our financial system, those entrusted to run our regulatory agencies, and the chief executives of companies whose failures drove us to crisis. These individuals sought and accepted positions of significant responsibility and obligation. Tone at the top does matter and, in this instance, we were let down. No one said “no.”

But as a nation, we must also accept responsibility for what we permitted to occur. Collectively, but certainly not unanimously, we acquiesced to or embraced a system, a set of policies and actions, that gave rise to our present predicament.»

These paragraphs excel in vagueness, half-heartedness, dubious generalizations and concealment. Clearly the FCIC doesn’t like openness and clarity.

³⁶⁹ Supposing they wanted to appoint a honorable and competent person. They may have had other priorities. Such as loyalty to presidential or partisan policy, or the need to reward a friend with a nice job. Perhaps integrity was the very last thing they wanted!

³⁷⁰ Examples: the appointments of Geithner and Summers by Obama after the crisis.

³⁷¹ FCIC report pp. xxii-xxiii/22-3.

Not everyone concerned had the same “societal responsibility”. With respect to the public, supervision and government had the greatest responsibility. Only they had a legal duty implying societal responsibility, and only they had the corresponding means and authority.

There are more “mortal flaws” than those mentioned. Because of their dominant and dangerous influence, false pretensions should have been mentioned prominently.

Everything that people do wrong can be blamed on (supposed? inevitable?) “human weakness”. In the context of the crisis this is a misleading observation, since not everybody has as many and as serious weaknesses, and because the consequences of weaknesses very much depend on one’s social position. But most of all it is misleading because the responsible positions were voluntarily accepted in spite of weaknesses which are incompatible with societal responsibility. (The initial irresponsibility). And finally, even if everyone had the same weaknesses, they still make one unsuitable for a responsible job.

In the second remark, the FCIC should have been much more explicit about the fact that the crisis has shown that vital pretensions of supervisors, governments and others were false. Not incidentally but systematically. The principal persons claimed abilities they didn’t have. They made assertions which could have been based on a job well done, but were actually based on wishful thinking. The FCIC should have added that false pretensions about one’s abilities do not make part of general human weaknesses. Indeed, people like Bos, Clinton, Greenspan and Wellink had false pretensions that made them fail. But none of the people working in my supermarket has. The formulations of the FCIC majority are much more vague than they need to be, and far too vague to be able to serve as a basis for corrective measures.

It is untrue that a crisis like this cannot be caused by just a few individuals.³⁷² It is the hierarchical political organization of society that makes this possible.³⁷³ It gives a few people so much power that all other people are effectively rendered powerless.³⁷⁴ Perhaps one cannot say that the subprime crisis was caused by less than ten people. But less than ten heads of supervising organizations certainly could have prevented it. They systematically deceived the public, and sabotaged vital democratic processes. For the purpose of correction the FCIC should have noted that the supervision, and the supervision of the supervision by the government, failed their duties and actively contributed to the development of (the size of) the crisis. Also by preventing correction through democratic processes. There are banks which did not contribute to the crisis, but among the supervisors there is no exception.

The third paragraph essentially concludes that the pretensions of all government agencies were false. But the suggestion that it was only a matter of tone and inability to say “no” is worse than misleading. The principal persons should have done much more than say “no” when their duty called for “no”. This kind of conclusions prevents effective measures. The supervisors, Treasury secretaries and the financial leadership of Congress simply misled the public. They actively broadcast nonsense about the safety and soundness of the financial system. They did not have the integrity and competence they claimed to have, and not by far. They could not and did not do what their duty required. They actively and fanatically obstructed efforts of other people to do what was later admitted to be necessary. In fact, the FCIC fails to note that for over a decade, “as a nation” we were systematically deceived by our representatives and elected officials in Congress and Administration. Not only accountability and ethics broke down, but the democratic system as such. The FCIC failed to conclude this, and failed to elicit reparation.

The last paragraph looks far too much like an effort to shift the ultimate blame on the public. It certainly further reduces the responsibility of the principal persons. The paragraph would have been justified if “the nation” had the means to change the “system, [and] a set of policies and actions” in such a way that the crisis would have been averted. Such means are not mentioned by the FCIC. According to the present author they don’t exist. And even if they existed, the structural misinformation would have prevented appropriate correction.

³⁷² Note that the commission gives no proof. It is supposed to be evident. But in modern “democratic constitutional states” heads of government organizations have absolute power in their organization, and play crucial roles in the system. Their incompetence and mutual support can be disastrous, as shown in both the subprime and government debt crisis.

³⁷³ Of course in the absence of effective checks.

³⁷⁴ Power includes the power to manipulate information. The power of appointment was already mentioned.

Since it has been shown implicitly that the political system, and therefore the Constitution, are inadequate, the last paragraph can be read as a call for revolution.

Of course it is misleading to speak anthropomorphically about the nation. According to the Constitution the nation is represented by the president. Because of the Constitution (and the powers it conveys), because of his actions and omissions, and because of his false pretensions, the president is the first to blame. All or almost all other principal persons in government and supervision were appointed or nominated by him.

The Commission De Wit sees irresponsible conduct everywhere, but makes no proposals to stop it.

In the chapter MAIN CONCLUSIONS AND RECOMMENDATIONS the CDW states:

«In its inquiry the commission noted that an appreciable part of those who had responsibilities in the financial system in the run up to the crisis hardly showed a critical look at their own role in the origin of the problems and their failure to prevent them.

The commission finds this lack of self reflection disturbing, because it mortgages the improvements which the commission proposes. It feeds the anxiety that the actors will return to “business as usual”.

In the opinion of the commission it is essential that those responsible for the present problems accept this responsibility and act accordingly.»³⁷⁵

But it makes no recommendations to ensure or increase the probability that they do.

Since no one has accepted responsibility for any serious failure, the first sentence is an understatement. All responsible actors claim that they did what they should and could. Without showing any doubt. Even if they claim a prominent role in the system, they simultaneously shirk their responsibility for the events. An important question seems to be, whether the softness of the commission serves any good purpose. Whether it helps prevention. As the commission itself indicates by the reference to anxiety for a return to “business as usual”, this is quite implausible. The principal persons still occupy vital social positions. Contrary to what happened to most people in the Western countries, the careers and incomes of almost all principal persons were left undisturbed by the crisis.

The commission is not explicit about its reasons for thinking that the responsible persons failed to evaluate their own pre-crisis conduct critically. Isn’t it possible that these persons really didn’t see themselves as responsible for what went wrong, even after thorough self reflection? That the hearings show what they really think? That they (unconsciously?) succeeded in finding an argumentation showing their innocence, at least in their own eyes? And if for some reason this is not plausible, then the commission should have tried to find the cause of the inability or failure of critical self-reflection. For this cause may be closely related to the causes of the false pretensions of the principal persons, and therefore of the causes of the crisis. Couldn’t self-delusion be a characteristic of people who claim (think?) to have competences which in fact they don’t have at all? If such people really could evaluate themselves critically or objectively, they would have done so already a long time ago, and have concluded that they are not suitable for functions in the top management of supervising or government organizations. Unless they are insensitive to the harm they cause for other people, and/or think they have to give absolute priority to I don’t know what. Such as compliance with political wishes which regrettably make victims, but necessarily and unavoidably.

The last sentence of the quote, “In the opinion...”, is an example of irresponsible wishful thinking. How is it possible to believe in fundamental change of the principal persons, given that the inquiry has shown that for many years all of them have acted irresponsibly, and given the lack of reliable self reflection? The more so since none of the recommendations of this commission forces people to act responsibly, or addresses the problem of irresponsible conduct directly. In other words: giving this opinion is the only thing the commission does about the problem. Obviously there is no reason to expect change.

Last but not least the commission nowhere asks the question whether the principal persons can act

³⁷⁵ First report of the CDW p. 4/8.

differently.

Instead of protecting those whom they find responsible, the commissions could and should have concluded that the pretensions of the principal persons were false. That these persons are insufficiently honorable and competent to occupy the kind of positions they occupied in the prehistory of the crisis. They should have mentioned names. Failure to do so means allowing these people to continue to function in top positions, and to remain a serious threat to the safety and soundness of society.

Implicitly the commissions manage to conclude that nobody is guilty. But the commissions do not infer from this that the principal persons and/or their organizations had missions they could not accomplish. And that therefore the missions should be adjusted. And that the system should be reorganized in such a way that (real) people can do what they are requested or supposed to do.

In the reports of both commissions it is assumed that bonuses affect behavior. Quite generally it is assumed that liability and punishability do so. Indeed, it is contrary to logic to deny such an influence. Therefore it is more than probable that shielding people who could and should have prevented the crisis, or could limit the extent of its consequences, prevents reduction of the probability of financial crises and other disasters in the future. Last but not least: their continuance in top management functions precludes their replacement by honorable and competent people.³⁷⁶

12. The FCIC, GSEs and the affordable housing goals.

An important example of a methodological failure is that of the “analysis” of the influence of the affordable housing policy (AH policy) of the US government. The investigation of this influence by the FCIC is hard to explain by incompetence only. It seems easier to explain as an effort to keep up appearances while keeping the AH policy, HUD and presidents in the background, and concentrating the blame for the “poisoning” of the mortgage pool on banking, and the blame for the GSE failure on the GSEs. The incredible analysis of the FCIC majority gave Wallison reason to write a minority report.

In section 9.7 of its report the FCIC majority explains why the AH policy played no significant role in the preparation of the crisis.³⁷⁷ The explanation is inadequately founded, and untenable. Untenable because it is a priori unbelievable that the policy had no influence. The policy was intended to substantially increase homeownership among people with low and moderate incomes. Especially by weakening conditions for obtaining a mortgage.

The crisis of 2007-2008 is sometimes called subprime crisis because it was triggered by subprime mortgages. That is: mortgages with a relatively high risk. Those who deny that the relatively large increase of subprime mortgages was caused by AH policy say that it was caused by greed. Greed undoubtedly played a role. But it did and does always and everywhere. Someone who claims that it caused this crisis has to explain why it didn’t cause crises at other times and places, and in particular why the crisis began (and was caused) in the US, and not in other countries. Such an explanation is wanting. Greed is everywhere; AH policy as described by Wallison (and for example the GSEs) was a US policy. As clearly shown by Wallison and Pinto, the AH policy and the reckless way it was pushed for many years by the successive US governments explains the relatively large increase of subprime.

On the other hand, the analysis supposedly showing that the AH policy had no significant influence is illogical and methodologically erroneous. This is shown in the following.

The FCIC claims that «The [AH]-goals were intended to be only a modest reach beyond the mortgages that the GSEs would normally purchase».³⁷⁸ This is incompatible with

³⁷⁶ Geithner, boss of the New York Fed, became secretary of the Treasury; Bernanke stayed at the Fed, Teulings stayed at the Dutch CPB, Wellink president of the Dutch central bank DNB. He was succeeded by Klaas Knot, participant of inadequate BIS-CGFS conferences, where he seems to have learned nothing that should have consequences for the DNB. For the Dutch ministers Bos, Balkenende, Kok and Zalm similar stories can be told. And these are only examples.

³⁷⁷ The takeover of Fannie and Freddie by the government is described in chapter 17 of the FCIC report.

³⁷⁸ FCIC p. 183/211, first paragraph of new section. The assertion seems to be based on interviews of the FCIC.

- the time series of quantitative goals (from 30 to 57%, see the relevant tables);
- the pressure systematically exerted by HUD to reduce the conditions for mortgages;
- common sense: is the FCIC saying that the policy wasn't needed?

How did the FCIC estimate what the “GSEs would normally purchase”? Because of its incredibility³⁷⁹ the assertion needs thorough substantiation. But this is not given.³⁸⁰

In its hearings in the beginning of 2010 the people questioned by the FCIC frequently say things they could have said years earlier in their annual reports.³⁸¹ But failed to say. The FCIC doesn't make any remark about this. It frequently quotes from the hearings, but never or nearly never from annual reports. In the hearings it is said that the AH goals were goals in a mix of goals. It is only natural that other goals played a role as well. But if the AH goals were no more than one set of goals among many, it is impossible to explain the fact that they were systematically realized very accurately.

The AH policy originated in the department of housing and urban development, HUD. Already long before the FCIC inquiry, there were good reasons to suspect AH policy to be the driving force behind the diminishing quality of mortgages.³⁸² In spite of this, the FCIC uses an employee of HUD as source of information about the effects of AH policy on GSEs. It suggests, implicitly and without argumentation, that this employee is reliable when he defends his own organization and accuses the GSEs:

«The former HUD official Mike Price told the FCIC that while the “GSEs cried bloody murder forever” when it came to the goals, they touted their contribution to increasing homeownership. In addition, Price and other HUD officials told the FCIC that the GSEs never claimed that meeting the goals would leave them in an unsafe or unsound condition.»³⁸³

This very much looks like a 100% misleading half truth (at best). For maybe the GSEs never asserted that “meeting the goals would leave them in an unsafe or unsound condition”.³⁸⁴ But their annual reports explicitly say that higher goals will reduce their expected profits, and increase their risks. The argumentation in the annual reports is correct, and the assertion that the profit goal got priority is not. And why doesn't Price explain why the “GSEs cried bloody murder forever when it came to the goals”? Why did the FCIC not ask for the explanation? The GSEs had good reason to cry bloody murder! The remark obviously contradicts the assertion of a “modest reach”.

In the sequel of the quoted paragraph the FCIC notes that the GSEs had the right to object against AH goals if these would affect their safety and soundness. And that HUD complied with a request for dispensation of... 12/12/07. When the crisis had already started. As if this proves the reasonableness of HUD, and the GSEs are left as the only possible culprits.

The allegation is incorrect because the AH policy of HUD was both reckless and risky. There is no evidence of reflection on risks or “side effects”. Wallison implicitly shows why for a long time the GSEs did not object openly against the goals. The reason was that HUD had created a climate in which cooperation with its AH policy was imperative, and lack of cooperation obstruction of the American dream.

In the meantime the GSEs did give well-argued signals. Just as an illustration a quote from the annual report 2006 of Fannie:

«Our efforts to meet the increased housing goals and subgoals established by HUD for 2007 and future years may reduce our profitability. In order to obtain business that contributes to our housing goals and subgoals, we have made significant adjustments to our mortgage loan sourcing and purchase strategies. These strategies include entering into some purchase and securitization transactions with lower expected economic returns than our typical transactions. We have also relaxed some of our underwriting criteria to obtain goals-qualifying mortgage loans and increased our investments in higher-risk mortgage loan products that are more likely to serve the borrowers targeted by HUD's

³⁷⁹ See the annual reports of the GSEs. The GSE appendix of the present study should be sufficient.

³⁸⁰ Neither in FHFA Note 10-2.

³⁸¹ Note that most of the people questioned had the power to do so.

³⁸² See for example the FCIC minority report of Wallison, and the reports of Pinto. They can be found in the dossier.

³⁸³ FCIC p. 185/213.

³⁸⁴ If only because “unsafe” and “unsound” are not defined measurably, if objectively.

goals and subgoals, which could further increase our credit losses.»³⁸⁵

Similar remarks were made in the annual reports of 2004 and 2005. They seem to have been ignored by HUD and OFHEO. There is at least no evidence of a reaction.

The AH policy can also explain the dysfunctioning of OFHEO. The more so since OFHEO was a part of HUD. Adequate supervision would have meant severe criticism of AH policy. If OFHEO wanted to support government (HUD) policy, it couldn't be independent and critical in any serious sense. In the conclusions of chapter 17, the FCIC majority alleges that OFHEO had to cope with (supposedly) insufficient authority and capacity, and political pressure from the GSEs. The FCIC should have noted that the GSEs could only exert pressure because of the support for the AH policy by HUD and Congress. And it should have explained why lack of authority and capacity justifies misleading annual reports to Congress.

On the other hand the FCIC gives no excuses for the conduct of the GSEs. It does not note that the GSEs contributed very successfully to the realization of the AH goals. If in the opinion of the FCIC the GSEs have taken too much risk, why doesn't the FCIC explain how the GSEs could have realized the AH goals without increasing risks? And did the FCIC ask itself how HUD and Congress would have reacted if the GSEs had resisted the goal hike in 2005?

Finally it should be noted that a thorough investigation would have studied the correspondence between GSEs and OFHEO, GSEs-HUD and OFHEO-HUD, and the minutes of conferences between these organizations.³⁸⁶

The conclusion can only be that the inquiry into the role of the AH policy by the FCIC majority is inadequate. With a lot of difficulty one can blame this on incompetence alone. Since the errors noted above are rather obvious, it seems much more probable that the "analysis" of the influence of the AH policy has to be explained otherwise. To wit: as an effort to stay away from any line of argumentation that would lead to the conclusion that Congress and government were the principal cause of the subprime crisis. Even if this could only be done at the cost of the integrity of the FCIC majority.

13. Supervision failed far worse than shown by the inquiry commissions.

FCIC.

In the subsection *Regulators*³⁸⁷ of chapter 16³⁸⁸ of the FCIC report, selected employees of supervisors are given the opportunity to explain failures of their organizations. The FCIC gives no comment or analysis. In this way they give suspects the opportunity to throw dust in the eyes of listeners and readers.

In the box at the end of the chapter the FCIC concludes:

«COMMISSION CONCLUSIONS ON CHAPTER 16

The Commission concludes that the banking supervisors failed to adequately and proactively identify and police the weaknesses of the banks and thrifts or their poor corporate governance and risk management, often maintaining satisfactory ratings on institutions until just before their collapse. This failure was caused by many factors, including beliefs that regulation was unduly burdensome, that financial institutions were capable of self-regulation, and that regulators should not interfere with activities reported as profitable.

[...]

The Federal Reserve realized far too late the systemic danger inherent in the interconnections of the unregulated over-the-counter (OTC) derivatives market and did not have the information needed to act.»³⁸⁹

³⁸⁵ Fannie Mae, Annual report 2006, p. 27/42. The losses were actually realized...

³⁸⁶ Instead of relying on an interview after the fact with one of the accused.

³⁸⁷ FCIC pp. 307/335 and following.

³⁸⁸ About the months March-August 2008.

³⁸⁹ FCIC-report p. 308/336.

The FCIC says nothing about the decade-long arrogant and complete lack of attention for the system as a system, and for the interactions between its parts and processes. This in spite of the warnings and recommendations of the GAO of 1999. The FCIC says nothing about the systematic misrepresentation of the state of the financial system and the false pretensions in the annual reports, and about the fatal lack of self knowledge demonstrated thereby. Which obviously can be explained by “many factors”, but not by the dogmas mentioned in the quote. Dogmas which were not listed as assumptions in the annual reports. So it was far worse than the FCIC suggests. The FCIC should have evaluated the accounting/ defense of the interviewed employees, if only to prevent misleading unsuspecting readers. It should have critically evaluated the suggestion that the failure should be explained by incorrect convictions, which by the way it fails to qualify as inexcusable for a professional supervisor.

The last sentence of the quote, “[The Federal Reserve...](#)”, is an example of a misleading half truth. Because the annual reports of the Fed show that the Fed ignored systemic risk completely and consciously. It rejected warnings by GAO, OFHEO and CGFS out of hand. The Fed simply did not do anything about one of its four primary duties. Presumably on the basis of an erroneous dogmatic belief of its chairman, his power and his intolerance of any other view. So the “too late” sentence hides facts which are very relevant if one wants to prevent repetition. The FCIC furthermore neglects to mention that the belief and late realization are inexcusable. Not in the last place because of the GAO and BIS reports, and the competencies which should be present in the Fed.

Regrettably the FCIC seems to assume that Greenspan and the Fed are one and the same. It ignores the fact that the Fed has about 1500 employees, and does not try to find out if Greenspan’s opinions reflect the (voluntary) consensus of his staff.

In short: the FCIC gives reasons which it suggests are excusable. It omits facts and analyses which show that the supervisor’s conduct is inexcusable.

The agenda of the hearings and the list of participants of the hearings³⁹⁰ show that only one day was spent with people from only one organization. Moody’s.³⁹¹ On that day the commission even paid serious attention to the internal operation of Moody’s. The disproportional attention to, and criticism of, the ratings cannot be accidental, and cannot be explained by their role in the preparation of the crisis. A much more probable explanation is that the rating agencies were the easiest scapegoat:

- They constituted the smallest subsector (and have less influence in Washington);
- They are not supervised, so that supervisors are not responsible, and the government “only” as the lawmaker.

Why did the FCIC not spend (at least) a similar day on the Fed? This is too inconsistent not to be suspect.

The misleading picture the FCIC gives of the supervisors can be blamed on a combination of lack of integrity and lack of research competence. The FCIC majority report can be explained if it is assumed that supervision (and government) had to be kept out of the wind, while remaining as credible as possible. Reproaches at the address of the supervisors were inevitable, but their character and seriousness had to be presented in such a way as to leave Congress and Administration, who are responsible for the supervision, unscathed as much as possible.

This also explains why the FCIC does not compare the duties and norms mentioned by the supervisors themselves in their annual reports 1995-2007 with their actual performance, and with its own explanation of the conduct of the supervisors.

CDW.

A similar analysis can be made of the CDW. It is undeniable that the CDW and its staff have done much useful work. But the commission seems to have recoiled from the conclusion of a general unacceptable lack of integrity and competence. The fear of coming too close to this conclusion seems to have had a dominant influence on its analyses. Witness curiously inadequate and misleading

³⁹⁰ See the file *Agenda en deelnemers hearings FCIC.rtf*.

³⁹¹ Warren Buffett was not on the staff of Moody’s, but an important shareholder. The FCIC may have seen him as supervisor. But he surely was very much interested as well.

analyses like the one quoted below. Analyses which exculpate the principal culprits. The same fear can moreover explain why some matters are, and others are not investigated, or only superficially.³⁹² Such as the annual reports of the supervisors and the GAO reports.

In its quasi analyses the CDW gratefully uses the representations of the events which had been given in the hearings. An example:

«The crisis showed that there was a worldwide lack of systemic supervision. That is: supervision directed at identification of risks for the financial system as a whole, and the solution thereof. In part, this is caused by the global character of many systemic risks, while supervision is national. In addition a large part of the activities within the financial system took place outside the reach of law or regulation, which reduced or precluded the possibilities of supervision. It is undeniable that the supervision of the financial system was too preoccupied with the evaluation and assurance of the health of individual institutions (micro-prudential supervision). Where it was assumed that the system would be healthy if the institutions were.

Shortcomings in system supervision could also be seen in the Netherlands. In general DNB, as responsible for systemic supervision, put the systemic risks that it increasingly perceived on the public agenda. Its warnings were either heard insufficiently or didn't convince policymakers and politicians. At the system level the systemic risks identified by DNB did not lead to subsequent action by the supervisor [= DNB itself]. The supervision of DNB was mainly directed at the management of individual institutions (micro-prudential).»³⁹³

This is misleading or plainly wrong in many respects. Examples are:

- Risks for the global financial system may have a national cause. As noted before, small causes can have large effects. Global spreading is possible but not always necessary. Countries may have better or worse supervision, may be more or less vulnerable. See the histories of earlier financial crises, such as the LTCM crisis and regional crises.³⁹⁴
- The suggestion that the global character was a problem (or excuse) for supervision is incorrect. National supervision was responsible for systemic stability. It was free to communicate internationally with other supervisors, and could report and advise freely to whomever it wanted. If it felt so, it could have reported that because of its (essentially) global character, it could not be held responsible for systemic stability. (It didn't).
- If activities threatening financial stability took place outside the reach of law or regulation, the supervisors could and should have reported this problem to the authorities, and should have made recommendations for changes in law and/or regulation. This is no more than part of its duty. They didn't. The clause “which reduced or precluded the possibilities of supervision” is incorrect and misleading.
- In fact, GAO, CFTC, OFHEO and others have warned of deficiencies in law and/or regulation. But the authorities did nothing. DNB never supported the efforts of GAO, CFTC, OFHEO and others.
- The sentence “It is undeniable...” is misleading. It is true that supervisors gave far too little attention to interactions and the operation of the system as a system. If only because these affect the safety and health of individual institutions. The commission should have noted that the supervisors failed even in micro-prudential supervision. It should have noted that it is logically impossible to evaluate the “health” of an individual institution without considering its environment- the system- and making assumptions about that. The more so if parts of the financial system are virtually invisible for supervision.
- This was shown in practice by the LTCM case. Everyone responsible, including CDW and FCIC, should have known this. That is what competence means.
- In fact the individual financial institutions were not healthy. (Don't forget the ridiculous (formal, arbitrary) capital requirements).

³⁹² At least in so far as becomes apparent from the reports. It is possible that material that didn't fit the (self imposed) boundary conditions has been left out, as in the case of the FCIC.

³⁹³ CDW1, section 7.5 *Conclusies*, pp. 166-7/ 162-3. After the quote the report goes on with another (sub)topic.

³⁹⁴ See for example the Wiki page Financial crisis. It can be found in the directory Encyclopedia.

- The assumption formulated in the last sentence of the first paragraph of the quote, that the system is healthy if the institutions are, is incompatible with the (untrue) assertion that DNB warned for systemic risks.
- Analysis of its annual reports shows that DNB did note certain risks. But in an inconspicuous way, and without appropriate explanation of consequences and dangers of inaction. It made no proposals for what had to be done. In the end, prior to the crisis it always suggested that an optimistic scenario was the most probable.
- It would be more correct and far less misleading to say that DNB did not warn for systemic risks.³⁹⁵
- CDW omits to note that the supervisors, including the Dutch, did not adequately cooperate internationally, and failed to react properly to signals and threats also in the international context. That not supervision had the priority of the supervisors, but subservience to government policies and fashions.
- CDW ignores the risks of basing its analysis on hearings of prime suspects like Wellink. To say that “**DNB put the systemic risks that it increasingly perceived on the public agenda**” is a ridiculous exaggeration. CDW fails to note that DNB agreed with Greenspan and Geithner that the new (poisoned!) instruments contributed to increasing the resilience of the system.^{396, 397}

CDW clearly did not study the annual reports of DNB. They are not mentioned in the list of documents consulted.³⁹⁸

The last two sentences of the quote are correct. They mean that DNB (and most other financial supervisors) failed fundamentally and disastrously. As underlined by the fact that a majority of Dutch banks needed taxpayers support for survival. But this conclusion is not drawn by the CDW.

14. A missing conclusion: the failure of supervision and government is unthinkable without repressive hierarchical organization.

All principal persons in supervision and government were head of a hierarchical organization. Organizations with at least hundreds and often more than a thousand highly educated employees. As noted earlier, it is unthinkable that none of these thousands of employees has given its managers well substantiated warnings.³⁹⁹ Employees could and should have seen reason for this in their own observations and analyses, reports of similar organizations, and gaps and/or nonsense in annual reports of supervisors and others. If the organizations operated properly as organization,⁴⁰⁰ or if there was an effective whistleblower regulation, then the idiocy⁴⁰¹ could never have lasted so long.

It has to be concluded that all these organizations were (and are) effectively repressive. That they have room only for the convictions and ideas of the top, and no room for meaningful open

³⁹⁵ Or that Wellink was misleading if not lying. The hearings of Wellink seem to be the only source of the CDW for the supposed “warnings”.

³⁹⁶ See DNB AR 2006 section 7.5 pp. 122-3.

³⁹⁷ The curious reader is recommended to search DNB AR 2006 for “systeemris” (= “systemic ris”), and to form an opinion about the “warnings”. Note next that the little you found is reflected only vaguely in the summarizing *Algemeen Overzicht* in the beginning of the annual report, on pp. 17-35. Is it correct to call this “warning”?

³⁹⁸ At the end of the first report of the CDW, on pp. 250-2/246-8. The list mentions only one *Overzicht financiële stabiliteit* in Nederland: that of 2009 (two thousand and nine!).

³⁹⁹ The Irish inquiries confirm this conjecture. See the Irish investigations appendix and below.

⁴⁰⁰ Here too there is coherence. Heads who put their signature under the given annual reports cannot be expected to be able to manage the production of sound reports. (Sound= able to withstand (consistent) criticism).

⁴⁰¹ Some quotes from the SEC Annual report 2006:

«The prosperity of 300 million Americans and six billion people around the world relies on trustworthy U.S. capital markets.»

«The U.S. Securities and Exchange Commission [= SEC] serves you by working to secure the trust in our markets that undergirds our nation’s continuing prosperity in an increasingly global economy. The level of trust in our markets has enormous economic consequences—affecting everything from the affordability of food, clothing, and shelter to the creation of new jobs, increases in wages, and the protection of our retirement security.»

discussions.⁴⁰² Such a (management) culture precludes correction, and is incompatible with effective, let alone optimal performance of the organization.

Repression by the management, combined with a slavish and unthinking attitude of subordinates, makes the observed (seemingly contradictory) phenomena understandable or more understandable. On the other hand the hypothesis of an open culture can only be upheld if it is simultaneously assumed that none of the thousands of employees of supervisors and ministries of finance saw and reported the deficiencies in supervision and the risk of collapse. That is: that their education was inadequate, and/or all of them were stupid and/or failed to do their duty.

The inquiry commissions entirely ignored the organization dimension of supervision and government. They say nothing about the quality of their thousands of employees and about the management of the supervision and government organizations. Or the operation of hierarchical organizations in general.

It follows that the principal persons were not only insufficiently competent as regards finance and economics, but also as regards (practical) management. They were dogmatically authoritarian and repressive (quite coherent properties by the way). As illustrated most clearly by the coordinated elimination of CFTC chairperson Born by persons who for many years in the run up to the crisis occupied the top positions in the financial economic system.⁴⁰³

15. The commissions pay no attention to the influence of liability and criminal law.

The importance of liability and criminal law for decision making has been discussed extensively in the sections 7B.3.4 and 7B.4.3. The present section can be very short because the CDW and FCIC give the subject no attention at all. The FCIC makes several remarks about the “compensation” of employees of financial institutions, and of the sometimes more than hundred million dollars given to departing CEOs. In session 3 of the hearings day devoted to Moody’s, the employees are unanimously of the opinion that liability would have an important and positive effect on the quality of the ratings. Which of course is no more than logical. In their reports, CDW and FCIC nevertheless pay no attention to the influence of liability law on the developments and behavior that caused the crisis. None at all. Why is compensation so much more important than liability?

Similar remarks can be made about the influence of criminal law and punishability.

Of course this is a rather amazing inconsistency. People’s behavior is not only influenced by compensation, but also by liability and criminal law.

16. After the outbreak of the crisis only appearances improved: with another man’s money everyone can solve almost any problem.

The Chronicle shows that the behavior of the principal persons in a rather long period before the crisis, including 1994-2008, was not accountable.⁴⁰⁴ When it became clear that the “theoretical” risks were going to be realized this seemed to change. But the change was more appearance than reality. Actions were taken, and perhaps people tried to do what they could. But their (in)competencies and character remained the same. As a consequence of lack of integrity and competence in the preceding period, necessary information, preparation and plans (scenario’s) were missing. This kind of circumstances helps to explain the inconsequent treatment of Bear and Lehman. A crisis does not suddenly make incompetent persons competent, and does not suddenly provide scenario’s which normally take years to prepare. It is no coincidence that supervision and government allowed Lehman to file for bankruptcy, and failed to apply the only remaining brake on the free fall of the system. The

⁴⁰² A meaningful open discussion is a discussion where everyone is free to say what (s)he thinks fit, where assertions are evaluated on their own merits (consistency, correctness, relevance and similar merits), and where existing ideas etcetera are replaced if the discussion shows that they are untenable. Tenable ideas etcetera are allowed to coexist.

⁴⁰³ And during or after the crisis were appointed in similar positions by president Obama.

⁴⁰⁴ With the (partial) exception of the GAO and many financial institutions, but including all supervisors and central governments.

consequences of the fall of Lehman seem to have been necessary to show the principal persons in supervision and government that the financial system was a coherent whole, and that the system was unstable, and out of control. Only then did they come with thousand and one terribly expensive remedies to save what could be saved.

Inquiry commissions were instituted which were composed of incompetent and unsuitable persons. The commissions were instituted by parliaments which evidently bore at least part of the responsibility for the crisis. In the US new laws for the financial system were introduced before the inquiry had been completed. Whatever was done was led by the same people who in the preceding years had convincingly proven their lack of integrity and competence. Nothing changed in the procedures for the appointment of the heads of the key organizations, and in liability or criminal law. Almost all people in supervision and government who were responsible for inadequate supervision and regulation kept their positions and powers⁴⁰⁵ during and after the crisis.⁴⁰⁶

It follows that their efforts to stop the fall do not show that the authorities are competent. Any fall will stop sooner or later, and with someone else's money and money printers⁴⁰⁷ everyone can solve almost any problem.

17. The interviews and parliamentary inquiries as cover up.

The inquiry commissions have questioned the principal persons about far fewer subjects and much less thoroughly than possible and desirable to find the causes of the crisis and to prevent repetition. The commissions moreover assume that the people they question are reliable: give true and complete answers. They don't discuss the problem of the value of interviews with people with great interests in specific answers and outcomes of the inquiry. In fact, the interviews were not necessary at all. As the Chronicle and the above analyses show, more than enough information could have been found in historical (contemporary) documents.⁴⁰⁸

The FCIC is completely silent about the methodology of the interview as an instrument. The CDW says the following about it:

«The public hearings of the commission had the following goals:

- increasing knowledge and understanding of the subject;
- public testing of findings and conclusions;
- publicly hearing the opinions of the different actors;
- offering the opportunity for public accounting.

The commission notes that the goal of the hearings was not to indict or exculpate persons. Public discussions are not public interrogations (after all it [= this CDW inquiry] is not part of a formal parliamentary investigation) nor sessions of a court, and for that reason not directed at, or suitable for, formal truth finding.»^{409, 410}

The difference between truth and formal truth is not explained. It is moreover necessary to find the whole truth, since half truths may give completely incorrect pictures.

At least the first two goals seem to assume that the people questioned speak the truth. But the (full) truth may be self-accusatory and unacceptable. The truth may be impossible to account for. In other

⁴⁰⁵ In particular their appointment power.

⁴⁰⁶ Such as: Bernanke, Balkenende, Bos, Geithner, Kok, Summers, Wellink, and Zalm.

⁴⁰⁷ To speak with Bernanke. See the remark about the "printing press" in his speech "Deflation: Making Sure "It" Doesn't Happen Here" for the National Economists Club, Washington, D.C., November 21, 2002. See the FCIC report, search for "Deflation".

⁴⁰⁸ In the end the interviews were useful and only useful to demonstrate (or rather confirm) the lack of integrity and competence of the principal persons. Although the commissions failed to conclude this clearly and unambiguously.

⁴⁰⁹ First report of the CDW pp. 32-3/28-9. There also were discussions behind closed doors. For more information see p. 32/28 of the same report.

⁴¹⁰ The original of the last sentence is just as questionable and/or inconsistent as this translation. The word discussion (in Dutch: gesprek) is incorrect: in the hearings the commission members asked questions, and there was at most an incidental semblance of discussion. This applies to the FCIC as well.

words: the consistency or credibility of the above goals is debatable, and the practical conduct of the interviews, and the use of the answers, require more explanation and reflection. Which are not given.

In some cases the problem of the reliability of interviews can be solved wholly or in part by comparison of answers with facts or documents. The present hearings are such a case. But the commissions made no such comparison. They even accepted declarations of ignorance and passivity which should be unacceptable given the responsibilities of the persons being heard. And which is even more unacceptable because these persons were supported by large organizations with many highly educated experts. A fact which is systematically ignored by the commissions.

Neither commission investigated the internal operation of the relevant supervisors or government departments. They did not question the heads of these organizations about it. Even more amazing is the fact that the commissions did not question heads about their own functioning or that of their organization. The commissions only questioned them as experts about specific subjects such as shadow banking or subprime lending. A few times the FCIC asked a head about the operation of his organization. But this happened only ad hoc, in exceptional cases. No head was questioned by either commission about his shameful annual reports.

The inquiries of the CDW and FCIC can have been meant to prevent other inquiries and hamper “similar” publications.⁴¹¹ By claiming the cooperation of all important experts and persons in the financial system, and due to the general abhorrence of (supposedly) double work, an official inquiry precludes other inquiries. In combination with the publicity about them, the large role of interviews means that the people interviewed get the opportunity to suggest that they did what they could and what was humanly speaking possible. And to suggest that it could hardly have been done better. In short: they get the opportunity to mislead the public (“public accounting”). While others are bereft of the opportunity to make investigations that may be necessary to show that these people lack the integrity and competence necessary for their function, and are playacting. That they could and should have prevented the crisis. That not the lack of warnings or authority, or unpredictability were the reasons they could not do otherwise, but their lack of integrity and ability.

The commissions have done little to correct the stories told by those responsible. Mainly by an insufficiently critical attitude and insufficiently thorough analysis. But also by imprecise and euphemistic formulations. The CDW “notes that the goal of the hearings was not to [...] exculpate persons”. But they actually do, namely by “offering the opportunity for public accounting”, without questioning dubious answers and correcting errors and lies. Obviously, the CDW was not trustworthy.

Conclusion. The Chronicle and analyses have shown that the inquiry commissions have systematically ignored essential contemporary information about supervision and government. The overly conspicuous interviews and irresponsible reliance upon these interviews must have helped the principal persons from supervision and government to retain their function or to obtain a similar function. The full truth would have shown their great and fatal lack of integrity and competence. It would have made their positions untenable. Neither commission exposed the half-truths and untruths of interviewed persons, even if misinformation was an essential element of their defense.⁴¹² For these reasons it has to be assumed that shielding responsible persons was an inviolable boundary condition of the inquiries.

18. Support for the hypothesis that a parliamentary inquiry is not meant seriously: eight years after recommendations of an inquiry commission for improvements of accountancy, accountancy turns out to have improved insufficiently or not at all.

Summary and conclusion.

A 2002 Dutch parliamentary inquiry commission made recommendations for accountancy similar to those made after the financial crisis. The evidence of the crisis shows that the earlier recommendations were insufficiently or not implemented. This can be explained by lack of cooperation from

⁴¹¹ Given the subservience and lack of competence of the media.

⁴¹² Which is compatible with their use of interviews as sources of information, and the assumption of reliability of the persons interviewed.

government and the accountants, and unprofessional conduct of parliament. There is no indication of any of this having improved.

In 2002, Dutch parliament instituted an inquiry commission to investigate large scale fraud in the construction sector. The fraud had been brought to light by a whistleblower.⁴¹³ One set of findings of the commission concerned the role of accountancy. This is of interest because the role of accountancy was questioned once again in connection with the subprime crisis.⁴¹⁴ The first quote summarizes the conclusions of the 2002 commission about the accountants:

- «Members of this group knew about forbidden [=illegal] operations;
- They did not take corrective action (even if required by regulation).⁴¹⁵
- There is hardly any indication that they were aware, let alone that they made their clients aware, of the need of a substantial reorientation in doing business in the construction sector, certainly after 1992.»⁴¹⁶

The next quotes are from chapter 8, *Recommendations of the Inquiry commission Construction Sector*, of the report of the commission. They give an impression of the state of affairs in accountancy.

«In the opinion of the inquiry commission the organizations of accountants have to rethink their functioning. They should not put their heads in the sand, but work on points where improvement of performance is possible.

The government has to take the initiative with respect to evaluation and upgrading of regulation. The present operation of the Directive Fraud Reporting is a thorn in the side of the commission. The operation of the private forensic accountants raised questions as well. According to the commission, legal norms for this “extralegal sleuth” are necessary. In the opinion of the commission it is furthermore undesirable that the same accountancy firm does both auditing and forensic jobs for the same client. This requires regulatory measures. The commission is also of the opinion that the government should no longer ask private forensic accountants to make certain investigations, for example regarding serious integrity violations.

The commission recommends appointment of a kind of public prosecutor for accountants. In this regard the commission sees no need to make a distinction in the treatment and guarantees between the two types of accountant, the AA’s and RA’s.⁴¹⁷ The analysis of the shadow administrations shows that both groups have clients in these circles.

In accountancy education more attention should be given to the subjects of fraud and money laundering. The commission points out that this also regards the permanent education of accountants with end responsibility, and especially dilemma training. The analysis of accountancy files shows “damping at the top”: auditing employees are more sensitive to fraud than the partners of accountancy firms.

The commission is very much aware of the fact that its observations regard only a part of the accountants. On the basis of this observation the commission was startled if not frightened by the culture and attitude among accountants. There is need for an inquiry to find out whether this is different in the parts of accountancy serving other sectors of the economy.

In the opinion of the commission the aspects mentioned should be taken along in the framework of current programs like the evaluation of accountancy law, and the discussion about independent supervision and independency. The inquiry commission does not consider it its duty to interfere with these programs. It does however recommend that these programs pay explicit attention to the conclusions of the present inquiry.»⁴¹⁸

⁴¹³ In section 5 of chapter 8 the case is described in some detail.

⁴¹⁴ Also by the Irish inquiry commissions. See below and their reports (in the dossier).

⁴¹⁵ Report Construction fraud, p. 290.

⁴¹⁶ P. 291 of the report (the version with photo’s). (Original and pdf paging agree).

⁴¹⁷ Details such as the precise meaning or specification of AA and RA are irrelevant in the present context.

⁴¹⁸ Construction fraud report (Rapport Bouwfraude) pp. 303-4.

The following is quoted from the list of recommendations on pp. 305-8:

21. «The government should take the initiative with respect to evaluation of the regulation of the functioning of accountants, and improve the regulation where necessary. Certainly where the Directive Fraud Reporting is concerned. But also as regards professional and permanent education. Aspects like fraud, laundering, dilemma training in professional ethics, and interaction with clients should not be absent. The institution of a public prosecutor accountancy should be contemplated.
22. Legal norms for the activities of accountants should be contemplated. Regulation is needed for the combination of auditing and forensic activities for the same client, a combination which according to the commission is undesirable. The government should be more careful in farming out forensic work, for example regarding serious integrity violations. Knowledge and know how in this field should be acquired more often within the government itself.»

The events, and the necessity of a new recommendation, show that these recommendations got insufficient follow up. The new recommendation of the CDW reads as follows:

«Recommendation 27: Improvement duties accountants.

The public accountant of financial institutions may in the first place be expected to check the annual accounts of the institutions adequately. This condition is only satisfied if both shareholders and other users of this financial information can be sure that the numbers give a reliable picture of the institution. It is the opinion of the commission that the financial crisis has shown that the accountancy has failed its social duty, to provide an understandable and sufficient explanation of annual reports of financial institutions, especially the explanation of the uncertainties in the valuation of financial assets.

The commission recommends that the accountants' organization and AFM [= the supervisor of the financial markets] together formulate quality criteria for annual reports of financial institutions. The purpose is that the annual report of a financial institution gives as clear a picture as possible of all relevant circumstances, including risks and uncertainties with respect to continuity. In combination with this, the commission recommends that the accountants' organization and AFM together take measures to bring about that accountants make more frequent use of explanatory sections about uncertain circumstances in financial institutions.⁴¹⁹

The commission supports, and has expectations with regard to, the initiatives taken by the accountants' organization to use the collective knowledge for early notification and monitoring of risks, problems and other points needing attention in financial institutions and the financial sector. With interest the commission has taken cognizance of the proposals of the tripartite consultations new style (the consultations of DNB, the financial institution and the accountant). These initiatives can contribute to restoration of confidence in the accountant as confidential agent in the financial sector and society in general. The commission sees no use in the suggestion to extend the duties of accountants to other duties in the field of corporate governance.»⁴²⁰

Because of the failure of the recommendations of 2002 and the defensive stance of Korf, the representative of the accountants in the financial sector, in the CDW hearings, it is to be expected that not much- if anything- of the recommendations will be implemented.⁴²¹ The need for new recommendations shows that not much was done with similar earlier recommendations in the report about the fraud in the construction sector, and that the accountants did not seriously evaluate and adjust their own role. The implementation of the recommendations of the fraud report seems not to have been

⁴¹⁹ Sic. The commission seems to mean: that accountants more often add explanatory sections, instead of keeping silent.

⁴²⁰ First report of the CDW p. 24/20.

⁴²¹ The attitude of Korf goes a long way in explaining the failure of the earlier recommendations. (Of course, since this attitude is very harmful for society, government and parliament should override him, or ensure that he is liable for his contribution to the causation of crises).

monitored, and parliament has not taken action when nothing was done with them. There is no indication that it will be otherwise this time.

19. Two Irish inquiry reports.

The two reports are:

- The Irish banking crisis regulatory and financial stability policy 2003-2008. A Report to the Minister for Finance by the Governor of the Central Bank. 31 May 2010.
- Misjudging risk: causes of the systemic banking crisis in Ireland. Report of the commission of investigation into the banking sector in Ireland (CIBSI). March 2011.

Summary and conclusions of the report of March 2011.

1. The commission was to find causes, not to make recommendations.⁴²²
2. The report is organized according to type of actors. Its attention is evenly distributed over banks, external auditors and supervisors. The ministry of Finance (DoF) may have got too little attention.
3. (Especially) Chapter 5 and the executive summary are very worthwhile reading. The reason being that this inquiry is remarkably more open than those of CDW and FCIC. It provides (additional) helpful information and views.
4. Contrary to CDW and FCIC, the Irish commission has taken a look inside banks, supervisors and DoF. It also looked at the practical relations between them.
5. The inquiry finds important if not fatal failures in the operation of the hierarchical organizations as organizations.⁴²³ Opinions deviating from that of the leadership are ignored without proper argumentation.
6. Implicitly but not explicitly the report establishes incompetency and lack of integrity of all managements concerned. Without exception they are too optimistic and take too much risk.⁴²⁴ And they fail in management too.
7. The commissions⁴²⁵ note systematically too optimistic/ positive assessments and outlooks of national and international supervisors. Including IMF and OECD.⁴²⁶ It is not noted however that this implies incompetence and lack of integrity. No effort is made to find causes and remedies.
8. The report lends support to the conclusion that hierarchical organization promotes repression: everyone has to follow the leader and accept his views, even if irrational, dangerous, etcetera.
9. The report lends support to the conclusion that strong countervailing forces are necessary to suppress unbearable risk taking and following bad but seemingly profitable examples.⁴²⁷
10. The report notes irrationalism, repression and intolerance, but does not reflect on this.
11. The report does not give solutions for all observed important failures, and does not check whether the remedies mentioned are sufficient to prevent repetition.
12. Its analyses are insufficient as a basis for finding a credible set of solutions.
13. Liability and criminal law are not mentioned.
14. The selection of the heads gets no attention.
15. The financial system is not explicitly considered as a system, and the GAO reports are not mentioned. The report thinks in terms of risks of banks; although these risks are supposed to include system-environmental and market effects.

⁴²² Terms of reference, p. 141/157.

⁴²³ This is the interpretation of the present author of its findings.

⁴²⁴ This includes, but is much worse than, the “Disaster Myopia” listed in the glossary of the report: «A tendency over time to underestimate the probability of low frequency shocks (i.e. “low probability / high impact risks”).»

⁴²⁵ The present commission and that of the earlier report.

⁴²⁶ See paragraph 1.15 in the May 2010 report (quoted in the Irish reports appendix). Paragraph 1.15 presents exactly the same conclusion as drawn above and in the appendices about the supervisors. Except that it is somewhat less outspoken.

⁴²⁷ Unbearable risk taking: unbearable for the risk taker.

Apart from what has been included in the above summary, the report of May 2010 does not give important additional information.

It will be clear that the Irish inquiries are fundamentally different from, and better than, those of the CDW and FCIC. They strongly support the present report. It does not seem to be necessary to spend more time on these reports. It would mainly cause repetition. The question about the explanation of the different character of the Irish inquiries lies outside the scope of this study.

7B.8. The principal persons.

Table of contents of this section.

1. Conclusions about the principal persons.
 - a. Conclusions about the principal persons in supervision and government.
 - b. Conclusions about the principal persons in private corporations.
 - c. Two remarks concerning measures to prevent repetition and other disasters.
2. Introduction.
3. The responsible persons were neither honorable nor competent.
4. The heads of private financial corporations.

1. Conclusions about the principal persons.

By definition, the term “principal person” refers to people who had a function which could and should be fulfilled in relative independence, and who are co-responsible for conditions and events which are contributed to the causes of the financial crises.

Conclusions about the principal persons in supervision and government.

1. Without exception the heads of the organizations in supervision and government which were responsible for the safety and soundness of the financial system falsify history. Their most important line of defense is: nobody could have foreseen this, and nobody has. If true, this would indeed exonerate them. But it isn't. The risk of a crash could have been seen theoretically, even without knowledge of the LTCM mini crash. It had been foreseen and clearly explained by the GAO. Even by the title of a 1999 report the GAO had explicitly advised the supervisors to pay more attention to systemic risk. Those responsible for the safety and soundness of the financial system could and should have recognized and acknowledged the risks, and taken appropriate action. Instead they asserted wrongly and without adequate argumentation that there was no need for interference.
2. The Dutch parliamentary inquiry commission De Wit (CDW) has not refuted the line of defense of supervisors and government officials. The FCIC only in its final conclusions, in an aloof and incomplete manner,⁴²⁸ and without trying to understand why supervisors and government did not see or want to see what the GAO had clearly shown.
3. The inquiry commissions neglected to conclude unambiguously and explicitly that ministers, parliaments and supervisors⁴²⁹ could and should have prevented the crisis.
4. The members of the inquiry commissions were selected and appointed by what can be seen as principal suspects: the parliaments. From their CV's it follows that they had no proven competence for this inquiry. From their acceptance of the job nonetheless, and the absence of reservations in their report, it follows that they lacked necessary integrity.
5. The incorrect representation of the relevant historical facts precludes finding the causes of the irresponsible behavior of supervisors and government. If errors are not noted, one cannot learn from them, and cannot prevent repetition.

⁴²⁸ Without reference to the GAO or other reports (for example the OFHEO systemic risk report of 2003, or BIS reports).

⁴²⁹ Here meaning the heads of the supervising organizations.

6. The persons heard by the inquiry commissions are treated, and behave themselves, as if they were experts. Only rarely do they let shine through that they are or were head of an organization with hundreds or even thousands of employees.
7. None of those questioned by the commissions notes that there may be and were different opinions in his or her organization.⁴³⁰ They all do as if their own opinion is the only (relevant) one.
8. None of the principal persons was and is honorable and competent.
9. None of the organization heads acknowledges substantial failure of himself and/or his organization, and explains the failure.
10. None of them has communicated honestly about his functioning and failure.
11. The principal persons show no trace of modesty.
12. All of them behaved as if they had nothing to fear from malfunctioning.
13. None of the principal persons notes the serious failure of another organization (in supervision or government), and explains its failure.
14. None of the principal persons accounts for his conduct, or gives a trustworthy and acceptable account of his conduct. On the contrary: the principal persons use misleading half-truths and lies⁴³¹ to make everyone believe they did what they could and should, and could not have done better.
15. The impression of integrity and expertise which supervisors and government representatives tried and try to make, is false.
16. It follows that all top positions in the financial system were occupied by insufficiently honorable and competent people.⁴³²
17. It follows that the selection and appointment of the principal persons was inappropriate.
18. The presence of insufficiently honorable and competent people in all top positions in the financial system can be seen as a principal cause of the crisis.
19. The selection and appointment of insufficiently honorable and competent people in all top positions in the financial system can be seen as a principal cause of the crisis.
20. Readers who don't want to exclude the possibility that the principal persons did the good things they possibly did consciously and intentionally, while making their errors unconsciously and unintentionally,⁴³³ should be aware of the fact that the lack of ability to see what has to be done makes a person unsuitable for positions where errors can cause damage which can never be recovered by the responsible person.
21. The principal persons are 100% loyal with respect to each other and their organization. They strongly prefer to blame general facts or circumstances ("nobody could foresee"). If necessary, they blame (general) "human deficiencies", and if inevitable as wide categories of persons as possible ("as society we acquiesced..."). Rarely if ever do they mention deficiencies of specific persons or organizations. Often they praise the people with whom they collaborated. This attitude serves personal and group interests, hinders discovery of causes and prevention, and greatly harms the interests of the population.
22. The principal persons form a closed front against the population.
23. They left their code of conduct, integrity or professional code and/or similar codes a dead letter, showing that the codes are an instrument to mislead the population into thinking that it can rely on their organizations.
24. The principal persons frustrated the inquiries through selective and misleading information.
25. Neither supervisors nor inquiry commissions⁴³⁴ show that they understand the fact that competitors who can profit from activities which increase risks for their environment, and who will be held liable and punishable if risks materialize, benefit from external supervision with sufficient powers to force them to keep potential damages under a bearable maximum.

⁴³⁰ According to the Irish reports there positively were relevant other opinions.

⁴³¹ Including the omission of crucial information or facts.

⁴³² They even didn't listen sufficiently to their advisors, and/or didn't understand them, and/or overruled them for dogmatic and/or "political" reasons, or due to stupidity.

⁴³³ Unintentionally: not for political reasons either, or because Greenspan, Summers or someone else would make difficulties for them if they acted differently etcetera...

⁴³⁴ In fact, no one at all. But those mentioned should, because of their claim of inquiry-competence.

It would seem that the most important conclusions about the top of public administration can be summarized as follows.

The facts of the period 1994-2010 and their analysis show that:

- Almost all principal persons from supervision and government with responsibilities regarding the financial system have demonstrated a fatal lack of integrity and competence;
- They claimed that they did what they could and should, and that “humanly speaking” they could not have done more or better;
- None of them publicly gives any colleague the lie, although their main responsibility is towards the public;
- The inquiries have not resulted in any discharge, liability claims or criminal persecution, or conclusion about guilt.

If it is assumed that the conduct of the principal persons in the years before, during and immediately following the financial crisis is representative for the conduct of all principal persons in public administration, then one can conclude that these people:

- consider self interest and mutual loyalty inviolable norms, and (therefore) far more important than faithful and competent functioning and the interest of the population;
- do not feel accountable towards anyone.⁴³⁵

After an analysis of the financial crisis one can no longer assume that these people inform reliably, fulfill their duties properly, and/or work in the public interest (in the sense of Pareto or *The law of logic*).

Conclusions about the principal persons in private corporations.

1. As regards the subprime crisis, the principal persons in private corporations may not be representative of even the majority of heads of financial institutions in the narrow sense.
2. As regards the subprime crisis, the principal persons of private corporations were heads of a set of financial institutions which strongly affected the operations of all other (financial) institutions, and the financial system as a whole.
3. Like everyone, they could and should have known the (systemic) risk caused by some of their operations.
4. There is no evidence showing that they understood risk and risk management, or any better than supervisors and the responsible government officials.
5. The principal persons in private corporations took unbearable risks. They knew that they caused risks which their corporation would not be able to bear if they materialized. In other words: they didn't verifiably mind even seriously damaging interests of innocent outsiders.
6. They accepted excessively large bonuses and severance packages.
7. They did not give priority to the interests of their employees and shareholders.
8. They seem not to have done much illegal. They were liable nor punishable. None of them ended in jail, or lost a large part of his assets.
9. In other words: the law allowed these people to cause immeasurable damage, which neither they nor their corporations could ever recover. It follows that the law is seriously deficient. The same therefore applies to the makers of these laws: parliaments and administrations.⁴³⁶

Two remarks regarding measures to prevent repetition or other disasters.

The false pretensions of the principal persons have not changed.

The principal persons (implicitly) pretend to have the ability to reason about, and evaluate, financial economic phenomena. In addition they (implicitly) pretend to have the ability to lead and manage an organization with hundreds or thousands of highly educated employees. All of the principal

⁴³⁵ Or are unable to account for their conduct due to lack of self knowledge or the ability to critically evaluate their conduct. That is: not due to unwillingness, but due to inability.

⁴³⁶ And therefore the system by which they were selected/ appointed, and therefore the constitution. Which was made by people selected similarly, and in a similar “parliamentary” process.

persons failed substantially however. The question therefore arises whether there really exist people with both abilities, and to the extent required by the top jobs in supervision and government.

There may have been banks whose leadership had sufficient integrity and competence (and/or luck) to survive without extraordinary taxpayers assistance. This would not however prove either broad and reliable financial economic knowledge and understanding, or impeccable management abilities. Neither can financial economic expertise be proven by the apparent ability to talk about financial economic subjects. In the first place because most of what the top officials say or write is written by employees. In the second place because in general what they say or write cannot be checked reliably. It is not open to the public sceptis and independent criticism necessary to reliably evaluate its soundness, truth or value. And where criticism is seen to be valid, it is often simply ignored. It rarely has the consequences it requires.

In the hearings of the inquiry commissions the principal persons speak with the same self-assurance as they manifested before the crisis. Without showing any doubt. Chronicle and analysis show that before the crisis their speeches and writings were misleading at best, nonsense at worst. The hearings show that there is no reason to assume that in this respect anything has changed. The principal persons seem to have learnt nothing.

Structural human error. Why replacement by similar people won't help.

Logically speaking every changeable cause as defined earlier can be traced back to some kind of human misconduct.⁴³⁷ The relevant kinds of misconduct are identified in the course of this report. In the top of society they are found to be general and structural. They are found to stem from a great and fundamental lack of integrity and competence. This is a major problem since there is no empirical evidence whatsoever showing the feasibility of remedying a serious lack integrity and competence by re-education or otherwise. In other words: it is not reasonable to assume that solution of the problem can be found in correction of the principal persons. The empirical evidence does not allow one to assume that human beings are sufficiently changeable, and can be changed (corrected) as desired. Examples of significant correction should exist, but they don't. So in this report it will not be assumed that the people who were responsible for systematic misconduct can change to such an extent that the risk of similar misconduct in the future is eliminated. This conclusion is contrary to the corresponding assumption of the FCIC. The commission seems to assume that people are free to do what they want. That they can and will change as wanted or required. Upon request. The assumption remains implicit however, and is not discussed.

For the purpose of finding solutions of the repetition problem, this report makes the following assumption. If certain tasks are performed inadequately or worse for a long time, then there are at least three possible explanations:

1. The selection of the responsible actors was inadequate (the selection system must be thoroughly revised);
2. The system of rewards and punishments (the incentive system) is inadequate (and must be thoroughly revised);
3. The tasks exceed human capabilities (the tasks and or their distribution have/has to be revised in such a way that all tasks can be performed appropriately by real (as opposed to theoretical, ideal) people).

And combinations of these.

It cannot be stressed too strongly that it is simply unreasonable to expect fundamental change from people like the principal persons of the financial crisis. Suitable people should be honorable and competent, and (therefore) give priority to the interests of society over their personal interests and those of their likes. For many years the principal persons have shown a fatal lack these qualities. In the hearings of the inquiry commissions CDW and FCIC they did not admit their failings or false pretensions, and did not show understanding of the importance of these failings. They did not

⁴³⁷ Where "misconduct" is assumed to include well-intentioned actions and omissions which cause harm due to over estimation of one's (self) knowledge and abilities. In other words: arrogance. Thinking that one is honorable doesn't make one honorable.

acknowledge that they should have reacted very differently on the recommendations of the GAO of 1999 and the proposal of CFTC's Brooksley Born.

It is just as unreasonable to expect that the problem they created can be solved by replacing them by similar people from the same circles- characterized by false pretensions- or through the existing procedures for selection and appointment, executed by the same kind of people. There is a need for proven integrity and proven competence. This may very well be impossible for say 100,000 of the highest functions in the US. For the simple reason that these functions require competences which exceed human capabilities. "The best possible" may be insufficient, and create unbearable risk. In general a top manager cannot guarantee the safe and sound functioning of his organization. Someone with such a claim only shows a lack of integrity. In general "doing what one can" is insufficient, and may be dangerous for the organization and/or its environment.⁴³⁸

On the basis of the observations and analyses of this and the preceding chapters it has to be concluded that society is dominated by over-ambitious people who are insufficiently aware of, or knowingly ignore, the gap between their pretensions and the abilities required for the function under consideration, and lack the required respect for the population on whose behalf they do their job. They can afford to behave as they do because they know they will:

- At most be called to account by people of the same subculture (that is: people with the same norms and values);
- be allowed to cover errors with fairy-tales;
- never have to recover damages caused by themselves or their organization;
- never be punished (proportionately) for malfunctioning;
- get a nice follow-up job if they have to be sacrificed for the survival of the political establishment.

As long at least as they remain loyal to that establishment.

The list suggests what can or needs to be done to end a leadership that is a danger for society: serious accountability, and consequent liability and punishability. The least obvious may be the need of a reorganization of duties and responsibilities in society. As suggested in the preceding remark, they should be reorganized in such a way that all functions can be fulfilled properly by real people. Permitting impossible functions is asking for problems.

2. Introduction.

As everywhere in this study, the term "principal person" refers to people who had a function which could be fulfilled in relative independence, and who are co-responsible for conditions and events which contributed to the causes of the financial crises. In other words, the term includes all members of parliament, the heads of the relevant organizations, and the members of inquiry commissions.⁴³⁹ Because of practical and formal juridical differences in duties, and because of differences in the kinds of information which can be used to evaluate performance, it is useful to distinguish three categories of principal persons:

- Members of parliament and government;
- Supervisors and heads of organizations with a public function in finance or economics;
- Heads of private corporations.

For the investigation and evaluation of all three categories, use has been made of the factual information collected by the (staffs of the) inquiry commissions, or found in the literature.⁴⁴⁰ Including public reports and statements. For the evaluation of the second category of persons, the annual and other reports of their organization were a principal source of information.⁴⁴¹ The same reports could be used in the evaluation of parliaments and governments.

⁴³⁸ Apart from a very few exceptions, those in power in 1995-2007 did not even do what they could and should have done. Integrity may be the greatest problem.

⁴³⁹ The inquiry commissions because they are responsible for preserving conditions which make repetition possible or probable.

⁴⁴⁰ "Literature" refers to all written texts, including newspapers, and texts on the internet.

⁴⁴¹ Descriptions of the crisis events being the other principal source.

The historical documents have been organized and analyzed. They were compared with the answers the principal persons gave to questions asked by the inquiry commissions. And as regards the members of the inquiry commissions: with the questions they asked and did not ask, and the remarks they made and did not make.

Annual reports consider themselves as the principal documents for reporting and accounting. That is how they are seen here as well. This means that they are also considered as a manifestation of the vision and attitude of the principal person (organization) concerned, and as a sign of what he (it) considers important or not. What is absent is apparently not considered sufficiently important.

For evaluations of some of the principal persons the reader is referred to the appendices. With the understanding that appendices about persons should always be read in combination with those about the organization of which the person was the head.

Not all principal persons have been analyzed as extensively. A choice was made, or rather developed. The choice is not based on consequent application of criteria. It is the result of different time dependent subjective factors, such as personal interest of the author.⁴⁴² After reading some of these appendices, it will be clear that the principal persons are very similar as regards those qualities which are most important for their functioning. The observable qualities are listed in the summary and conclusions above.⁴⁴³ The reader may test the generalization (hypothesis) with the help of the Chronicle and the analyses given in this chapter, and with the documents in the dossier. One may moreover reflect that the hypotheses of the summary make the developments of 1994-2010 understandable, while the hypothesis of integrity and competence of even a minority of the principal persons makes the annual reports, the neglect of the GAO reports, and the crisis a complete mystery. Or even impossible.

If one assumes that the pretensions of the principal persons about their integrity and competence were false, and therefore also their pretensions about their understanding and priorities, then the events are easy to understand. This assumption is in agreement with all empirical evidence, its denial is not. Many documents in the dossier show that none of the principal persons has the slightest idea of the fundamental instabilities of the financial economic system. Nobody is seen to understand the concepts "stable" and "unstable", and the concepts "risk" and "risk management". Someone who understands his field only superficially can only blindly do what he is told, or choose what seems to suit his illusions best. Wishfully thinking that he can manage whatever happens, and/or that everything goes well of its own accord. And relying on friends and power if it does not.

3. The responsible persons were neither honorable nor competent.

A comparison of facts, annual reports and hearings of the inquiry commissions shows that almost none of the responsible people had the integrity and competence required by their function. Their pretensions were false. They only served the public interest with words, not by adequate fulfillment of their duties. They were interested only in appearances. Not in learning and improvement. Even if they professed otherwise.

They did not only lack competence in the quasi-scientific field of their degree, but also as manager. Before the inquiry commissions they acted like individual experts, not as team players, let alone as representative of hundreds or thousands of employees. None of them has been open about the existence of differences of opinion in his organization, and accounted for his management of them.

⁴⁴² Initially the author thought he would have to make a more or less complete collection. In that case the order of study does not matter. But it soon turned out that all these people are essentially the same. They are unreliable too. You don't know what their utterances mean, if anything. So it may even be better not to listen too much to these people. It would anyway be a waste of time to study more than any sample of these people beyond establishing that they are representatives of a rather uniform (and despicable) class.

⁴⁴³ "Observable" as opposed to inferred psychic and/or character qualities. The last will (also) be discussed in the final chapter of this study.

They showed no awareness of uncertainties and alternatives. They saw their own opinion as the only relevant or possible one. None of them acknowledged any form of failure or incompetence.⁴⁴⁴

None of the principal persons admitted that he should have acted differently and how. They did not account for their conduct, but tried to defend themselves, even if in the guise of explanations of causes of the crisis. They made it appear as if they had done what they could and should have done. Showing in this way that they put their personal interest above the interests of the millions of people for whom their function had been called into being. When asked, they will undoubtedly pretend that they respect these people. But their conduct, including that in the hearings, shows the opposite. They don't let themselves be led by a sense of duty and responsibility, but by self interest and false pretensions.

In the wake of the crisis and the inquiries they failed without exception to call those responsible responsible, or to accuse or blame anyone. In other words: the principal persons shielded one another, and thereby seem to form a group which denies accountability with respect to all the other people.⁴⁴⁵

The history of the crisis shows that so called political leaders frequently say things which they don't understand, and of which they see at most part of the consequences. Their statements often seem to be prompted by wishes or dogmas which have not been tested, and which they want neither to have tested nor criticized. They nevertheless want a maximum of support. If "necessary" they try to obtain this support by misleading information or rhetorical propaganda ("The American Dream"). The history of the crisis shows that even in the 21st century it is nonsense to suppose that these wishes or dogmas have a sound basis in terms of for example costs and benefits, and effects and side effects. It was not a matter of "political choices" either. In spite of the appearance of expertise by the use of financial economic terminology and rhetoric, the defense of the crisis-relevant policies was no more than gobbledegook of people who arrogate themselves far more than they can ever prove.

In the preceding section we saw that the inquiry commissions are a representative part of the given political system. A system that seems to have as its overriding goal: the retention of all important political administrative functions for the present occupants and their kindred friends. This would seem to be the only credible explanation of their strange selection of often far too kind questions. The accommodating questioning can already be inferred from a comparison of the facts of the Chronicle and the analyses of this chapter on the one hand, and the hearings on the other. But it becomes shockingly clear if the hearings are compared with the truly critical interviews in *Inside Job*. Which prove the corruptness of the principal persons beyond any doubt. An additional example is Frederic S. Mishkin, who was a member of the Board of Governors of the Fed from 2006-2008. When asked to explain misleading actions, he always starts answering with lies. Somebody who is credulous or sensitive for authority might leave it at that, and stop asking questions. This would explain part of the success of people like Mishkin, because they always seem to give reasonable and even knowledgeable answers to all questions, and in general without hesitation. *Inside Job* had done its homework however. The answers are not believed at face value, and questions are followed through. With the result that Mishkin is shown to have been lying and falsifying information about financial supervision in Iceland, thereby supporting fraud (initially perhaps unwittingly).⁴⁴⁶

Another and perhaps even more shocking example is Glenn Hubbard, dean of Columbia business school, and chief economic advisor of a Bush administration.⁴⁴⁷ He refused to acknowledge that conflicts of interest are incompatible with reliable (and therefore independent) science. He refused to acknowledge that mentioning relevant sidelines and payments in publications are necessary to enable assessment of the publication by the reader. The attitude manifested by such refusals is in full agreement with the analysis in the section Education and sciences above. It makes that analysis more understandable.

⁴⁴⁴ Perhaps Greenspan might be mentioned as an exception. But his incomplete recognition of a theoretical mistake seems to be extremely disproportional to his decade long neglect of systemic risk as chairman of the Fed, and his dishonest frustration of efforts at improvement of supervision by for example Born of the CFTC. As far as the present author knows, he did not acknowledge that he managed the Fed as a dictator, and that in the Fed he did not tolerate any other opinion beside his own. Did he apologize to Born?

⁴⁴⁵ Which is consistent with the hypothesis of a lack of respect for others.

⁴⁴⁶ Note that Mishkin was not one of the worst: he left the Fed board in 2008 instead of completing his term in 2014, and cooperated with *Inside Job*. Which is exceptional.

⁴⁴⁷ *Inside job*, starting around 81' (1h21).

It is of course highly significant that none of the people who are designated “principal persons” in this study was willing to be interviewed for *Inside Job*. This fact supports the above observation of selective questioning by the FCIC, and the hypothesis that they do not want to account for their conduct.

This should be a warning. For risks do not only exist in the fields of finance and economics. Because of the difficulty of many problems facing humanity, and the need of major changes to ensure its survival, integrity and competence, real care and interest are absolutely necessary for prevention of greater disasters than the financial crises. The analysis of the subprime crisis has shown that it was not caused by specific persons or problems, but by the general characteristics of the politicians in power. Honorable people cannot allow people who are a danger for everyone to keep responsible positions. The present politicians do.⁴⁴⁸ If they don’t understand what this means, then they are insufficiently competent. If they do understand, they lack integrity. The conclusion is that not only the laws and policies for financial and economic affairs were made by people lacking the required integrity and competence, but those in other areas as well. This must be considered the key to the solution of many other problems.

4. The heads of private financial corporations, supervision and government.

This subject needs only very simple analysis, and not many words. Many and especially the larger financial institutions took unbearable and irresponsible risks.⁴⁴⁹ CDW and FCIC give numerous examples of lack of understanding of the concept of “risk” in the top of financial institutions:⁴⁵⁰

«Charles Prince, the former chairman and chief executive officer of Citigroup Inc., called the collapse in housing prices “wholly unanticipated.”»⁴⁵¹

«Prince told the FCIC that even in hindsight it was difficult for him to criticize any of his team’s decisions. “If someone had elevated to my level that we were putting on a \$2 trillion balance sheet, \$40 billion of triple-A-rated, zero-risk paper, that would not in any way have excited my attention,” Prince said. “It wouldn’t have been useful for someone to come to me and say, ‘Now, we have got \$2 trillion on the balance sheet of assets. I want to point out to you there is a one in a billion chance that this \$40 billion could go south.’ That would not have been useful information. There is nothing I can do with that, because there is that level of chance on everything.”

In fact, the odds were much higher than that. Even before the mass downgrades of CDOs in late 2007, a triple-A tranche of a CDO had a 1 in 10 chance of being downgraded within 5 years of its original rating.»^{452, 453}

If the inadequate economy education and the widely shared (unnecessary) incomprehension and incompetence are taken into account it seems possible indeed that Prince failed to see that the odds for the 2 trillion were much higher. But this is no excuse.⁴⁵⁴ What he shows in the first place is that he should not have been CEO of a large bank.

In many financial institutions the risk management has failed completely. In spite of supposedly advanced models. It is extremely improbable that the higher management understood the models and the risk management, and could evaluate them. Checks were replaced by blind belief (“trust”). Even

⁴⁴⁸ As noted before, these politicians include the members of the CDW and FCIC.

⁴⁴⁹ Bearable risk may be irresponsible. Example: cooperation with Madoff.

⁴⁵⁰ Supposing these people are not lying.

⁴⁵¹ FCIC p. 3/31. If there is a risk, terminology like “unanticipated” is inappropriate, since it belongs to uniquely deterministic dynamics. Of course, one may wonder whether Prince speaks the truth, or says what he thinks.

⁴⁵² FCIC p. 260/88.

⁴⁵³ A specific example says nothing. But in general the risk certainly was more than 1 in a billion per year. A reversal of the upward trend of home prices within a century was 100% certain. And just as important: there were strong correlations, which put the whole 2 trillion at risk.

⁴⁵⁴ Although I do not exactly know what a banker can and may expect of supervision. A banker makes life difficult for himself by contributing to lobbying which undermines supervision, and makes it unreliable.

more reprehensible is the way some financial institutions treated well founded warnings, and the employees who dared submit them. Even if the employee had the duty to assess the quality and risks of products, and to report his findings. The FCIC gives several examples.⁴⁵⁵ Furthermore:

«Citi did have “clawback” provisions: under narrowly specified circumstances, compensation would have to be returned to the firm. But despite Citigroup’s eventual large losses, no compensation was ever clawed back under this policy. The Corporate Library, which rates firms’ corporate governance, gave Citigroup a C. In early 2007, the Corporate Library would downgrade Citigroup to a D, “reflecting a high degree of governance risk.” Among the issues cited: executive compensation practices that were poorly aligned with shareholder interests.»^{456, 457}

The FCIC gives several examples of incomplete or too late information of shareholder conferences when business took a turn for the worse.

The film *Inside Job* shows that the larger investment banks had a rather extreme decadent culture, without respect for human values. And that Barak Obama gave representatives of these institutions important jobs in his administration, even after the crisis.

The crisis has shown that the incentives, compensation and safeguarding from liability, work one way only: to the advantage of the institution and its higher management, and at the cost of the population outside the institution. There is no counterweight. The motivation of the (extremely) large compensation of the top managers, their “large responsibility”, has turned out to be fake. Their responsibility certainly doesn’t mean negative consequences in the case of malfunctioning. Even after bringing the corporation to or beyond the edge of bankruptcy they are paid amounts of the order of hundreds or thousands average yearly incomes. The supposedly terribly heavy responsibility does not mean the least personal risk.

The institutions in the private financial sector took collective action in the form of lobbying.⁴⁵⁸ According to the FCIC and *Inside Job* the banking lobby was very influential. It systematically obstructed efforts directed at safer rules and supervision. It helped spread the gospel that regulation and risk management could be safely left to the institutions themselves, and that derivatives made the financial system more resilient. The lobbying for such positions cannot be defended on the basis of insufficient knowledge and understanding on the part of the lobbyists or their commissioners. Propositions meant to be translated in binding regulation have to be reliably substantiated. The lobbyists could and should know that their more important propositions had neither empirical nor theoretical basis.⁴⁵⁹ That they (implicitly) claimed expertise shows at least that they lacked integrity.

This negative picture of financial institutions is not entirely representative.⁴⁶⁰ In part it is, because the lobbying took place in the name of the entire sector, and was not corrected by anyone represented. One cannot be a member of an organization involved in lobbying without becoming co-responsible for its positions and actions. Even if only by agreeing with the ways decisions are made. Still, not all financial institutions failed, and not all of them needed a proportional amount of taxpayers money to survive. The misconduct was not general:

«As standards fell, at least one firm opted out: PIMCO, one of the largest investment funds in the country, whose CDO management unit was one of the nation’s largest in 2004. Early in 2005, it announced that it would not manage any new deals, in part because of the deterioration in the credit quality of mortgage-backed securities. “There is an awful lot of moral hazard in the sector,” Scott Simon, a managing director at PIMCO, told the audience at an industry conference in 2005. “You

⁴⁵⁵ FCIC sec. 9.1, p. 157/85 (Countrywide), sec. 9.6 p. 176-8/204-6.

⁴⁵⁶ The Corporate Library LLC (Portland, Maine, USA, 1999-2010) provided independent corporate governance research and analysis. It was founded in 1999. In July 2010 it merged with GMI Ratings. In August 2014 GMI Ratings was acquired by MSCI ESG Research Inc. Further details can be found in the directory USA\Corporate Library.

⁴⁵⁷ FCIC p. 198/226. Note that not a supervisor but a private enterprise draws such a conclusion.

⁴⁵⁸ Note that “collective action” probably is determined by majority decision making.

⁴⁵⁹ The complete absence of knowledge and understanding of the prisoners’ dilemma situation has been noted before.

⁴⁶⁰ Contrary to that for supervision and government.

either take the high road or you don't—we're not going to hurt accounts or damage our reputation for fees." Simon said the rating agencies' methodologies were not sufficiently stringent, particularly because they were being applied to new types of subprime and Alt-A loans with little or no historical performance data.»⁴⁶¹

Whatever one says about the people in this category of principal persons, one should not forget that they worked within the given legal framework and under legally regulated supervision. Some legal action has been taken against some corporations. But there seems to be no legal basis for recovery of the overwhelming part of the damage they have done. It would seem that the financial institutions were not liable in a meaningful sense, and that there was no legal basis for action against any of the principal persons. None of them had to pay fines, or was forced to return bonuses or his severance package. None of them is behind bars, or excluded from public functions.⁴⁶²

The reason can only be that in general the financial institutions and their managers did nothing illegal. And therefore, if causing harm is to be illegal, that the law has to be thoroughly revised. At present it sets no limits on the risk financial (and other) institutions (or people) may take, and/or supposes effective supervision. The formal system assumes that unacceptable risk is precluded by supervision, that supervision guarantees safety and soundness. It assumes perfect regulation and perfect supervision. The risk of imperfect supervision is simply ignored. Even though there is no clear and effective sanction against dysfunctioning. As noted before, the situation is just one of many examples of absence of risk management by governments. Another, related, problem with the formal system is that liability has essentially been abolished for the private financial institutions, but was not shifted to the supervisors. Probably because supervisors can at most recover minor damages they cause. The conclusion is that the system is fundamentally deficient. It assumes perfect functioning supervision, without any provision for malfunctioning. The system is inconsistent: supervision is supposed to be necessary because of the possibility of misconduct in supervised institutions, while that possibility is excluded for supervisors.

The problem might be solved by perfect supervision of the supervisors. But the same people who are responsible for the faulty formal system and laws failed in this respect as well: parliaments and governments even encouraged supervisors to rely on nonsensical self regulation, and thereby fail their duty.

In general, if the law is deficient, then the same applies to the people who made it. Systematic misconduct in any sector of society is impossible without dysfunctioning parliament and government. Fundamental change is inevitable.

The yearly income of the top managers of 134 large corporations in the Netherlands is about 20 times that of the average income of their employees. On 15/6/13 one of the largest Dutch newspapers reported that in 2012 the total income of these managers was increased by 7.5%. The main point in the report is, that these people arrogate themselves a significant increase, while they kept the incomes of their employees unchanged. While the crisis has shown what their "heavy responsibilities" really mean. Permission to grab. Without any obligation to recover damages.

7B.9. Summaries and conclusions.

1. Explanatory summary of the subprime crisis.

The financial system is a collection of institutions, products, services, (vaguely defined) boundary conditions, procedures, and processes. The financial system is unstable. This means that relatively small causes can have relatively large or even extremely large effects. And that as a consequence risks, and the consequences of realization of risks, may be hard to estimate. And that for that reason certain

⁴⁶¹ The conference took place on 9/5/05 or before. FCIC p. 189/217. The FCIC gives several examples. P. 120/148 reports about the decision of bank-CEO Arnold Cattani to leave MBS because his CFO could not give understandable answers to his questions about them.

⁴⁶² On the contrary, as noted before, Obama appointed several of them to important positions. See *Inside Job*.

risks should be prevented or reduced even at high cost. This could and should have been known to all principal persons. Both from experience, reports, and reasoning about the financial-economic system.

But this knowledge was not acted upon. The present inquiry found no evidence showing that any principal person or organization except the GAO and the OFHEO under Falcon was interested in the workings of the financial system as a system, and understood the main mechanisms. The responsible supervisors and ministries showed neither interest nor understanding. Even though understanding and action were absolutely necessary for keeping the financial system and its institutions safe and sound. Or at least to avoid rapid and disastrous developments. Some people understood that some of the information necessary for a more precise evaluation of the stability or risks of the system was missing. But no effort was made to fill the gaps. On the contrary: the dominant supervisors claimed that self interest means self regulation, and that new financial products made the financial system safer. In the years preceding the crisis all supervisors claimed that they could vouch for the safety and soundness of the (ill-defined) part of the system for which they were responsible.

There was no realization of the sequence(s) of events which might follow stagnation or fall of the home prices. Scenario's had been sketched in the GAO report of 1994 and in the systemic risk report of OFHEO of 2003. Much would depend on the specific distribution of the various types of poisoned securities. This distribution was only partly known. And the reports and recommendations of GAO and OFHEO were ignored without sound argumentation. Neither supervisors nor government made contingency plans for the sketched type of scenario.

Mortgage buyers and sellers, and buyers of mortgage backed securities and other derivatives took risks they could not bear (and could only know in part). Important risks, and correlations between them, were strongly and systematically underestimated and/or ignored. Nobody tried to get the information and insight necessary to get reliable estimates of the risks, and to keep them within bearable bounds. Regulation and supervision gave the banks little or no reason to manage their risks in such a way as to avoid causing risk for their environment.

In the course of the years the risks and instability increased. The (relative) amount of money put at risk increased very substantially ("exponentially"). In fact, taking more risk was actively promoted by the US federal government. Its affordable housing policy was directed at increasing home ownership of people with moderate and low incomes. The ministry of Housing and urban development (HUD) dictated the GSEs yearly increasing quantitative goals for the percentage of mortgages sold to people with moderate and low incomes. Reduction of requirements for mortgages was the main instrument employed by the GSEs and other financial institutions for the realization of this goal. The risks increased more or less proportionally with time. Processes in the financial system mixed the "subprime" mortgages in all kinds of securities, making a significant part of assets vulnerable for a downturn in home prices. A downturn which sooner or later was inevitable.

The highest American authorities, including presidents, talked fantastic nonsense about the housing policy. The policy was said to be meant to realize The American Dream. Subservient officials took the words of their leaders as law, as the norm for their work, and let those words replace common sense and professional norms. In this way the authorities initiated the break down of the safety of the financial system.

For more than a decade before the eruption of the subprime crisis, not only the US, but almost all western countries had a policy of deregulation. It was based on the hypothesis that financial institutions have an interest in self-regulation, and that this obviates regulation by outsiders. It was not understood, neither by the institutions, supervision, or governments, that a self regulating group in general needs (will or should) institute supervision. Every lawmaker and true expert could and should have known this. They should have known that in many situations rules and supervision are necessary to optimize the results of the group. But none of them did. Neither did they try to test or check their hypothesis in any way. The deregulation policy must have had a demoralizing influence on the employees of the supervisors and governments. As a consequence, supervision steadily lost its relevance. An increasing part of the financial system became invisible and untouchable for supervision.

Supervisors may have done parts of their duty adequately. It is nevertheless an understatement to say that they failed. It was worse. Apart from very rare exceptions they have shown nothing that resembles understanding or critical thinking about the financial system. Neither did they show understanding of their own role, possibilities and limitations. They prevented necessary actions by others by

reporting that they could be trusted to stand guard over the safety and soundness of the financial system. They said that the system was safe and sound while it was not. They ignored vital parts of their duties. Without publicly accounting for that. They behaved as if they did not understand that exemption of the major part of liability and punishability can at most be justified by effective supervision.

The heads of the supervising organizations were selected and appointed by parliament and government. The crisis has shown that the heads lacked the necessary integrity and abilities. They have not done what they should have done. Parliaments and governments could have known this long before the crisis. They could have concluded it from an evaluation of the annual reports of the supervisors. But they didn't: there was no supervision of the supervisors. Political affinity must have been much more important in the selection and appointment of the heads than integrity and competence. And once in office, keeping silent about risk increasing laws and policies must have been much more important than reliable supervision.

Subprime mortgages in mortgage backed securities and other derivatives became poison when the home prices started to fall. Poisoned securities lost value at a rapidly increasing speed. After a time, nobody wanted them any more, and trade in them came practically to a halt.

It was the market value of securities that counted in book keeping, and determined whether a corporation was solvable.⁴⁶³ In the crisis situation this didn't help. Many financial institutions got liquidity problems, and maybe solvability problems. Important institutions depended on daily extension of loans. Loans which required collateral. Much collateral had lost value. Institutions which could not compensate the loss of value could not remain in business.

These are examples of the mechanisms that make the system unstable. They cause small problems to grow fast and uncontrollably. For numerous institutions the problems became unsolvable. The American dream had become a nightmare.

It slowly dawned upon central banks and governments that maybe more was going on than a temporary disturbance which would blow over in one or two months. In the beginning, when the problems seemed to affect only a few institutions, central banks and governments tried to solve the problem by organizing and supporting take overs by supposedly sound institutions. This was not enough however. For more and more institutions it became increasingly difficult to find the liquidity necessary to remain in business. Because of the risks and the increasing difficulty to cover costs, institutions lost interest in take overs. Only very large amounts of money could prevent a steadily growing number of banks to go bankrupt. In other words: tax payers' money. Important but difficult conditions for the distribution of this money were: minimizing costs for the tax payer and minimizing the benefit for the institutions and persons who had done worst.

Because developments took central banks and governments by surprise and fully unprepared, time posed a major problem. Central banks and governments had no plans or policy, and initially not even tenable ideas. Witness the in consequence of the saving of Bear Stearns and the almost forced bankruptcy of Lehman. The last acting as oil on the fire.

Thanks to the printing press, the financial capabilities of central banks and governments are virtually unlimited. But even unlimited power cannot change the fact that use of these capabilities costs time and has side effects. Time is needed to collect and digest information, understanding problems, developing and testing possible solutions, legal procedures, and obtaining political majorities. The crash itself didn't have such difficulties and obstacles. Delays would probably cost very much money. Therefore there was a fight against the clock too.

The tide was finally turned by the permission of Congress to make enormous amounts of tax payers' money available for supporting financial institutions in difficulties.

Strictly speaking, and in the first instance, there only was a problem with a part of the mortgages, the subprime mortgages. It was not a major problem at that. But through their integration in all kind of securities, and in combination with relatively large uncertainties about new products and processes, the use of which had grown tremendously, the extent of the potential problem had been multiplied

⁴⁶³ The prescription is: "mark to market". On p. 542/570 in the glossary of the FCIC-report one can read: «[mark-to-market: The process by which the reported amount of an asset is adjusted to reflect the market value.](#)»

very many times. Still, the (new) instruments were not intrinsically inadequate. But their value depended on markets and subjective valuation. Subjective valuations can change without good reason; rapidly and without hindrance. Combined with instabilities in the system, changes may cause crashes and crises. Subjective valuations change for 1001 reasons. An important cause of devaluation is the rather sudden general acceptance of the idea that markets (people!) have been too optimistic for too long. The optimism may or may not have had good grounds. Prediction is difficult. What is especially difficult to predict is the turnaround time of unsustainable growth trends in all kinds of prices. Such as the price of money (interest), houses and mortgage backed securities.

One lesson should be that risk management should take account of these possibilities. For if no fundamental changes are made- and in the years 2008-2018 no fundamental changes were made at all- then all of the risks outlined here will be realized again. And if history is a measure, in the 21st century too more than once.

2. Conclusions about the subprime crisis.

(and a few conclusions about both financial crises).

1. By deregulation policy and failure to supervise the supervisors, the central parliaments and governments allowed systemic risks to increase beyond control.
2. Central parliaments and governments are responsible for liability and criminal laws which fail to effectively restrict conduct that creates dangers for outsiders, and fail to ensure full compensation for avoidable man-caused harm.
3. Supervisors did not compensate for the lack of liability and punishability.
4. By its affordable housing policy, the US Congress and Administration caused a steady increase in the risks of mortgages.
5. Well substantiated reports and recommendations of the GAO of 1994-1999 were ignored. Implementation of the recommendations would most probably have prevented the subprime crisis.
6. With one or two incidental ineffective exceptions, supervisors lacked the necessary integrity and competence. They did not understand the financial system as a system, and didn't feel sufficiently responsible. They made themselves an extension of irresponsible government policies.
7. The supervisors nevertheless pretended to be trustworthy and authoritative.
8. All principal persons in government and its agencies were appointed through political processes. With one or two incidental and ineffective exceptions, none of these people turned out to be honorable and competent.
9. Hierarchical organizations can operate as dictatorships. In hierarchical organizations there is no separation of powers.⁴⁶⁴ There is no regulation providing for effective mechanisms for correction of systematic misconduct of the management. Such as preventive punishment of people who violate codes of conduct. Even good whistleblower regulations can at most be half of what is needed. Most attention should not go to whistleblowers but to the misconduct and the failure of the management to correct it.
10. The given whistleblower regulations, codes of conduct and similar codes, had no observable positive effects whatsoever.
11. Whistleblower regulations can only be effective if the regulatory, executive and judicial powers are separated. As it is, they only mislead the public by suggesting that organizations tackle misconduct effectively. (They don't).
12. The principal persons lacked knowledge and understanding which were necessary for adequate fulfillment of their duties. Quite generally there was insufficient knowledge and understanding of:
 - a. The concepts "risk" and "unstable";
 - b. The operation of the financial system as a system (as distinct from the knowledge and understanding of some separate products and services);
 - c. The instability of the system;
 - d. The prisoners' dilemma.
13. In particular, the heads of the supervisory and governmental organizations:
 - a. Did not understand the financial system as a system;

⁴⁶⁴ Reminder: law making, judiciary, and executive.

- b. Did not understand that they and only they could (and should) prevent that system failure would harm innocent people;
 - c. Sometimes were not even seriously interested in the financial system for which they were responsible;⁴⁶⁵
 - d. Pretended that they did understand the system;
 - e. Showed no trace of carefulness, in particular with respect to their own abilities;
 - f. Talked risk increasing nonsense;
 - g. Did not tolerate opinions differing from their own;
 - h. Implicitly pretended to be allowed to behave repressively with respect to subordinates and colleagues;
 - i. Assumed that they would not have to account for their conduct, or suffer consequences of misconduct.
14. If the top of a financial institution in the narrow sense had been competent, it would have lobbied for less permissive regulation, in particular with respect to leverage and risk management. Because this is in the interest of his institution and in the longer term interest of the shareholders.⁴⁶⁶
15. None of the supervisors and other relevant authorities knew how to handle, and communicate about, a future consisting of scenario's with probabilities. They did as if they only needed to take account of the most probable scenario.
16. Even if there had been sufficient knowledge and understanding for making reliable risk estimates, then there were still not enough incentives to actually make them, and to act upon them in such a way as to safeguard innocent people.
17. Several circumstances contributed to cause an enormous growth of the volume of mortgage related securities.
18. The safe and sound operation of the financial economic system gradually became more dependent on the stability of the value of mortgage related securities.
19. The subprime content of mortgage related securities gradually increased.
20. The value of all securities is subjective. It is therefore variable. The variability need not be proportional with objective risks or developments.
21. To a large extent, subjective changes are inestimable. That is: many risks must be considered unknown and in principle unlimited.
22. On the basis of experience it was to be expected that the inclusion of subprime mortgages in mortgage backed securities would cause disproportional value losses when home prices would start to decrease. (It being known that markets always overreact).
23. Due to the importance of MBS and related securities for the financial system, the prices of other securities and other valuations would follow their example.
24. Once a disturbance had brought the system out of its unstable equilibrium, developments outpaced the understanding of the responsible officials. There was insufficient knowledge and preparation for adequate management.
25. In other words: developments ran out of control.
26. However, not the new products were deficient or dangerous, but the fact that their value was subjective, and the fact that markets and important processes depend on subjective valuation. It is the combination of markets with subjective valuation- by people who fear continuation of falling prices- which makes the financial economic system unstable. This is the correspondence with past crises.
27. In the circles of the principal persons, the dysfunctioning and false pretensions were general.
28. None of the (responsible) principal persons has been held liable.
29. None of the (responsible) principal persons has been punished.

⁴⁶⁵ As demonstrated by a dogmatic and irresponsible attitude. Especially when this precludes serious study of relevant information (and therefore checking the operation of their own organization). For example by saying: "I don't read reports; if they contain something important, subordinates will tell me". Without ever checking this, and without proper accounting for the fact that on its way up from bottom to top in an organization, information may get mutilated and misrepresented. Which with a dogmatic head certainly will happen.

⁴⁶⁶ At least with strict or stricter liability and criminal law.

30. Possibly because prosecution can only be started with the support of the political establishment, and because this establishment understands that it could and should have prevented the crisis if it had done its duty. It could not accuse anyone without running the risk of being accused by the accused. Of even greater responsibility.
31. The Dutch and US parliaments instituted inquiry commissions which lacked the necessary integrity and competence. The commissions (or their staff) have collected and digested much useful information. But their analyses are inadequate, especially those regarding supervision, government, and the principal persons and their organizations.
32. Citizens have no possibility to sue dysfunctioning supervisors, members of parliament or the administration for liability, and/or to have them prosecuted under criminal law.
33. None of the circumstances, fundamental legal deficiencies, etcetera, mentioned in this list has changed until at least 2020.
34. Before, during and after the financial crises, the authorities fulfilled no duty with respect to the safety and soundness of the financial economic system with integrity and competence. The crises were nevertheless followed by sizable tax increases and reduction of the services provided for that money. Moreover, the tax increases are equivalent to more power for the politicians. That is: more power to those who failed.

3. Who could and/or should have prevented the subprime crisis.

It is evident that governments could and should have prevented the second financial crisis, the debt crisis. For years they did as if one can systematically spend more money than one receives without creating any problem. A ridiculous and falsified assumption. Which nevertheless is still acted upon.

The following conclusions are drawn from the study of the subprime crisis. Many could just as well have been drawn from the debt crisis. The debt crisis falsifies none of them.

Adequate risk management is understood to be: finding and analyzing risks, and making sure that the sum of the activities does not create unbearable risks, under the assumption of strict liability. The assumption of strict liability may be replaced by another restriction; but some legal (= generally binding) restriction is logically necessary. A well-defined legal restriction is necessary in order to have a "level playing field", equal rules for everyone. Strict liability is necessary if innocent outsiders are to be safeguarded. Without strict liability they are not. As seen after both crises.

1. Adequate risk management by all or substantially more mortgage buyers would have prevented the subprime crisis.
2. Adequate risk management by the financial institutions in the narrow sense would have prevented the subprime crisis. (This would have required strict liability).
3. By doing their duty the supervisors would have prevented the subprime crisis.⁴⁶⁷ Preferably by collectively pointing out that the government needs to take adequate (specified) action. For the communication of this demand they could have used their annual reports. In fact, the preceding points are valid for supervisors as well: adequate risk management by the supervisors would have prevented the subprime crisis. Even though their risk management would look somewhat different from that of banks. But actually they had no risk management at all.
4. By doing their duty, national governments, foremost that of the USA, would have prevented the subprime crisis.⁴⁶⁸ They fatally and blamably failed by:
 - a. Omitting to set limits to risk taking which preclude more than marginal harm for the world outside the financial sector;

⁴⁶⁷ The argument of judge Rothstein showing PricewaterhouseCoopers to be liable with respect to the FDIC/ Colonial Bancgroup is applicable here as well (without any substantial change). The argument shows the supervisors to be liable. The ruling supports the arguments presented in the present work. It shows that in some areas this argument does represent the law. Evidently not in all areas: as asserted before: the law is inconsequent. The ruling can be found in a file with date 20180702. The author is indebted to Reuters for an article about, and reference to, the ruling.

⁴⁶⁸ The previous note about the ruling re PwC-FDIC is applicable here as well.

- b. Retaining risk promoting laws, especially those regarding liability, criminal behavior and hierarchical organization;
- c. Deregulation and weakening supervision, in spite of warnings, the growth of the financial sector, and the introduction and growing use of new risky products. The policies were contrary to common sense and professional know-how;
- d. Dogmatic affordable housing (mortgage) policy, with quantitative 4-year plans that could only be realized by greatly increasing risks and undermining the safety and soundness of the financial system;
- e. Absence (or the wrong kind)⁴⁶⁹ of supervision of the supervisors;
- f. Appointment of people of insufficient integrity and competence in all functions relevant for the safety and soundness of the financial system;
- g. Allowing unrestricted lobbying;
- h. Absence of risk management.

The affordable housing policy of the US government (= Congress + Administration) is the best candidate for the denomination “main cause”. Because of its direct effects, and because it had a corrupting influence on many crucial processes regarding risk taking, safety and soundness.

4. Some general conclusions.

1. The subprime crisis has shown that the members of the parliaments and governments of the countries which were affected by the financial crises, and the heads of the organizations responsible for aspects of the financial economic system, lack the integrity and competence necessary for the adequate fulfillment of their duties.
2. Without significant exceptions. This was the cause of the crises. Not their unpredictability or the supposedly immoral conduct of banks. A competent public authority, the US GAO, had pointed out the danger. Its warning was well substantiated. Every expert should have been able to reproduce its reasoning and acknowledge its validity.
3. There is no reason whatsoever to assume that the lack of integrity or competence only concerns financial economic matters. Indeed, other chapters provide examples in a wide variety of other areas. The common denominator is: false pretensions about integrity and competence.
4. It must be doubted whether these people are able to evaluate candidates for responsible positions reliably. In any case people lacking integrity will not appoint honorable and competent people. Such people would try to eliminate them from positions of power.
5. In the present legal and political circumstances, people who take unbearable risks have insufficient reasons to fear a share in possible negative consequences.⁴⁷⁰ There is no limit to risk taking. As a consequence society and life on earth run unlimited risks. This is a consequence of inadequate laws and the dysfunctioning of parliaments and governments.
6. Hierarchical organizations do not correct themselves. This can be explained by the inadequate regulation of this kind of organization.
7. In combination with the selection of heads with a “positive attitude”, overestimation of personal abilities and underestimation of risks, repression in all hierarchical organizations involved in the subprime crisis precluded any positive effect from common sense and responsible thinking.
8. Codes of conduct and whistleblower regulations had no positive effect at all.
9. All education has serious deficiencies which contributed to the causation of the crisis. Education is insufficiently directed at preparation for the real world. It insufficiently teaches modesty and critical reflection. Sometimes, as in economics, it even teaches to ignore well-founded criticism. It

⁴⁶⁹ That is: making sure that supervision would not restrict the freedom of the financial institutions more than the irresponsible management of these institutions found acceptable. In other words: making sure that supervision was not really effective. The terminology “absent supervision” probably is an understatement. Government actively opposed effective supervision. The annual reports and the FCIC report provides evidence.

⁴⁷⁰ The “political circumstances” include the given occupation of higher functions in society. “Higher functions” are functions with relatively many subordinates and/or relatively much power/ influence.

- does not tell students how they can live in accordance with generally accepted norms and values without hurting themselves.
10. In science (as an activity) not the advancement of explanatory knowledge gets priority, but the personal interests of the scientific establishment. In general at the cost of the advancement of explanatory knowledge. The discussion in and about science as an activity is not open at all. Contributions are not evaluated only on their scientific merits.

There is a striking resemblance between the financial crises and the second world war. In both cases the danger (or risk) was known for many years, and allowed to grow unhampered. It was allowed to grow until it had by far outgrown all means of control. With innumerable victims and immeasurable destruction as a consequence. Afterwards the governments who could and should have prevented the disaster wrote history in such a way as to completely ignore their own complete failure to stop the evil and prepare for its attack. They put all the blame on a foreign evil which definitely played an important causal role, but could have done no major harm if (other) governments had done their duty.

This is consistent with the conclusion that most of the important causes (including the causes by omission) have nothing to do with the financial system, but concern the political system. And with the conclusion that no really effective lessons are learnt.

5. Early warnings by authoritative organizations.

People who are competent to head a ministry of finance or a supervising organization, or pretend to be an expert in finance or economics, should have seen and understood the main (systemic) risks without having to be warned by others. In their defense, many of the principal persons have said that the crisis came as a surprise for everyone. Thereby showing that they lacked crucial knowledge and understanding of the system they were supposed to keep safe and sound. And that they lacked the integrity needed in any responsible position. The denial of warnings being a lie. The warnings have been mentioned before. But because of their importance for the understanding of the crisis and of the responsible people, it may be useful to summarize them concisely.

In 1994, 1996 and 1999 the US Government Accounting Office (GAO) published clear and well substantiated reports with unambiguous warnings against system instability due to derivatives and other financial instruments. It is important to note that the GAO not only gave opinions, but explicitly pointed out mechanisms which constitute risks for the financial system. Everyone with some responsibility for the safe and sound operation of the financial system should have taken the reports to heart, and taken action according to its recommendations.

In January 2003 the Committee on the Global Financial System (CGFS) of the Bank for International Settlements (BIS) published a report *Credit risk transfer*. The report tries to give an understandable overview of the developments in the field of credit risk transfer. It draws attention to many obscurities, and points out many rather vague but potentially large risks. It is one of the very few systematic efforts at understanding the newer part of the financial system. The report mentions the systemic risk of concentration.⁴⁷¹ Implicitly it shows that in conceivable circumstances concentrations- or too much of the wrong types of assets- may cause markets to freeze to a standstill. The report discusses incentive issues. But the style of the report is extremely detached, even though it is written by supervisors. One can hardly speak of warnings. But the lack of logic in what should be a professional report is suspicious, and should alarm everyone interested. The report is simply too inconsistent. Someone who reads it against the background of the GAO reports can only conclude that in the meantime the risks have grown tremendously.

In February 2003 the GSE supervisor OFHEO published a report about GSEs, OFHEO and systemic risks. It sketched a scenario showing the possibility of a system breakdown as a consequence of falling housing prices, and made recommendations to mitigate risks.

⁴⁷¹ For “concentration” see IV.2 (with numbers), and VII.3.

Starting in 2004, Fannie and Freddie yearly drew attention to the risks of reduced mortgage requirements in their annual reports.⁴⁷² In the annual reports of Freddie the development is easy to follow. Realization of the ever higher HUD goals requires easing mortgage requirements, which affects profitability. This is purely logical, but contrary to the assertion of the FCIC that profit is the principal (and inviolable) goal of the GSEs.

In March 2005 there was a *Joint Forum on Credit Risk Transfer* in the BIS-framework. The report of this forum is just as strange and suspicious as the CGFS report of 2003. For an experienced reader it is nevertheless an unambiguous warning. For details see the appendix about the BIS reports.⁴⁷³

The BIS, GAO and OFHEO reports agree on all main points.⁴⁷⁴ The reports and recommendations were nevertheless largely ignored. In the annual reports of the supervisors they are not discussed or even mentioned.⁴⁷⁵ The inconsistencies and obscurities in the BIS reports were no reason for remarks or questions. The neglect is not accounted for. The reactions of the US supervisors on the GAO reports were defective if not shameless, and that of the US government at least as bad. Formally speaking some of these reports and recommendations could be ignored. However, because of the duties of the supervisors, the formal status of the publishing organization is irrelevant. The formal status is only important for people who think they have infallible knowledge and insight, or the power to ignore whatever doesn't suit them. Such people only listen to people with formal authority. They do not (and/or cannot) assess information as an expert, and from the point of view of their duties. The significance they attach to a report is determined only by the position and power of the author or commissioner.⁴⁷⁶ On the other hand, someone who takes his duties seriously and has a minimum of understanding of the financial system, studies every relevant signal, and acts accordingly.

After the crisis responsible authorities like Dutch central bank director Wellink and secretary of the treasury Bos denied that there had been authoritative warnings which required their (re)action. On Thursday, September 2, 2010, Bernanke told the FCIC under oath: «**What I did not recognize was the extent to which the system had flaws and weaknesses in it that were going to amplify the initial shock from subprime and make it into a much bigger crisis**». Something clearly described in both GAO and OFHEO reports. The reports mentioned above amply prove that these people lied.⁴⁷⁷

7B.10. By way of an epilogue: Trying to get Wellink prosecuted for perjury.

In 2016, when most of the present report was completed, it seemed impossible to get it published by a commercial publisher. Everyone of his acquaintances told the author that nobody nowadays is interested in books of more than a few hundred pages. The style moreover is too difficult, and the form too unconventional. Something short and simple might have a better chance. When thinking about a suitable subject, I realized that Nout Wellink, from 1997-2011 president of De Nederlandsche Bank (DNB, the Dutch version of the Fed), might have committed perjury in his hearings by the Dutch parliamentary inquiry commission, the CDW. For the present chapter I had made analyses of some of the hearings of Wellink, and of DNB annual reports. This had resulted in two appendices. I decided to review and supplement the appendices, and to check for violations of an oath to tell the truth, the

⁴⁷² In its AR of 2002 Freddie is still saying explicitly that «**We seek to purchase most single-family and multifamily mortgages in support of affordable housing through our standard mortgage purchase programs and under the same credit standards as our other mortgage purchases**». (On p. 15/24, in the section *Regulation and Governmental Relationships*). In AR 2003 uncertainty becomes noticeable, but the mortgage requirements remain unchanged. AR 2004 declares that the standards have to be lowered in order to realize the goals dictated by HUD.

⁴⁷³ Analysis suggests that there was much more anxiety in the forum than has found explicit expression in the report. At least from the point of view of research into the functioning of people under political pressure it would be very useful to be able to consult the drafts of the report and the minutes of this forum (and its committees).

⁴⁷⁴ This can also be seen in the appendices on these organizations.

⁴⁷⁵ An unforgivable omission. Supervisors should at least have mentioned and summarized them, and account for having done nothing with them. Differences of opinion are permitted, but in the case of authoritative reports on very important topics only when accounted for.

⁴⁷⁶ Note that nothing in this or any other case contradicts this hypothesis.

⁴⁷⁷ Quite apart from the fact that every competent person could have deduced the dangers from his knowledge of the system, just as GAO, OFHEO and CGFS had done.

whole (relevant) truth, and nothing but the truth, to the best of one's knowledge.⁴⁷⁸ It quickly became clear that Wellink never told the whole relevant truth, and lied whenever the truth would unmask him as being incompetent or having malfunctioned. It was not difficult to show that Wellink had committed perjury. But to prove and to prove in a formal juridical sense can be very different things.

In order to give a request for prosecution the best possible chances, I wrote a report presenting important declarations of Wellink in the hearings against the background of the (pre)history of the financial crises and the activities of DNB in that period. The report was meant to be self-sufficient. It has the following chapters:

1. Motivation and overview.
2. Concise history of the subprime crisis and the crisis of government debts.
3. Deeper causes.
4. The hearings of the CDW with Wellink.
5. The perjury and the constitutional state.
6. Dealing with the deeper causes.

Appendix. DNB reports 1998-2007.

Chapters 2, 4 and the appendix present most of the facts. The declarations of Wellink, and the questions of the CDW, can be compared with the facts presented in chapter 2 and with the appendix. The report provides all the information necessary for a reader to convince him- or herself. It also shows that the organizations of public administration established to evaluate and control the organizations of public administration failed in at least 1994-2010. In other words: the report does not only show the lack of integrity and competence of Wellink and DNB, but also that of crucial elements of public administration.

The chapter on deeper causes and chapter 6 are adaptations of similar parts in the present report.

At the internet I saw quite a few people accusing Wellink of perjury. But none of them made a serious effort to specify or prove it.

I had found out that any citizen can report a crime to the public prosecutor, and request prosecution. I had been told that in case of rejection of the request, the citizen can ask a court of appeal to order prosecution. So I sent the chief public prosecutor for the juridical region The Hague a copy of the report,⁴⁷⁹ and a letter requesting prosecution of Wellink for perjury.⁴⁸⁰ For proof the letter refers to the report. After two weeks, the chief prosecutor replied that Wellink had not lied on purpose, and that he would not prosecute him. He said that I could appeal to the court of appeal in The Hague. The letter gave no proof or arguments whatsoever, so I sent a letter asking substantiation. The chief prosecutor replied that he stuck to his argument showing that there was no perjury. Even though no argument was given. He had shown nothing. Both of the prosecutor's letters show more "errors" than this one. In fact, they seem to be written so carelessly as if nobody would ever have to answer for them. It would however be a waste of time to discuss them any further.⁴⁸¹ The conclusion being clear: a Dutch public prosecutor is free to act arbitrarily and irresponsibly. He need not give any argument showing he made a well-considered decision. He need not treat similar cases similarly.

The arbitrariness or malicious bias is underlined by declarations of the attorney-general, a high level public prosecutor, in a trial against former town councilor Van Rey on 14 November 2017. Van Rey was accused of corruption. Among other things, the attorney-general said:

«A corrupt civil servant signifies that public administration works better or faster for those who can pay for it. The citizen sees that public administration does not abide by the law, while especially public administration should give the good example: every citizen has the same possibilities and

⁴⁷⁸ This is the contents of the oath required by the US Financial Crisis Inquiry Commission (FCIC). The Dutch oath is less explicit.

⁴⁷⁹ This is where the perjury took place, and where I live.

⁴⁸⁰ The letter is dated 22 August 2017.

⁴⁸¹ The letters are appended to the (updated) Wellink report: rechtvandelogica.net/WM.pdf

everyone is treated equally. Especially the civil servant should stick to the rules. Public administration operates by the grace of the confidence of citizens in the objectivity of civil servants. Corruption undermines this confidence, and corrodes the foundation of the constitutional state. [...]

With the criminal prosecution of violations of integrity and official corruption, the office of the public prosecutor wants to firmly support all initiatives taken by the government to counter violations of integrity and official corruption. [...]

As town councilor Van Rey's conduct should be exemplary. Especially people like him cannot be honorable only partially. [...]

The essence of the case is not the financial benefit of Van Rey and [businessman] Van Pol, but the lack of integrity of Van Rey and the subversion of the public administration by Van Pol.»⁴⁸²

The attorney-general requested imprisonment of Van Rey for 2 years.

Obviously what is said about Van Rey applies at least as much to Wellink. But as we saw, in that much more important case the prosecutor refused to prosecute.

The misconduct of the public prosecutor with respect to Wellink's perjury should also be compared to its misconduct in the (Dutch) whistleblower cases described in the first part of chapter 8. There it can be seen that the prosecutor spares no efforts to harass innocent whistleblowers for as long as imaginable, and no inventiveness to show that it need not or cannot prosecute criminals who caused very much harm and obviously should be brought to justice. The simplest case is that of Ad Bos, section 8.5.

A copy of the letter to the public prosecutor, together with the report, was sent to the principal Dutch media and organizations of investigative reporters, to governmental advisory commissions whose mission statements or reports prescribed or suggested interest in the subjects treated by *Wellinks meeneed*, and for the same reason to the largest accountancy/ consultancy firms. In all, about 40 (forty) copies were sent. As far as I know, none of the media paid any attention to the prosecution request or the report. Even though this obviously was really "news".

Since parliament claims to supervise the proper operation of the Office of the Public Prosecutor, even if indirectly through supervision of the government, it seemed appropriate to inform it of the Prosecutor's refusal to prosecute Wellink, and- especially- his refusal to explain and defend his decision. The more so since in a month or two parliament would have to approve (or modify) the budget of the ministry of justice, which includes the budget of the Office of the Public Prosecutor. The answer was that parliament does not mingle in individual cases.⁴⁸³ Not only is this untrue, as will be shown in a minute, but the "policy" also means that parliament ignores an important if not essential source of information about the operation of an infinity of wholly or partially subsidized agencies. That parliament does mingle in individual cases is shown (for example!) by its reaction to the proposal to increase the salary of CEO Hamers of one of the largest banks in the Netherlands, ING. The increment was to consist of options, and was said to imply a 50% salary increase.⁴⁸⁴ Representatives of one political party after another said that this was unacceptable. One of the parties proposed a law requiring approval of salaries and/or salary increases by the minister of economic affairs.⁴⁸⁵ Haste was made in an effort to get the law approved before the shareholders meeting which was to decide about the salary increase. Some people suggested that by this action politicians meant to win votes in the coming elections for town councils. Whether this is true or not doesn't really matter: it doesn't change the conclusion that the behavior of the Dutch parliament is arbitrary and inconsequent. It is irresponsible: it makes a lot of fuss about something that doesn't hurt anyone, while covering up perjury and structural malfunctioning that guarantees catastrophe.

The rejection of the request to prosecute, though disappointing, did not come as a surprise. On the

⁴⁸² Press release of the Office of the Public Prosecutor (in Dutch: "Openbaar Ministerie") 14 November 2017.

⁴⁸³ The letter is an appendix of the webversion of WM.pdf.

⁴⁸⁴ Even after the increase, the salary is low as compared to the salaries of CEOs of US corporations with the same number of employees. Understandably this was given as the reason for the salary increase.

⁴⁸⁵ For the purposes of this work, details are completely irrelevant.

basis of the findings of the present report, a negative reply had seemed likely from the start. Prosecution, and a positive reply to my letter, would have justified serious doubts about the main conclusions of the report. If I wanted Wellink prosecuted, appeal would be necessary. But again, on the basis of the findings of this work, winning an appeal could not be taken for granted, irrespective of the solidity of the proof. I was particularly afraid of formal errors and juridical aspects unknown to ordinary citizens, but nevertheless essential for an appeal to be successful. It seemed to me that if I wanted to prevent unwilling people to kill the case without even having looked at the report, I would need competent legal assistance. That turned out to be much more difficult than expected. This surprised me, especially because (in the Netherlands) one often hears lawyers explain why even the worst "ordinary" criminals should be defended properly. The interest of the constitutional state, equality before the law, human rights and all that. After a few failed efforts, I came to expect reluctance. Since I didn't want to waste time and money, both being in short supply, I was quite explicit about what I wanted: competent help, of somebody believing in the merits of the case. After several "No"'s and unanswered mails, I struck a "Yes".⁴⁸⁶ However, a month later the lawyer's report showed that the firm should actually have said "No". The report argued that the appeal would almost certainly be rejected on formal grounds. It claimed that none of the allegations of the report could be proven objectively. It turned out that Article 12 of the law of criminal procedure does not allow citizens to appeal against a decision of a public prosecutor. Only a "moral person" whose purpose is involved by the alleged crime or prosecution can appeal. Which also meant that the assertion in the letters of the public prosecutor, that I could appeal, was simply untrue. I found this out by myself, at home, by reading the law (being amazed by the lawyer's report). I was quite a bit indignant about the absence of a remark in this vein in the lawyer's report. So I complained to the lawyer that her report did not indicate the possibilities, and that it failed to recommend establishing a foundation. Her answer was that making suggestions of that kind was not included in the assignment. Whereupon I noted that it was obvious from the beginning that I want Wellink prosecuted, and that I hired a lawyer in order to get all legal information that could be useful for the realization of that goal.

In support of its claim that *Wellinks meineed* provides no objective proof of perjury, the lawyer's report gives three examples. In my opinion at least one of them was incorrect. Objective proof seemed given or very well possible. The basic point however was, that a few (selected how?) examples prove nothing. The lawyer's report proved only one thing. Namely the inappropriate and unwanted attitude of the lawyer. The report should have shown efforts to find or construct proof. It should have shown the difficulties, and should have tried to overcome them. Find and indicate possible ways. I had researched the literature, and had seen how other lawyers go about and solve difficulties in similar cases. Perjury cases may be difficult, but they are not impossible to win.

So as regards the case, this firm made me none the wiser. Except that lawyers may cheat, and may bleed you rather badly before you can stop them.

⁴⁸⁶ Sjöcrona and Van Stigt, The Hague.

Chapter 7.

The financial crises of 2007-2013.

Part C. Appendices.

Principal persons and organizations in the (pre)history of the subprime crisis.

A litany of dysfunctioning and deceit.
With exceptions to prove the rule.

Table of appendices.

The table gives abbreviated appendix titles.

1. The Basel agreements
2. Bernanke
3. BIS
4. CFTC
5. CVs of members FCIC
6. DNB
7. ECB
8. Fed
9. GAO
10. Geithner
11. Graphs
12. Greenspan
13. IMF
14. Irish inquiries
15. Moody's
16. OCC
17. OECD
18. OFHEO
19. OTS
20. SEC
21. Wellink

Note.

This Appendix complements the reports of the FCIC and its staff, the reports of the CDW, and the reports of Pinto. It presents information which enables the reader to evaluate the operation of the financial supervisors in the prehistory of the financial crises. Such information is missing in the reports just mentioned. The Appendix is meant to fill the gap.

A small number of appendices has another motivation. They are only meant to give background and other useful information.

In general, information has not been included in the Appendix because it is not sufficiently important to be included in Chronicle or Analysis. It is included in the Appendix in order not to burden Chronicle and Analysis with a relatively large amount of information about a specific subject.

The appendices are independent of one another. They can be read in arbitrary order.

1. The Basel agreements.

Table of contents of this appendix.

- Evaluative concluding remarks.
- *The Basel Capital Accords*. By Joe Larson, April 2011.
- The book *From Basel I to Basel 3* by Laurent Balthazar.
- The presentation sheets of Tamer Bakiciol, Nicolas Cojocaru-Durand, and Dongxu Lu of 15/12/08.
- *Not What They Had in Mind. A History of Policies that Produced the Financial Crisis of 2008*. By Arnold Kling, September 2009.
- The Wikipedia (of 26/3/12) on the BCBS.

For the Basel agreements, Larson seems to be the best source. The others can be used for clarification and checks.

Evaluative concluding remarks.

1. The sources do not mention personal liability and punishability. While it is clear that:
 - a. personal liability and punishability can have a positive influence on risk taking and the quality of risk management;
 - b. the Basel agreements offer no guarantee;
 - c. given the possibly disastrous consequences of a failure of the Basel agreements, there should be a safety net
2. The origin of the 8% is not explained. Neither is the increase with 2,5% (of Basel II to III), nor the counter-cyclical rise of 2,5% and the bottom of 3%. It is logical that more capital means greater safety, but it is completely unclear how much capital ensures how much safety, and what risks remain. There is not the least reliable (scientific) foundation for the percentages, not even anything resembling an explanation. Because of the historical events and the fact that the people responsible for the crises are the same as those responsible for the Basel agreements, it must be assumed that the percentages are only guesses, and unreliable compromises of political negotiations.¹
3. For the national states, the Basel agreements are recommendations. The agreements have no power of law. States are free to do with them as they please. In general they have translated the Basel norms in laws and regulations. It is remarkable that the annual reports of the financial supervisors do not give critical discussions of either the Basel agreements or the way national states implemented them in laws. Doesn't their responsibility require an independent and critical attitude? Or are they in actual fact not as independent as politicians and they themselves want us to believe? The evidence, their silence, shows that they find loyalty towards governments, other supervisors, and the banks (with whom they negotiated the agreements) more important than loyalty towards those they are meant to serve, the citizens.
4. Both the Basel process and its results, the agreements, show gross incompetence. Which can be seen as part of the explanation of the financial crisis. This conclusion is consistent with the conclusions of the analysis of the other activities (and omissions) of the financial supervisors 1994-2008 .
5. Incompetence is social and organisational respects too. Note that Basel I is dated 1988, that Basel II came into effect in 2008, and that Basel III dates from 2010. 22 years after Basel I, and still ill-founded and risky. There is an immense unwillingness and/or incompetence to reflect critically and to safeguard outsiders.

¹ And never forget: a compromise between safe and unsafe is unsafe (always).

The Basel Capital Accords. By Joe Larson, April 2011.

This seems to be a sensible description and modestly critical evaluation of the Basel agreements. The article is readable and understandable. An agreement is first described, then discussed.

An asset is the opposite and pendant of a liability. See p. 11.²

Basel I. (Pp. 8-15).

«Basel I was the first coherent international attempt at regulating bank capital»³

In capital, two tiers are distinguished. The tier-division corresponds with a difference in quality.⁴ For assets 4 risk categories are distinguished. The capital requirement is 8%. This percentage only applies to the risk category with the highest risk. Larson gives the following examples:

Risk-Weight Category	Types of Assets Included in the Risk Category
0%	Cash; assets involving the governments of OECD countries
20%	Assets involving banks located in OECD countries; cash items in the process of collection
50%	Loans secured by mortgages on residential property
100%	Assets involving businesses; personal consumer loans; assets involving non-OECD governments (unless the transaction is denominated and funded in the same currency)

On p. 13 Larson summarizes the essence of Basel I as follows:

«[...] the bank must then ensure that value of its total capital levels (tier 1 + tier 2) are equal to at least 8% of the bank's risk-weighted assets, with tier 1 capital equalling at least 4% of risk-weighted assets.»

An important criticism held that one and the same category might include assets with widely varying real risks. This gave rise to regulatory arbitrage:

«Essentially, regulatory arbitrage describes a situation where, if a bank is presented with two options, both of which receive the same regulatory treatment, but each of which result in differing profit-making opportunities, the bank will choose the more lucrative option.»

Where “the more lucrative option” in practical reality means the *potentially* most lucrative option... (It may simultaneously cause the greatest risks).

The evaluation of Basel I is concluded with:

«In sum then, the common theme running through the criticisms of Basel I was that Basel I's method to determine the proper amount of capital to be held by a bank was not sufficiently or

² Page numbers always refer to sources.

³ Larson p. 13. Note that capital only needs regulation if liability is insufficient or absent, and does not produce similar (or better) effects.

⁴ «Tier 1 capital consists of higher-quality forms of capital, in the sense that it is comprised of items that have lower priority of repayment in the event that a bank becomes insolvent, and therefore have the greatest ability to absorb asset losses. Tier 1 capital consists primarily of “core capital.” Core capital, also known as common equity, represents items arising from pure ownership in the bank and includes the paid-in value of common stock, as well as the amount of any reserves (i.e., retained earnings) that the bank has accumulated and disclosed. Because these items arise from ownership in the bank, they have the lowest priority of repayment in the event of insolvency, and therefore represent the highest quality capital. As mentioned above, for a bank to be considered sufficiently capitalized under Basel I, it had to maintain a capital ratio of 8%. However, Basel I also required that half of this 8% consist of tier 1 capital (i.e., tier 1 must equal at least 4% of the bank's risk-weighted assets). Tier 2 capital is considered less reliable and is comprised of items such as subordinated debt and reserves held for loan-losses. Subordinated debt is debt (e.g., bonds) issued by the bank that the bank need not pay back until it has paid all its other creditors. » Pp. 8-9 of The Basel Capital Accords.

accurately connected to the actual risks confronting the bank.»⁵

Basel II. (Pp. 15-24).

«Basel II still requires that a bank's total capital equal at least 8% of the bank's risk-weighted assets. It also still assesses banks' capital adequacy using the same capital adequacy ratio, which is equal to a bank's capital divided by the bank's risk-weighted assets. Basel II did not alter Basel I's definition of capital, i.e., the numerator of the ratio. However, as will be seen below, Basel II, or more specifically, Pillar I, does alter how a bank arrives at the denominator, i.e. the calculation for risk-weighted assets.»⁶

«Pillar I was specifically designed to redress the deficiencies identified in Basel I. As such, Pillar I focuses primarily on reforming the method of measuring credit risk, i.e., the risk inherent in the bank's assets. The goal of these reforms is to ensure that the calculation of risk in a bank's assets more accurately reflects the actual risk in those assets, which should reduce the opportunity for banks to engage in regulatory arbitrage»⁷

Regrettably the pillars 2 and 3 lie outside the scope of the article by Larson, because they have no “direct bearing” on the calculation of “capital adequacy”. Fortunately Balthazar fills the gap.

Credit risk is to be measured by one of three approaches. In the standardized approach the four categories of Basel I are replaced by 6 new ones. The four categories of Basel I are retained, and two new ones are added: those of 35 and 150%. The classification corresponds with the ratings of the rating agencies. Not rated means 100%.⁸ In Basel I the rating did not matter. The table of Basel I is replaced by the following:⁹

Credit Rating (S&P)	Government Risk-Weighting	Private Counterparty Risk-weighting
AAA to AA-	0%	20%
A+ to A-	20%	50%
BBB+ to BB-	50%	100%
Below BB-	150%	150%
Unrated	100%	100%

For smaller banks the standardized approach is the most important. In the other «two approaches, banks can use their own internal methodology to determine the risk level of their assets». These two are called internal ratings-based (IRB) approaches.

Explanation of IRB approaches requires the concept “unexpected losses”. Larson defines it on pp. 18-9. Expected losses can be inferred from the historical record [how long?]. The description of the things which have to be taken into account in the calculation of “unexpected losses” shows that these losses are not really unexpected or unpredictable, and do not necessarily have small probabilities. Which is not to say that they correspond with systemic risks. The important point is that a bank has some autonomy in estimating unexpected-loss-risks. A rather crucial question would seem to be whether a bank can be required, to be able to, to explain its calculation to supervisors (inspectors representing a supervisor), to their satisfaction.

Criticisms were:

- The dependence on rating agencies, together with the fact that these agencies are paid by those for whom they rate. And they make errors too. Optimistic rating pays.

⁵ Larson p. 14.

⁶ Larson p. 15.

⁷ Larson p. 15-6.

⁸ Larson p. 17. Note that this should be at least 150 or 200% if avoidance of rating is to be discouraged.

⁹ Larson p. 18.

- Lack of uniformity, even in the standardized approach. There are different rating agencies, which rate differently;
- Too much uniformity: unrated borrowers are considered of equal quality and given equal weight (100%);
- In the IRB approaches there obviously is no uniformity either;
- For supervisors the internal implementation of IRB is difficult to evaluate- there is a risk of self regulation;
- «Another shortcoming of the IRB approaches is their tendency to promote procyclical bank behavior. In short, Basel II's regulatory structure has the effect of inducing banks to maintain lower amounts of capital during good economic times, which forces them to take economically harmful action in bad times to maintain sufficient capital.»¹⁰

According to the present author this procyclical behavior simply means bad risk management. It is ignored or taken insufficiently into account that good times don't last. Risk management is not sound if the possibilities of a downturn and bad times are not properly taken into account.

Basel III. (Pp 24-29).

This agreement dates from September 2010.

«Basel III does not replace Basel II, but rather augments it. The primary goal of Basel III is to improve the ability of banks to absorb asset losses without affecting the rest of the economy. In terms of capital regulation [...] Basel III focuses mainly on the quantity and quality of capital held by banks.»¹¹

The following provides some more detail.

A more stringent definition of capital.

«Among the most important parts of Basel III is its new definition of regulatory capital, which is more restrictive, and emphasizes greater quality. Basel III retains the tier 1 and tier 2 distinction, but limits their composition to higher-quality capital that is better able to absorb losses. Under Basel III, Tier 1 capital must be mostly of “core capital,” which consists of equity stock and retained earnings. In addition, many items that were formerly included in a bank’s capital calculation under Basel II, including some forms of subordinated debt, will be excluded under Basel III. Those capital instruments that will no longer qualify as “capital” under Basel III will be phased out of a bank’s capital calculation over a ten-year period starting in 2013. This transition period will help those banks that do not currently possess the sufficient amount and types of capital comply with the new requirements.»¹²

The maximum capital requirement is raised from 8 to 10.5%.

«In addition to increasing the quality of capital, Basel III increases the quantity of capital that banks must hold. By the time participating countries fully implement Basel III in 2019, banks are expected to maintain a total capital ratio of 10.5%, an increase from the 8% requirement under Basel II. As with Basel I and Basel II, banks under Basel III must maintain a minimum total capital ratio of at least 8% of risk-weighted assets. However, under Basel III, after a bank has calculated its 8% capital requirement, it will have to hold an additional capital conservation buffer equal to at least 2.5% of its risk-weighted assets, which brings the total capital requirement to 10.5% of risk-weighted assets. The purpose of the capital conservation buffer is to ensure that banks have sufficient capital levels to absorb asset losses, especially during periods of financial and economic stress.»¹³

But what is the basis for the percentages, and the rules?

¹⁰ Larson p. 23.

¹¹ Larson p. 24.

¹² Larson p. 24.

¹³ Larson pp. 24-5.

The tier 1 requirement is raised from 4 to 6%. Moreover:

«Under Basel III, banks will have to hold an amount of core capital equal to at least 4.5% of risk-weighted assets, whereas in the previous Basel Accords, core capital had to represent only 2% of risk-weighted assets.»¹⁴

In addition a counter-cyclical buffer of 2,5% is required:

«The amount of the counter-cyclical buffer will range from 0%-2.5% of risk-weighted assets. The exact amount of the counter-cyclical buffer will be decided by national regulatory authorities and will generally be determined by the amount of credit in an economy, with more credit leading to a higher buffer.»¹⁵

The requirement tries to preclude banks reducing capital in better times when the risks seem to be smaller. [They aren't. It seems that "risk" is defined inadequately].

With a counter-cyclical buffer of 2,5% the total capital amounts to 13% of risk-weighted assets.

A further raise of the capital requirement?

When Basel III was published, the Basel Committee on Banking Supervision (BCBS) announced that it would consult the Financial Stability Board (FSB) about the need of a further raise of the capital requirement. Larson had not heard the outcome when he wrote this article.

Leverage ratio $\geq 3\%$.

«As opposed to the risk-weighted capital ratios, which compare a bank's capital to the bank's risk-adjusted assets, Basel III's leverage ratio will compare a bank's capital level to its total assets, regardless of their risk level. By requiring a leverage ratio, Basel III ensures that banks maintain at least some amount of capital at all times, and thereby limits the ability of banks to engage in practices designed to evade minimum capital requirements.»

Criticism of Basel III.

«Critics who say the amount is too high point to the impact it will have on lending.»¹⁶ Namely $(8/13) \times 100\% = 61,5\%$ of what could be lent under Basel II.

«A report produced by the Institute of International Finance (IIF) (an organization representing banks) concluded that Basel III's requirements would result in a 3.1% drop in a nation's gross domestic product (GDP) for every 1% increase in a bank's capital ratio. In contrast, a similar report produced by the Bank for International Settlements (BIS) concluded that GDP would decrease by only 0.09% for every 1% increase in the capital ratio requirement.»

«[...] with the higher capital requirements, not only will there be less lending, but the lending that does take place will be more expensive and riskier.»¹⁷

According to Larson the long implementation period will at least cushion any possible negative side effects.

On the other hand there are critics who find the requirements too low still:

«On the other hand, there are critics who hold the opposite view, that the capital requirements imposed by Basel III are too low to ensure a bank can absorb losses of the same magnitude as those experienced during the financial crisis. In support of their argument, those calling for even higher capital requirements point out that many of the banks affected by the financial crisis, especially those in the United States, already had capital levels at or above the Basel III levels. Some studies even suggest that the necessary minimum capital ratio should be closer to 15%-20%, which would effectively double Basel III's requirements.

¹⁴ Larson p. 25. As regards the explanation of the different percentages: core capital is a part of tier 1.

¹⁵ Larson pp. 25-6.

¹⁶ Larson p. 27.

¹⁷ Larson p. 28. Why riskier? Larson does not give the explanation of the economists.

Maybe the biggest criticism of Basel III is what it fails to do. Many of the criticisms of Basel II go unaddressed in Basel III. For example, Basel III does not address the problems associated with Basel II's methods of assigning risk to a bank's assets- it does nothing to change the calculation of the bank's risk-weighted assets and leaves in place the use of external rating agencies to determine risk. Nor does Basel III do anything to harmonize the IRB approaches to prevent vastly different risk-weighting methodologies from bank to bank. Thus, while Basel III has attempted to improve the numerator of the capital ratio, it has done nothing to improve the denominator, which many would argue was what needed the most reform.»¹⁸

Reminder: the numerator is the capital, the denominator the assets.¹⁹

«VII. Conclusion

The international regime for bank regulation has evolved considerably since the BCBS was established in 1974. Yet, as the global financial crisis made clear, after the first two Basel Accords, there is still room for improvement in the regulation of bank capital. While it's too early to tell with any certainty, Basel III seems to be a step in the right direction. Yet, if the criticisms already put forth are any indication, Basel III may be just one of many steps yet to come.»²⁰

Liability and punitive damages are not discussed. All Basel agreements address only the banks. Not their employees. No personal liability or penalties are introduced, and nothing is done with respect to skewed compensation plans. See the opinions of Warren Buffet and Moody's employees as voiced in the FCIC hearings of 2/6/10, and quoted in the Moody's appendix.

From Basel 1 to Basel 3 by Laurent Balthazar, 2006.

(The book is dated 2006, the pdf file is dated 19/9/08).

This is a valuable source of more detailed information. The subtitle is witness to an era of arrogance and quasi-science:

«From Basel 1 to Basel 3

The Integration of State-of-the-Art Risk Modelling in Banking Regulation»

The “Basel 3” can only be meant to seduce prospective buyers. What the book says about Basel 3 is no better than speculation, even if quite reasonable, to a certain extent.

It is evident that the book was written before the crisis. The first sentence of The Future on p. 284 (in the Conclusions) reads: «Basel 2 is a tremendous improvement on Basel 1.»

About Basel 1 and Basel 2 the book provides more and more precise information than all other sources studied (until 31/12/13). It provides useful historical overviews of crises and regulation. It is readable and understandable. A pdf file is available and well organized. It has linked bookmarks.

In connection with the assertion that Basel I reduced capital and increased leverage it is useful to know the situation before Basel I. Box 1.2, about the history of banking regulation, on pp. 9-10, gives some information about this:

«1981.

Seeing the banking sector deteriorating, US regulators for the first time introduced a capital ratio at the federal level. Federal banking agencies required a certain level of leverage ratio on primary capital (basically equity and loan loss reserves: total assets). [...]

1983.

¹⁸ Larson p. 29.

¹⁹ Larson p. 8, above.

²⁰ Larson p. 29.

The US International Lending and Supervisory Act (ILSA) unified capital requirements for the various bank types at 5.5 percent of total assets and also unified the definition of capital.»

P. 27 gives a useful definition of market risk:

«In the Basel Committee document, market risk was defined as “the risk of losses in on- and off-balance sheet positions arising from movements in market prices.”»

Follows an inventory of specific risks.

This is of interest in connection with the adjustment of Basel I for market risk in 1996.

Box 2.1 on pp. 24 and following concerns regulation of market risk.

The sheets of the presentation by Tamer Bakiciol, Nicolas Cojocaru-Durand, and Dongxu Lu of 15/12/08.

«Purpose of banking supervision is

- to ensure that banks operate in a safe and sound manner.
- to ensure that banks "hold capital and reserves sufficient to support the risks that arise in their business".
- sound practices for banks' risk management»²¹

Below on this sheet one reads the following cryptic phrase:

«Economic Capital: trade off between profitability and insolvency»

Sheet 6 has the title “What is the Basel Committee?”. The sheet says something about the purpose and role of the Committee, and the historical perspective:

- «Basel Committee on Banking Supervision was established by the central-bank governors of the G10 countries in 1974
 - Belgium, Canada, France, Germany, Italy, Japan, Luxemburg, Netherlands, Spain, Sweden, Switzerland, UK, US;
- Meets at the Bank for International Settlements in Basel;
- Its objective was to enhance understanding of key supervisory issues and improve the quality of banking supervision worldwide;
- Not a formal supranational supervisory authority and conclusions do not have legal force;
- Formulates broad supervisory standards and guidelines;
- First major result was the 1988 Capital Accord;
- 1997 developed a set of "Core Principles for Effective Banking Supervision", which provides a comprehensive blueprint for an effective supervisory system.»

The history of the Basel agreements is summarized as follows:

- «Basel I Capital Accord (1988)
 - Amendment to the capital accord to incorporate market risks (1996)
- Basel II Capital Accord
 - First Consultative Paper (1999)
 - Second Consultative Paper (2001)
 - Third Consultative Paper (2003)
 - Final Document (2004)
 - “Basel II: International Convergence of Capital Measurement and Capital Standards: a Revised Framework”
 - Amendment (2005)
 - The Application of Basel II to Trading Activities and the Treatment of Double Default Effects

²¹ Sheet 4.

- Final Version(2006)
 - “Basel II: International Convergence of Capital Measurement and Capital Standards: A Revised Framework -Comprehensive Version”
- Proposed revisions to the Basel II market risk framework (2008)»²²

Basel II was motivated by the following problems with Basel I:

- «Club-rule (being a member of OECD) is not meaningful in terms of riskiness;
- “Broad brush” and lacks risk differentiation: one size fits all;
- Divergence between Basel I risk weights and actual economic risks;
- Regulatory arbitrage (Solved?);
- Inadequate recognition of advanced credit risk mitigation techniques (securitization and CDS).»²³

The objectives of Basel II are revelatory:

- «Eliminate regulatory arbitrage by getting risk weights right;
- Align regulation with best practices in risk management;
- Provide banks with incentives to enhance risk measurement and management capabilities.»

This breathes the spirit of deregulating and belief in self control. This interpretation is confirmed by the following sheet.²⁴ It presents the following scheme:

Pillar 1	Pillar 2	Pillar 3
Minimum Capital Requirements: <ul style="list-style-type: none"> • Risk management incentives • New operational risk capital charge • Risk weighted assets (RWA) for credit more risk sensitive • Market risk largely unchanged 	Supervisory Review: <ul style="list-style-type: none"> • Solvency reports • Regulatory review • Capital determination • Regulatory intervention • Addresses risks that are not captured in Pillar 1 like concentration, interest rate, and liquidity risks 	Market Discipline: <ul style="list-style-type: none"> • Minimum disclosure requirements • Scope • Capital transparency • Capital adequacy • Risk measurement & management • Risk profiling

Basel I distinguishes 3 kinds (“tiers”) of capital. They are described in the sheets 15 en 16.

The following scheme shows the most important difference between Basel I and Basel II:

Credit Rating	AAA to AA-	A+ to A-	BBB+ to BB-	Below BB-	Unrated
Basel I Risk Weight	100%	100%	100%	100%	100%
Basel II Risk Weight	20%	50%	100%	150%	100%

The next scheme illustrates an obvious improvement of Basel II with respect to Basel I:

²² Sheet 7.

²³ Sheet 9. Note that the objections are not independent.

²⁴ Sheet 11.

OECD Country	S&P Sovereign Rating	Risk Weight (Basel I)	Risk Weight (Basel II)
Turkey 	B-	0%	100%
Mexico 	BBB+	0%	50%
Korea 	A	0%	20%
Germany 	AAA	0%	0%

Ratings as of Sept. 2001

Sheet 31 shows how banks try to minimize capital requirements:

- «Just like you can buy life insurance, banks can protect themselves against defaults by buying Credit Default Swaps (CDS);²⁵
- This exposes them to counterparty risk however;
- They can also get rid of bad loans/risky exposure (even CDS) by repackaging assets in CDOs which are housed off balance-sheet.»

Under the heading “Regulatory arbitrage” sheet 33 reads:

- «In hindsight, SIV’s enabled banks to house risky assets outside the scope of Basel rules;²⁶
- Because of the diversification coming from the pooling of risky assets, the tranches issued had higher credit ratings;
- Limited provisions were made for the liquidity clause banks had with their SIV’s especially if they issued short-term assets (ABCP);²⁷
- Combined, this reduced regulatory capital to be held and enabled more risk-taking.»

Sheets 36 and 37 discuss problems with the value-at-risk-approach (VaR) for the management of market risk.

The idea of market discipline was that the market requires banks to behave properly. The market can only do this (in a reasonable way) if the banks are transparent in all essential respects, and if supervision works properly.²⁸ Under the heading “Market Discipline” sheet 45 says the following about this condition:

«The third pillar greatly increases the disclosures that the bank must make. This is designed to allow the market to have a better picture of the overall risk position of the bank and to allow the counterparties of the bank to price and deal appropriately.»

The last sheets present some evaluative remarks.

²⁵ In important respects, the comparison is false. For life insurances statistics really apply. Not so for the things “insured” by CDS. The value of assets insured by CDS probably vary in a correlated fashion. The orders of magnitude of the amounts of money involved differ enormously. Combined with correlations they may more easily bring the insurer (CDS issuer) in difficulties. Already by the end of 2008 this could have been understood, given the difficulties of the monolines.

²⁶ SIV= structured investment vehicle. It is a corporation in the sense of a body formed and authorized by law to act as a single person.

²⁷ ABCP= asset backed commercial paper.

²⁸ At least the note on supevision is made by the present author.

Not What They Had in Mind. A History of Policies that Produced the Financial Crisis of 2008. By Arnold Kling, September 2009.

Available on the internet as a pdf file.

On p. 40 Pinto refers to this book for an excellent discussion of the impact of the Basel Accords on the financial crisis.²⁹

Chapter 6 on pp. 22/24 and following discuss capital regulation. Among other things the chapter shows that the risk increasing effects of Basel had been foreseen by the Shadow Regulatory Committee, a group of economists offering independent opinion on bank regulation. It also shows that publications of Fed employees show that these employees understood that regulatory arbitrage took place. Kling presents their reasons for considering this positive:

«In essence, the author argued:

- The Basel risk buckets were arbitrary.
- The risk classifications may have been overly conservative for certain types of loans.
- Regulatory Capital Arbitrage (RCA) enabled banks to reduce the capital requirements for these loans.
- RCA was difficult to stop politically.
- RCA did not necessarily harm safety and soundness if it kept banks competitive in markets to make low-risk loans.

What is striking about the paper is the degree to which the regulator shows understanding and support for the banks' use of securitization and off-balance-sheet entities to reduce capital requirements. Because we know what happened subsequently (the paper was published in 2000), reading the Jones paper is like watching a movie in which we see how a jailer becomes sympathetic to the plight of a prisoner, while we know that eventually the prisoner is going to escape and go on a vicious crime spree.»

“The author”, Jones presumably, gives an excellent example of wishful thinking. Several arguments can be turned around, and the political “argument” is no argument at all.

The Wikipedia (26/3/12) about BCBS.

«[The Basel Committee on Banking Supervision (BCBS)] was formed in response to the messy liquidation of a Cologne-based bank (Herstatt Bank) in 1974. On 26 June 1974, a number of banks had released Deutsche Mark (German Mark) to the Bank Herstatt in exchange for dollar payments deliverable in New York. On account of differences in the time zones, there was a lag in the dollar payment to the counter-party banks, and during this gap, and before the dollar payments could be effected in New York, the Bank Herstatt was liquidated by German regulators.

This incident prompted the G-10 nations to form towards the end of 1974, the Basel Committee on Banking Supervision, under the auspices of the Bank of International Settlements (BIS) located in Basel, Switzerland.»

«[This] Committee consisted of representatives from central banks and regulatory authorities of the Group of Ten countries plus Luxembourg and Spain. Since 2009, all of the other G-20 major economies are represented, as well as some other major banking locales such as Hong Kong and Singapore. (See the Committee article for a full list of members.)

The committee does not have the authority to enforce recommendations, although most member countries as well as some other countries tend to implement the Committee's policies. This means that recommendations are enforced through national (or EU-wide) laws and regulations, rather than as a result of the committee's recommendations- thus some time may pass between recommendations and

²⁹ Pinto *Government Housing Policies in the Lead-up to the Financial Crisis: A Forensic Study*. Dated 14/8/10. (Pdf file created and modified 12/9/10).

implementation as law at the national level.»

2. Ben Shalom Bernanke.

Table of contents of this appendix.

- Summary and conclusions.
- Biographical information.
- Bernanke in the film *Inside job*.
- The Morehouse speech of 14 April 2009.
- The hearing of Bernanke by the FCIC on 2 September 2010.
- Bernanke in the FCIC-report.

Summary and conclusions.

1. Bernanke was an economist, educated at the best universities of the USA. He was awarded a PhD, and became chairman of the economics faculty of Princeton University.
2. He was specialized in depression and crises.
3. But did not understand that the financial system is unstable.
4. He made a fatal error of judgment regarding the GAO reports of 1994-1999.
5. Was governor at the Fed as of 2002.
6. Was chairman of the Fed as of 1 February 2006.
7. In answer to a question of the FCIC asserted under oath that the Fed is not responsible for systemic risk.
8. Before the crises he ignored or grossly underestimated warnings.
9. His conduct during the crisis was unprepared and inconsistent.
10. In the light of his other conduct and assertions, his explanation of the management of the Lehman crisis lacks credibility.
11. Bernanke speaks as if he impersonates the Fed. He shows no awareness of the fact that he is head of an organization with more than 1500 employees with their own and in general different competencies and thoughts.
12. The facts indisputably show Bernanke to be insufficiently honourable and competent.
13. (Purported) Academic performance is not a reliable indicator of performance on the job.
14. On his way up Bernanke was never evaluated correctly. Those who recommended him either lacked integrity or competence, or both.

Biographical information.

The following biographical material is based on the Wikipedia page Bernanke of 6/3/12. The text has been edited slightly; sometimes on the basis of simple but not 100.00% certain assumptions: the wiki-page is not consequent as regards methods. Some dates are missing for example.

«Date of birth: December 13, 1953

Place of birth: Augusta (Georgia, USA)

Education:

Bernanke attended Harvard University, where he lived in Winthrop House with the future CEO of Goldman Sachs, Lloyd Blankfein, and graduated with a Bachelor of Arts in economics summa cum laude in 1975.

He received the doctor of philosophy degree in economics from the Massachusetts Institute of Technology in 1979 after completing and defending his dissertation, *Long-Term Commitments, Dynamic Optimization, and the Business Cycle*. Bernanke's thesis adviser was the future governor of the Bank of Israel, Stanley Fischer, and his readers included Irwin S. Bernstein, Rudiger Dornbusch, and Robert Solow of MIT and Peter Diamond and Dale Jorgenson of Harvard.

1979-1985: Bernanke taught at the Stanford Graduate School of Business.

?-?: visiting professor at New York University

?-1/7/05: tenured professor at Princeton University in the Department of Economics.

1996-2002: tenured professor at Princeton University and chairman of the department of economics. In September 2002 he went on public service leave.

2002-2005: member of the Board of Governors of the Federal Reserve System.
21/5/05-31/1/06 chairman of Bush's Council of Economic Advisers.
1/2/06->11/12/12: chairman of the Fed. Appointed by G W Bush, and 1/2/10 re-appointed by Obama.»

[At the Fed] «he outlined the Bernanke Doctrine and first spoke of the Great Moderation, where he postulated that we are in a new era, where modern macroeconomic policy has decreased the volatility of the business cycle. [This was the text of the wiki-page on 6/3/12. On 24/7/12 it said:] [...] “the Great Moderation”—the theory that traditional business cycles have declined in volatility in recent decades through structural changes that have occurred in the international economy, particularly increases in the economic stability of developing nations, diminishing the influence of macroeconomic (monetary and fiscal) policy.»

«In 2002, following coverage of concerns about deflation in the business news, Bernanke gave a speech about the topic. [The speech was entitled: Deflation: Making Sure "It" Doesn't Happen Here]. In that speech,³⁰ he mentioned that the government in a fiat money system owns the physical means of creating money.³¹ Control of the means of production for money implies that the government can always avoid deflation by simply issuing more money. He said "The U.S. government has a technology, called a printing press (or today, its electronic equivalent), that allows it to produce as many U.S. dollars as it wishes at no cost." (He referred to a statement made by Milton Friedman about using a "helicopter drop" of money into the economy to fight deflation.) Bernanke's critics have since referred to him as "Helicopter Ben" or to his "helicopter printing press." In a footnote to his speech, Bernanke noted that "people know that inflation erodes the real value of the government's debt and, therefore, that it is in the interest of the government to create some inflation." For example, while Greenspan publicly supported President Clinton's deficit reduction plan and the Bush tax cuts, Bernanke, when questioned about taxation policy, said that it was none of his business, his exclusive remit being monetary policy, and said that fiscal policy and wider society related issues were what politicians were for and got elected for.»

About “the Great Moderation” the FCIC-report says:

«“Recessions have become less frequent and less severe,” said Ben Bernanke, then a Fed governor, in a speech early in 2004. “Whether the dominant cause of the Great Moderation is structural change, improved monetary policy, or simply good luck is an important question about which no consensus has yet formed.”»

So maybe it was simply good luck. Note that one could only talk this kind of nonsense in 2004 if one ignored the reports with warnings, if one had no idea of the instabilities in the system (and therefore of previous crises), and no idea of the notion that small causes may have large effects.

In his hearing by the FCIC on 2/9/10 Bernanke nevertheless claims competence in the field of crises:

«WITNESS BERNANKE: So first of all there was of course, we were trying to arrange a private takeover over the weekend, and we wanted that to be done on the best possible terms that we could. And for that reason there was some benefit I think in the weeks prior to Lehman to keep our hands, you know, a little bit up to the vest in terms of what we were willing and able to do. So there was some of that going on in the week prior to the Lehman weekend. That being said, let me just state this as unequivocally as I can. As you know, **before I came to the Fed Chairmanship I was an**

³⁰ For the source see (also) FCIC p. 85/113.

³¹ Fiat money is currency which derives its value from government regulation or law. (From Wikipedia 24/6/15).

academic, and I studied for many years the Great Depression, financial crises, and this is my bread and butter. And I believed deeply that if Lehman was allowed to fail, or did fail, that the consequences for the U.S. financial system and the U.S. economy would be catastrophic. And I never, at any time, wavered in my view that we should do absolutely everything possible to prevent the failure of Lehman.»³²

But Lehman was allowed to fail nevertheless. Bernankes report of the decision making with respect to Lehman does not seem to be consistent, tenable, and credible. It seems permeated with convenient hindsight arguments. Bernanke had become a member of the Board of Governors of the Fed in 2002. But in the record of the Fed of the last decade no indication could be found of any of his insights or fears.

Bernanke in the film *Inside job*.

At about 55 minutes in the documentary, at the beginning of Part III, Bernanke is shown as saying in July 2005 that there has never been a nationwide fall in house prices. He refuses to consider the eventuality.

He declined to be interviewed for the film.³³

The Morehouse speech of 14 April 2009.

On 14/4/09 Bernanke gave a speech at Morehouse College, Atlanta, Georgia. He answered four questions:

1. How Did We Get Here?
2. What Is the Fed Doing to Address the Situation?
3. Does the Fed's Aggressive Response Risk Inflation Down the Road?
4. Why Did the Fed and the Treasury Act to Prevent the Bankruptcy of Some Major Financial Firms?

His answer to question 1 is an explanation of the (subprime) crisis:

«Saving inflows from abroad can be beneficial if the country that receives those inflows invests them well. Unfortunately, that was not always the case in the United States and some other countries. Financial institutions reacted to the surplus of available funds by competing aggressively for borrowers, and, in the years leading up to the crisis, credit to both households and businesses became relatively cheap and easy to obtain. One important consequence was a housing boom in the United States, a boom that was fuelled in large part by a rapid expansion of mortgage lending. Unfortunately, much of this lending was poorly done, involving, for example, little or no down payment by the borrower or insufficient consideration by the lender of the borrower's ability to make the monthly payments. Lenders may have become careless because they, like many people at the time, expected that house prices would continue to rise- thereby allowing borrowers to build up equity in their homes- and that credit would remain easily available, so that borrowers would be able to refinance if necessary. Regulators did not do enough to prevent poor lending, in part because many of the worst loans were made by firms subject to little or no federal regulation.

Mortgage markets were not the only ones caught up in the credit boom. The large flows of global saving into the United States drove down the returns available on many traditional long-term investments, such as Treasury bonds, leading investors to search for alternatives. To satisfy the enormous demand for investments both perceived as safe and promising higher returns, the financial
